Estate duty has been paid on £104,220, as the value of the personal estate of Mr. Thomas Chatfeild Clarke, of 132, Westbourne-terrace, and Oakfield, Wootton, Isle of Wight, and of 63, Bishopsgate-street Within, architect and surveyor, formerly a member of the School Board for London, and a candidate in the Liberal interest for the Parliamentary representation of Poole, Hammersmith, and Grantham. Mr. Clarke bequeathed to University College Hospital, £200; to the London Domestic Missions Society, £200; to the Sustentation Fund for Augmentation of Ministers' Stipends (of which he was treasurer), £200; to the British and Foreign Unitarian Association, £200; to the Royal Isle of Wight Infirmary, £100; and to the Society for the Prevention of Cruelty to Children, £100. The bulk of the property is left to members of the deceased's family. It is significant that, although Mr. Chatfeild Clarke was an ardent advocate for Home Rule, the trustees are authorised to invest upon the security of landed estate in England and Wales only.

Mr. T. H. Crasp believes there are few trees which cannot be safely lifted. He has lifted many kinds of conifers and deciduous trees in different parts of the country, and under varying conditions of soil and climate, and claims that the results have been uniform. Conifers of heights ranging from 20ft. to 50ft. and proportionate diameter, have been lifted, and in some cases conveyed a distance of several miles without any real injury. Magnificent retinosporas, 12ft. to 15ft in height, Portugal laurels of great age, fine hollies, horse-chestnuts, and copper-beech, with large laburnums, and scarlet thorns, and many others have been lifted with equal success. The yew-tree in Buckland churchyard, near Dover, is an example of a very old and large tree which was successfully moved a few years ago from one spot to another without being injured. The tree, which it is said was mentioned in the Domesday Book, was well watered after transplantation, and is now in the best of health.

Under the active presidency of the Earl of Derby, a vigorous effort is being made by the British Dairy Farmers' Association to give a helping hand to one of the most important branches of agriculture—dairy-farming, and its allied industry of poultry-raising. At the twentieth annual London Dairy Show, to be held at the Royal Agricultural Hall in October next, prizes to the value of £2,515, in addition to 142 gold, silver, and bronze medals, are offered for competition in 451 different classes, in many of which a keen contest is already assured. This handsome total is due to the fact that the Association have this year been generously supported by liberal contributions to the prize fund from the Corporation of the City of London, the Poulters' Company, the President (Lord Derby), Mr. Titus Barham, Sir James Blyth, Bart., and others, the last-named gentleman giving £400 as prizes for plans and models of dairies adapted for the manufacture of butter and cheese. Altogether the exhibition, which will include every department of the dairy, promises to be exceptionally comprehensive, attractive, and—what is of the greatest importance—helpful to the struggling British farmer.

The last of the scaffolding has disappeared from the façades of the new National Portrait Gallery, and the hoarding has been removed from the whole of the east frontage. The inclosure before the north elevation, facing Charing-cross-road, still remains, as the open space that has been cleared is being flagged. The gallery, it will be remembered, has been erected at a cost of about £96,000 by Messrs. Shillitoe and Sons, of Bury St. Edmund's, from designs by the late Mr. Ewan Christian. Mr. Lionel Cust, who recently succeeded the late Sir George Scharf as director, is now busily engaged in arranging and hanging the collection of portraits, which have all been transferred from Bethnal Green. Some of the pictures are being renovated, and all the frames are being cleaned, regilded, or renewed. The gallery will not probably be formally opened until Easter next.

The "hygienic aspect of wood pavements" is a question discussed in the *Lancet* of last week. The writer refers to the report of Mr. Wynter Blyth on the health of St. Marylebone. That gentleman has been experimentally inquiring into the rival claims of wood and asphalte. The saturation of the former with horse excreta, &c., is mainly referred to. Mr. Blyth has found, it is stated, by examining blocks laid down in Oxford-street during the last six years, that "in a block taken from the centre of the road the greatest pollution was found in the upper slice, although the block was permeated with pollution." He took the upper, middle, and lower slices of blocks for his tests. In blocks taken from the side of the road the greatest amount of pollution was found in the lowest slice, and much in excess of the block taken from the middle of road. The moisture penetrates the joints in the middle of road, and on reaching the impermeable bedding passes down to the sides of the roadway, and so saturates the lowermost layers of the side blocks. Mr. Blyth thinks asphalte is the best form of pavement as being proof against saturation. He admits, however, its noisiness and slipperiness. The latter is a very strong objection, and one which must be overcome by some means of grooving, &c., before asphalte surfaces can be again tolerated.

The final meeting in connection with the curriculum of the course of instruction for practical foresters and gardeners, which has been in progress since 1892, by arrangement between H.M. Commissioners of Works and the Board of Agriculture, took place in the lecture hall of the Royal Botanic Garden, Edinburgh, on Tuesday night, when a prize of £10, given by General Michael, of Ascot, one of the pioneers of Indian forestry, was awarded to John Fowler, Annand, Aberdeen, as the forester who has done best in the examinations over the whole course; and the second prize of a microscope, given by Mr. Robert Dundas, of Arniston, was awarded to William Davidson, Brechin. Professor Bayley Balfour congratulated the men upon the enthusiasm with which they had entered upon and carried through the educational experiment which now came to an end in the Garden so far as most of them were concerned. Some of them had expressed a wish to go to Germany to gain a practical insight into German forestry, and this, he hoped, would be arranged for through the Board of Agriculture. The Professor then announced that the new curriculum would begin in October.

Two new sky-scraping structures are, says the *American Architect*, now in course of construction in St. Louis, Missouri. One of them, the Chemical Building, by Mr. Henry Ives Cobb, of Chicago, is to be sixteeen stories in height, a greater number than in any building in St. Louis. The design shows a very plain building in the Romanesque style. It will be surmounted by a roof-garden, which will practically form a seventeenth story. The estimated cost of the structure is £150,000 sterling, but an outlay of £200,000 will represent the entire investment. The entire ground floor will be occupied by the Chemical National Bank. The other structure, the Century Building, will be a more elaborate and costly undertaking than the one just mentioned. It will front on three streets, Locust-street, Olive-street, and Ninth-street, being located one block west of the Chemical Building, and across the street from the general post-office. The cost of the building alone will be in excess of £200,000. It is to be a combined theatre and office-building, the Chemical Building being for offices only. The structure is to be twelve stories in height, and built entirely of Georgia marble. The two upper stories are to be occupied by a secret society. In the same city a Jewish synagogue is now being converted into a theatre, to be called the "Oriental," and a third theatre is being built on Pine-street.

The completion of the largest gas-holder in America, in connection with the largest metal tank ever constructed, is announced. The holder in question has been built by Messrs. R. D. Wood and Company, of Philadelphia, for the New York and East River Gas Company, at their works in Ravenswood, Long Island City, nearly opposite Sixty-Fourth-street, New York City. It has a capacity of five million cubic feet. It is the first holder of importance built in the United States with the inner lift rising above the top of the guide-frame when fully inflated. The general dimensions of the holder are as follows:—First or inner lift, 179ft. diameter by 48ft. 6in. deep; second lift, 182ft. by 49ft.; third lift, 184ft. 6in. by 48ft. 6in.; fourth or outer lift, 187ft. by 49ft. 2in.; steel tank, 190ft. by 49ft. 6in.; guide frame; 24 standards, 148ft. high; five tiers of latticed girders. The tank rests upon a concrete foundation, the space under the bottom plates being filled with a cement grouting run through holes in the plates after the bottom was lowered upon the foundation. The top of the tank shell is stiffened by a horizontal plate girder, 48in. wide, which serves as a walk around the tank, extension plates being placed back of each standard to permit passage. When the holder is fully inflated, the crown is over 40ft. above the top girder, and is reached by means of a chain ladder kept taut by a weight on its lower end, working in guides. When the holder is filled with gas, the crown is 240ft. above the level of the ground. The largest holder of the world is that built by Messrs. Clayton and Sons, for their South Metropolitan Company, at East Greenwich, London, and which possesses the capacity of 12,200,000c.ft.

On Thursday in last week the police committee of the Belfast Corporation approved of the designs submitted by the assistant city surveyor for new divisional fire-station in Whitla-street and Duncrue-street, close to the harbour, on a site offered by the harbour commissioners.

On Thursday afternoon in last week, the Bishop of Portsmouth, the Rev. Dr. John Virtue, laid the foundation-stone of a new Roman Catholic Church about to be erected in the rear of the Convent of the Cross, Parkwood-road, Boscombe, near Bournemouth. The new church is principally the gift of an anonymous donor, is intended to seat 400 worshippers, and has been designed by Mr. J. W. Lunn, of Great Malvern, the contractors being Messrs. Jenkins and Sons, of Portsmouth. It will take the place of the iron structure erected some eight years ago.

Mr. Bramwell Davies, Q.C., has just published his award in connection with the arbitration proceedings between the Metropolitan Bank and the liquidators of the National Bank of Wales to determine the value of the Dean Forest Navigation Collieries, which formed part of the assets of the National Bank. The amount claimed by the National Bank was £27,000, exclusive of railway waggons. The Metropolitan Bank contended that the collieries were worthless, and offered £5,000 for the plant. The arbitrator has fixed the value of the property at £13,000.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2122.
FRIDAY, SEPTEMBER 6, 1895.

PROFESSIONAL CHARGES AND BUILDING NEGOTIANTS.

"EVERY man," says the lawyer in one of Fielding's novels, "ought to have a proper regard for his fee." It is a virtue in which lawyers are seldom supposed to be wanting, and, judging from the amounts at which their estates are often valued for testamentary purposes, it seems to bring its own reward. The legal profession, however, is one which a man is hardly likely to enter for mere love of it. Its honours and its prizes, and not the intrinsic attractions of its work, are what keep its ranks so full. It is otherwise with our own—at least, in its higher branches. To succeed in producing art of any kind is one of the greatest of intellectual pleasures. To produce one of its most lasting varieties is the privilege of the architect; and his temptation, when he is anything of an artist, is to put his fees into an altogether subordinate place. This is natural, but not wise. People would care more for architecture if they paid more for it. When they get it at all, they get it too easily. More than this, they get all qualities of it—from the worst to the best—at about the same price, and they consequently infer that the difference between one quality and another is insignificant, instead of being almost infinite.

The schedule of professional practice and charges is now being, or is just about to be, considered by the practice committee of the Institute, with a view to possible modifications. This particular committee, as is well known, does not largely represent the artistic element in the profession. We may take it, perhaps, speaking generally, as standing for that large and prosperous section of gentlemen concerned with building matters, for whom the title of architect is a misfit. They are useful, and almost indispensable; but they are much more at home in the surroundings, the preliminaries, and the preparations for architecture, than in architecture itself. They are skilled in negotiations—they are clever at contracts—they know all about freeholds and leaseholds and copyholds—they are admirable at valuations, and can prove the same plot of land to be worth £500 or £5,000 with equal ease—they understand the laws connected with building, the decisions about light and air, repairs and dilapidations—they are in their natural element as arbitrators, though, of all people in the world, they are the most incapable as competition assessors. It seems odd that they should be grouped with architects, just as it seems odd that barbers were formerly grouped with surgeons. The one grouping has ended: it was too absurd to last; in years to come, the other will probably end likewise. The "building negotiants," as we may term them, will some day form a profession of their own—and it will be well, both for architecture and architects, when they do so.

It will be well for architecture, because these gentlemen, who have quite enough to think about in their own proper work, will then be under less temptation to go beyond it. The qualities of mind which conduce to success in their legitimate calling are pretty much those which constitute the sharp solicitor. Till the millennium arrives they will "fetch their price in the market"; but it is only by a sort of miracle that they can ever be combined with the invention and imagination and good taste which go to the making even of the smallest particle of real art. On the other hand, the separation will be good for architects, because they will no longer be expected to pose as authorities on subjects which lie quite outside their true vocation. As matters are now, they profess to understand a great deal too much. They let their clients suppose that they can not only design their buildings properly, and get them properly built, but that they can also do all the other things for them which the "building negotiant" can do. It is an absurd pretension which leads to endless trouble. No one man, with the rarest exceptions, can possibly be both a real architect and a real building negotiant; but when he has led outsiders to think that he can, and has induced them to employ him in consequence, the law courts naturally punish him when he fails.

The Institute Schedule, it is true, does not confuse the duties of the architect with those of the "building negotiant." It states that the professional services included in the ordinary charge of 5 per cent. are the following: "The requisite preliminary sketches, drawings, and specifications sufficient for an estimate and contract; detailed drawings and instructions for execution, one set of tracings, and duplicate specification; general superintendence of works (exclusive of clerk of the works), and examining and passing the accounts, exclusive of measuring and making out extras and omissions." These, according to the schedule, the architect has to provide. It expressly states that his charges "do not cover professional services in connection with negotiations for site, in surveying it and taking levels, in making surveys and plans of buildings to be altered, in arrangements respecting party-walls or rights of lights, nor services incidental to arrangements consequent on the failure of builders whilst carrying out work, or in cases of subsequent litigation; but all such services are charged for in addition." There is no doubt these things ought to be charged for in addition, but in many cases they are not. Clients are allowed to suppose that 5 per cent. covers everything that an architect may have to do in connection with a building under any conceivable circumstances, and the result is that either no claim can be made when such circumstances arise, or that clients think the claim a gross imposition.

To prevent quarrels, there is nothing like having a clear understanding at the outset. Three-fourths of the actions about architects' charges would never have been begun if the Institute Schedule had been put into the clients' hands at starting. It is a question whether the rule of some colonial associations of architects might not be adopted here—by which it is made the duty of every member to forward at once a copy of its schedule to everyone from whom he accepts a commission, and to state that on it his charges will be based. There are certain points in the Institute Schedule, however, about which special agreements may be, and often are, made. It is seldom, perhaps, that time occupied in travelling can be charged for. When several similar buildings are erected at once, a preliminary agreement as to terms is required. For small works, for furniture, fittings, and decoration, the 5 per cent. commission is admittedly insufficient. But the popular idea is that 5 per cent. covers everything, and this makes it extremely difficult to obtain anything beyond it. Yet, by itself, it is miserably inadequate to the work performed, except in the plainest and simplest of buildings. The public think it enormous, because they are utterly ignorant of the time and trouble required for architectural work. "I thought the perspective view and the plan were all the drawings needed," a secretary of a church-building committee remarked some time ago to his architect; "and it seemed to me that your charges were outrageous. Now I see all the drawings, and details, and documents, and the correspondence required, I do not much envy you your appointment."

Except for architects of the very highest reputation, there is no chance of raising the rate of commission. Even if it could be raised, it does not follow that much would be gained. Physicians and consulting surgeons are said to be worse off, rather than better, for the decision they arrived at a few years since to make the fee for a first interview two guineas instead of one. So it would be with us if our 5 per cent. were raised to 7 or 10. Too many buildings are put up without architects as it is, and many more would fall into the same class then. It is not in this direction, but in quite a different one, that we may discern a possibility of making architecture a paying profession. A most important move in this direction would be to mark clearly the distinction between the profession of architect and that of building negotiant. The same man may still practise, or attempt to practise, both, just as the same man may be an architect and a quantity surveyor. But the point is to make the public see that in such a case he is practising two separate professions, not merely one, and that if they employ him in both they must pay him for both. As it is, they often make their architects do the work of a building negotiant, and then calmly assume that his five per cent. commission covers it all. It is true he can bring up the Institute Schedule of Charges against them. In that case, they may defer to it and pay, or they may object to it and leave him to bring an action; but, in either case, they will feel ill-used, and will be his enemies rather than his friends for the future. This would not happen if we could draw a sharp line, visible to all the world, between the building negotiant's duties and the architect's. Clients would then be ready to pay the architect his 5 per cent. for strictly architectural work, and would not expect him to take up a separate profession and exercise it gratuitously for their benefit. For the semi-legal building affairs, their light and air questions, their liabilities to repair, and their dilapidations and valuations, they would go to the building negotiant and pay him his own fees, so that he would get a great deal to do, and be paid for doing a great deal, which now improperly falls upon architects, and for which, in the majority of cases, they are not paid at all. The public, it is true, would then have to pay for this sort of advice and assistance; but by getting it from specialists who devoted their whole abilities to it, they would have value for their money. As it is, they must often find that what costs nothing is worth nothing.

An ideal schedule of charges would concern itself wholly with the work of the architect. It would leave the building negotiant, as such, out of sight altogether, unless, perhaps, by casually remarking, as the Institute Schedule does about the quantity surveyor, that his fees are not included in the 5 per cent. commission. It would give a clear and exhaustive statement of the things which an architect has to do, and would make it plain that when he has done them his responsibility ends. Possibly it might be desirable to issue a quite separate schedule relating to the building negotiant's fees; but the point is to keep the two professions palpably, obviously, and utterly distinct in the eyes of the world. The public would then cease to expect their architects to do a quantity—in some cases immense—of very troublesome business, which has no real connection with their work. They would go to the proper persons for it, pay for it honestly, and get it properly done. The architects' schedule might then be shortened and simplified, so that not only juries, but even judges themselves, would clearly comprehend it.

This is the first and great reform that is needed: alike in the interest of architects, building negotiants, and the public. But the Institute Schedule also wants revising in smaller points. Look, for instance, at paragraph 8:—"If the employer, after having agreed to a design, and had the contract drawings prepared, should have material alterations made," there is to be an extra charge, unless the alterations were made in order to cut down the contract to the amount of the architect's estimate. Well and good; but why insert the words "after having had the contract drawings prepared"? An actual case will show how unfairly this proviso sometimes acts. Some 16 years ago, a large public building was erected in the north of London. The tower, which was an expensive one, remained incomplete for want of funds. After three or four years, the committee began to think about building it. Being in no hurry, they called for design after design, perspective after perspective. One year they had six or eight square towers of different types submitted. Another year they went in for polygonal ones. A year or two after they tried spires. Then somebody wanted a dome, and somebody else suggested a "crown," like that of St. Nicholas, Newcastle. But on three different occasions they did deliberately approve a design, and then, long afterwards, altered their minds, and wanted a different one. Every design submitted involved an estimate of cost, which, in such a subject, could not be arrived at by mere cubing. Every design, too, needed an approximate calculation of its weight to be made, though contract drawings were not asked for except in the final case. These performances went on, with occasional intermissions, for nine years. At last the work was done. The committee, like honourable men, expected to pay for the time occupied in this immense amount of preparatory labour. But one of their members was an architect, and had been an unsuccessful competitor for the building. He raked up the clause we have referred to in paragraph 8, and contended that nothing beyond the 5 per cent. commission could properly be claimed!

We might say something about the vagueness of paragraph 2, which describes how designs for fittings, stained glass, and decoration are *not* to be paid for, but omits to state how they are to be. Then, again, how much attendance has an architect to give in order to receive instructions? Must he, for instance, spend one, two, or three evenings per week at committee meetings for half, or even perhaps for all, the time in which his building is going on? This is sometimes expected of him; but is it reasonable? Then, again, what is "examining and passing the accounts" in cases where there is no quantity surveyor? Practically it means, very often, measuring up the variations; for how else can the architect certify the accounts to be correct? Other points such as these turn up in practice, and need discussion while the Institute Schedule is being revised. But the great and vital point, the point from which some substantial good might really come to everyone concerned, is the first one of which we spoke—the making of the architect's duties clearly and unmistakably separate from those of that respectable and useful personage, the building negotiant.

STATUTORY "NEW" BUILDINGS.

MANY doubts have arisen about the meaning of the term "new" building in the London Building Act, 1894. Definition (6) leaves the point somewhat obscure. It includes any building erected after the commencement of the Act; any building which has been taken down for more than one-half of its cubical extent and re-erected, or commenced to be re-erected, wholly or partially on the same site after the above date, or any space between walls and buildings which is roofed after such date. These definitions do not say whether any and what addition to an old building is to be called a "new" building; whether, for instance, the addition of another story or a new set of rooms constitute a "new building" under the Act. Nor do they very clearly apply to a building which was commenced before January 1, 1895, or is being carried out under a contract entered into before the passing of the Act (August 25th, 1894), nor to certain alterations to buildings. In fact, cases have arisen already under these heads which have given rise to legal proceedings. It may be useful to point out that one of the instruction letters issued by the London County Council to district surveyors states that this particular definition must be read in connection with sections 207—212. Now, according to section 207, a builder or owner cannot alter a building in such a way that it may "not conform" to the Act, unless he has consent of the Council. If we read this section aright, it will prevent any alteration being made to an old building which would make it contrary to any provision as to new buildings. It will be seen, therefore, especially when we look at section 209, that there will be a very limited number of alterations which can be made to a building without bringing it under the new Act—in fact, it practically includes every important alteration, such, for example, as a projection or raising any portion.

The next clause is more definite. Suppose a party or external wall of a house not in accordance with the new Act be taken down, or falls, or is burnt down to the extent of one-half its superficial area, the whole of the remaining part of the wall which is not in accord with the Act is to be taken down or rebuilt in accordance therewith. We will cite a particular decision of some importance in this connection, made by a magistrate. It was held that when a building upon one side of a party-wall had been pulled down to an extent which made its re-erection the erection of a "new" building under section 6, but the party-wall, although it was not in conformity with the Act, was pulled down to an extent less than one half of its superficial area, the party-wall might be reinstated in its former condition. Thus section 208 was strictly interpreted in this decision. We quote the section: "Unless in any case the Council otherwise allow, where a party-wall or external wall not in conformity with this Act has been taken down, burnt, or destroyed to the extent of one-half thereof (measured in super. feet), every remaining portion of the old wall not in conformity of this Act shall either be made to conform therewith, or be taken down before the rebuilding thereof."

Section 209 is most important. It refers to additions and alterations, and interprets more clearly section 207, which we have referred to. This section subjects additions and alterations to the buildings to the provisions of the Act. It says: "Every addition to, or alteration of, a building, and any other work made or done for any purpose in, to, or upon a building (except that of necessary repair not affecting the construction of any external or party-wall), shall, so far as regards such addition, or alteration, or other work, be subject to the provisions of this Act and of by-laws thereunder relating to new buildings." This clause is, as we have just said, far-reaching in its effect, and will only exclude buildings that are exempted specially under the Act. Mere repairs are also excluded, as, for instance, taking out an old doorframe in an external wall and substituting a new one, provided the doorway is not enlarged; or decayed brickwork may be reinstated. But any alteration or addition, such as an enlargement of a room or raising a story, or the increasing the size of openings, comes under the new provisions. Buildings erected before the commencement of the Act, subject to the provision as to new buildings just considered, are free from interference. The next clause deals with several kinds of conversion of buildings, such as that of converting into or use of as a dwelling any building not originally constructed for human habitation; the conversion into one dwelling of two or more dwellings constructed originally as separate dwelling houses; the conversion into or use of two or more dwellings of any building constructed originally as one; the converting a building originally exempt from the building law into one which would have come within the enactment; the reconverting into dwellings of buildings which have been discontinued as such; the converting of shops into dwelling-rooms, or *vice versâ*—all which conversions are disallowed without the Council's consent. Then there is, lastly, a clause to provide for buildings in progress at the commencement of the Act, and which exempts from the operation of the new law any building in progress at the time, or which is to be carried out under any contract made before the passing of the Act, subject to the provisions of the previous Acts. One important point has been raised as to contracts made before the Act, which the L.C.C. have in their instructional letter made a note of. The committee say, they are advised that a distinction has to be drawn between a "building contract" and a "building agreement," the latter being merely an agreement between a ground landlord and an intending lessee to take certain land, and to build within a certain time. It will thus be seen that the statutory definition of what constitutes a "new" building (Sec. 6) is far from being complete, and must be read in connection with the other sections of the Act we have noticed. This is not quite as it should be, and the definition as it stands merely describes buildings erected after the commencement of the Act; any building taken down for more than half of its cubical extent and re-erected; and any space between walls which is roofed over after the Act commences. No mention is made of additions or alterations which comprise the majority of the cases which come within the definition. This definition draws a line at the commencement of the Act, a new building being one erected after that date. As there must be numerous instances of old buildings being added to or altered since the date of the new Act, the application of the definition is by no means clear, and needs amendment.

"ARCHITECTURAL ENGINEERING."

THE phrase which heads this article at first sight seems rather like a contradiction in terms, yet it is one that was used in an address to engineering students of the Rensselaer Polytechnic Institute, U.S.A. It will be asked, How can engineering be made architectural—the two arts are so dissimilar, and in many respects contradictory? How, for instance, can such works as railway tunnels, embankments, reservoirs, filter beds be rendered architectural? These and other similar constructions chiefly appeal to our sense of mechanical fitness and ingenious contrivance, and cannot be considered to be on the same platform as architecture at all. Of course, there are other constructions which come within the scope of the civil engineer which are architectural, such as bridges, railway stations, factory chimneys. These are branches of engineering which are really architecture, or so closely trench upon it that it is hard to draw a line that divides them. A bridge and a lighthouse are structures which appeal to our artistic sense; still they are designed by engineers. Who will declare, for instance, that the Tower Bridge and the Eiffel Tower are not within the domain of architecture? It is true they are both mechanical structures in which engineering science enters, and which have called forth some of the highest attainments of the engineer; but they both represent architectural structures, and are designed—externally, at least—in accordance with the principles of architecture. We will not go so far as to say they represent the best or highest forms of the art. The Tower Bridge is a steel structure or framework incased in a shell of masonry representing Late Gothic features, and, therefore, we cannot say that it is an honest piece of constructive architecture; but it appeals to everybody as an artistic structure. For the sake of argument, let us compare two such very opposite examples of engineering skill as those afforded by the Tower Bridge and the Forth Bridge. These structures may very appropriately represent engineering as architecture, and engineering as engineering. No one can call the great cantilever bridge over the Firth of Forth architectural, whatever it might have been made. As a gigantic example of unsophisticated engineering and mechanical skill, without any pretence to design, it is conspicuous. There is no disguise or attempt to misrepresent the hard mechanical forms of the truss, and, so far, all is honest and straightforward, and in this sense it is a work of iron architecture of the age, and one which critics like the late Mr. Fergusson would delight to call a truer example of historical architecture than many a great architect's work—like the Law Courts. Or, let us compare two other examples of modern engineering construction, the Eiffel Tower, Paris, and the Great Wheel at Earl's Court, both of them designed as exhibition attractions, and as feats of skill. The former structure presents a claim to be considered a work of architectural design in iron; it has an elegant and well-equilibrated contour, and the designer evidently intended to impart to the work the graces of art; but the great rival attraction, or monster mechanical "whirligig," as it may be called, lays no claim to architecture, and we can hardly conceive how such a huge rotary machine can be made to look like a stable erection, to say nothing about art. Between these two kinds of construction a line can be drawn. On one side we have structures that may be regarded as architectural, and be designed upon principles common to all artistic production; on the other side we have constructions which have nothing in common with architecture. All machines which subserve essentially utilitarian purposes are of this latter class, as well as all civil engineering works, like sewerage works, railway tunnels, docks, marine construction, and the like. We can hardly imagine that any of these works can be rendered architectural—presentable to the eye certainly they may be made, and can be, if only a little thought and artistic sense could be infused into them. Thus, for instance, a factory, or a factory chimney, need not be positively repulsive. A few courses of brick, dividing the shaft into something like stages, or a top capping, or a slight alteration of a line or angle of roof may make all the difference between an ugly and an agreeable-looking building. Such things as filter-beds, or reservoirs, or sewerage tanks can be arranged in plan without becoming offensive; the angles of tanks may be rounded instead of made square, and we do not see why a geometrical arrangement—ornamental setting-out of plan—may not often be adopted with equal advantage instead of the everlasting rectangles and crude arrangements of the engineer. By these and other ways, even such engineering constructions might appear at least inoffensive to our taste. Our great water companies have made some places hideous by the huge and ungainly erections of their pumping stations and reservoirs. It is true here and there we see a company who have not disdained to employ an architect to design their costly buildings, as the Lambeth Water Company; or the engineer of the company has not thought it beneath his dignified position to make his chimney-shafts represent Italian campanili, nor to adorn his buildings with dressings and features borrowed from Renaissance and Gothic design, though they are often grossly misplaced or burlesqued. Still, those efforts show that engineers are not all blind or callous to architectural impressions when they have to deal with buildings of however utilitarian a character. It is in such cases as these that "architectural engineering" can come in or find a place. There is evidently plenty of scope for it in water-works. May there not be in our great gas-works? What hideous blots these are in our landscapes! Can nothing be done to mitigate or redeem the monstrous erections for storing gas which everywhere in our denser neighbourhoods mar the surroundings? The huge gasholders at Battersea, Kennington, Old Kent-road cannot be called "things of beauty"; but surely something even here can be done to mitigate their harsh outlines. Yet any attempt to make them ornamental would be simply ridiculous. The electric-lighting stations afford an opportunity to engineers if they cared to take the hint.

But there are other classes of structures generally intrusted to the engineer which appeal more strongly to our sense of architectural propriety. These are our bridges, viaducts, and railway stations. They come well within the line of architectural buildings. As yet engineers have done very little to take them out of the groove of commonplace construction. With the exceptions of London Bridge and Waterloo Bridge, which are masonry structures, and the iron bridges of Westminster, Blackfriars, Chelsea, and the new Tower Bridge, we cannot boast of very much. Where the architect has been consulted he has made things worse by adding ornament, in the way of cast-iron rosettes and other embellishments; the constructional lines and general features have all been designed by the engineer. In this branch architectural engineering may accomplish something. The viaducts which traverse our towns and cross our streets are generally unredeeming structures, sometimes hideous. Why the open arches cannot be made a little more architectural, and, if possible, let out as shops, is a question which deserves attention. A little more trouble in designing the brickwork and proportioning the arches, where the viaduct crosses a street, would scarcely add much to the cost. Let us next take the railway station. How very few of those can be said to be architectural! As specimens of "architectural engineering" we may mention the station at York, the Caledonian Terminus, at Glasgow; the St. Pancras Terminus, London—important buildings in which the combined skill of the engineer and architect has been displayed; but as architectural achievements they leave much to be desired, however good they may be as examples of engineering construction. The St. Pancras Station roof has been regarded as one of the latest attempts to impart an architectural form to the iron roof; yet it is rather as an engineering triumph that we must regard it. The Great Eastern Terminus roof is an advance in architectural construction, and certainly these examples, so marked as improvements on the common shed truss type of building, lead us to hope for a more satisfactory development. Lately the Institute gave prizes for a design for a railway-station, and the response showed that it was possible at least to design a railway-station architecturally, and to impart a freshness in the arrangement of the booking offices and other requirements. That the engineer has not been able to devote some portion of his earlier training to architectural design is partly owing to the multifarious requirements of his profession, partly to his inaptitude for artistic work. His work, too, is generally of a hurried and too mechanical a kind to admit of much thought in design or details, and these matters are generally left to the draughtsman. The large and important works of the engineer which assume an architectural character bear too distinctly the traces of separation between the professions of engineering and architecture to be mistaken. The construction and arrangements are left entirely to the engineer, and the architect's share is confined merely to the embellishment, and this separate treatment is prejudicial to artistic unity. Even the large pile of offices constructed mainly of girders and the American "sky-scraper" partake more of the engineering than the architectural elements, and such buildings may be correctly designated as engineering disguised, so little is the true architectural feeling manifested in the design.

THE CITY AND THE ENGINEER.*

THE thing and person named in my subject are inseparably correlated. If there were no cities there would be no engineers, for there would be no need of any; and if no engineers were to be found cities could not be built. You will see that I here use the terms in a broad sense—the city as the place of abode and work of human beings in considerable numbers; the engineer as he who moulds and puts to use the materials and forces furnished by nature. This last definition is too broad if we think only of professional work; but I will let it stand with the reservation that I do not refer, in what I may have to say in this discourse, to the part borne by the merely skilled workman. Speaking to young men, it is appropriate that the topic and its treatment should be of the nature of a forward look rather than backward, for it is more profitable for you to have hints as to the character of the responsibilities you need to fit yourself for, rather than tell you of what those who have gone before you have done—deeds which you will never be called on to repeat. None of those who have wrought in the field of city engineering has achieved undying fame. We do not know who was city engineer of Babylon in the days of Nebuchadnezzar, nor of Rome in the days of its glory; but we do know that they were competent men, for things were done in their days that would tax the abilities of the best of modern engineers. We know, moreover, that engineers were not, even in remote times, all from the ranks of practical men in the sense that term is often used as in contrast to scientific. Archimedes was an engineer of technical education, who put his theoretical knowledge to practical use. King Solomon, with all his wisdom, was wise enough to send to Tyre for an architect-engineer, who studied out his plans before he began work so thoroughly that the hammer of the fitter was not heard about the building. When notable engineering achievements are mentioned our thoughts tend towards rivers and gorges bridged, mountains tunnelled, great lines of transportation brought into existence, railways and canals located and constructed. These certainly are grand undertakings, but they are not now, and in days to come will still less be, the occupation of the great body of those who follow the profession of the engineer. My object will be to set before you, as young men looking to engineering as your probable life work, the fact, as I regard it, that engineering in and for cities is an inviting field for you to look over and perhaps enter of set purpose to find there your work. I am aware that some regard a nomadic life for some years as a valuable part of a civil engineer's education, and I do not wish to gainsay any argument that has been advanced; but the nomadic feature has an undue attraction to many young men, and, in my judgment, so far as roughing it enters into the life, it brings nothing of value. A young man will be the better for a broad experience gained by serving under many chiefs and adverse lines of work, so as to become familiar with a variety of methods before forming fixed notions and habits, and also to shake off any tendency to follow in the steps of a master;

---

* A paper by Robert E. McMath, M.Am.Soc.C.E., President of the Board of Public Improvements, St. Louis, Mo. Reprinted from the *Transactions* of the Association of Civil Engineers of Cornell University.

and further, if you will excuse me, to get some of the conceit taken out of him. Beyond this I know of no reason why he should not locate permanently at an early date. In my opinion, he will, as a rule, be the gainer if he selects his place of abode and never changes his residence, going from it as occasion offers, but returning to it. "A rolling stone," by the proverb, "gathers no moss." An engineer should not gather moss on his back; neither should he wear himself out by rolling. There is a happy mean that is worth seeking. I will fail of my object if you think my suggestions have sole or even principal reference to official positions. Cities furnish many opportunities for municipal engineering outside of direct employment by the city, and so far as my observation goes, when a chief is to be appointed the fortunate party is usually one who has wrought in these outside lines rather than one taken from the ranks already in city employ. Under a well-administered civil-service system this might not be the case. To forecast the future of municipal engineering we must first ascertain what the cities of coming days are to be. There is a proper use of the imagination, which is essential to success. One must first conceive the idea, then picture in his mind the object in outline, and afterwards perfect the conception by working it out in appropriate details. In my own life I have gone through some preliminary stages, and have dismissed as too visionary for serious consideration projects which I have seen conceived, taken up, and successfully carried out by others, who had more faith in their imagination than I, or better judgment. Poets have sung of the excellencies of pastoral life, and spoken disparagingly of cities. "God made the country, and man made the city," says Cowper, and in the same strain Cowley voices the reproach, "God the first garden made, and the first city, Cain." I am not aware that these writers gave evidence that they ever read the Good Book through, or they would have at least qualified their implied condemnation of the city, for He who at first put man into a garden to meet and yield to temptation, in the end intends that perfected man shall have his permanent home in a city. A study of the specifications of that city shows that it is to be beautifully adorned, perfect in sanitary arrangements, well paved, and the pavements kept clean, without slum districts or dark places, abundantly supplied with pure water, food so ample and secure in supply and distribution that none of the inhabitants can lack. We speak of cities as well built, and call some of our modern-style buildings "sky-scrapers." But Chicago or New York's tallest are but dwarfs compared with the lofty architecture that shall be characteristic of the final city, and the beauty of its buildings will appear from whatever point or angle viewed—not as ours, fair in front, but hideous from side, rear, or distant view. I have named the points in the specifications which pertain to engineering, and would impress you with the thought that municipal engineering has a future, without limit in time and scarcely in scope. The chief engineer has dropped a few hints as to the ultimate plan, and has left to us—his assistants—the privilege of filling in the outlines and working out the details. It is as much a privilege and honour to lay foundations as to gild finials. Coming to the realm of present facts, as demonstrated by the actions of men, man is made for life in communities, and the community becomes by natural development a city. Cities have been a chief factor in civilisation, "redemption from savagery." Cities furnish the opportunity for men to make the further progressive step to enlightenment, coming under the protected law of liberty, by which each man's free acts will not infringe upon the right of any other. Perfect enlightenment is the realisation of an ideal social state to which close and necessary association is an essential condition. The city has throughout the history of the race been the centre of activities, the initial point of action. In the centuries preceding the 19th the size of the cities was limited by ability to command supplies; a maritime location alone enabled a great city to be fed. Steam and the railway have in a great measure done away with the limitation. Men may now gather to any number anywhere that water in sufficient quantity can be had, and bear in mind that the quantity of this necessity per capita increases with progress in civilisation. Moreover, density of population finds a limit in sanitary conditions. With steam, railways, electricity, telegraph, and telephone have come improved implements and machinery in all lines of industry whereby the labour of one man in field or factory accomplishes what formerly required a dozen. Hence the production of food is no longer the necessary avocation of a majority of men, and labourers are made free or even compelled to find other employment than agriculture. Machinery has also rendered the continuance of many home industries impossible, and the manufactory has displaced small shops. These changes are the result of development and have come to stay, and men are and will increasingly be compelled to congregate in large masses in order to win a living. The growth of cities in the old world and new alike has been astonishing for the century now drawing to an end, and especially for the last half of it. Even in states whose history scarce covers 50 years the country parts and small towns are actually decreasing in population, while the growth of cities and large towns on the way to become cities show a high rate of increase. So far from being disturbed by the facts and bemoaning their existence as indicative of evil, we must recognise, if not welcome, them, and prepare to meet the coming situation. Such preparation, in the first instance, calls for a high degree of practical, large-minded wisdom on the part of those whose province it is to legislate concerning municipal affairs and to administer them, and, I may add, on the part of courts when interpreting law, for new conditions will require the modification of many positions taken by courts in restraint of powers needed for great cities. It might be interesting to inquire why this drift of population to cities has developed and progressed so rapidly; but our time and my purpose do not permit going into detail or proofs. I content myself with stating these propositions:—(1) The movement is in accord with the social instincts of the people of the latter part of the 19th century, and is a result of universal education and the printing press. (2) External conditions now permit these great aggregations as not inconsistent with necessities, comforts, and conveniences of life. (3) External conditions not only permit but exert a certain amount of compulsion for many to leave the country and seek the city. These external conditions are largely the result of inventions and discoveries in the useful arts and sciences. These impelling forces drive those who have a living or fortune to make or mar citywards, regardless of the probable outcome of good or evil. In my opinion, the whole balance of probability is in favour of good as a whole, notwithstanding the fact that it is easier to slide down than to climb up, in a moral sense, as well as in a material. But I acknowledge that, unless wisely-directed effort is put forth to provide the city populations with healthful influences, there is much of danger to country and race from the movement of the masses towards cities. An economical theory that is much urged in these days charges that a large part of the ills affecting the masses is due to the individual ownership of land, claiming that poverty exists and increases because the masses are shut out from using the soil with the freedom that they have to light and air. To set aside these theories as untrue in essence and impracticable of application, it is enough that, as a fact, it is not possible to drive the average city-bred poor man to the soil; and further, that he would starve in hopeless impotency to get anything from the soil if placed upon it without preparation and capital. If he could realise the delusion of the newly enfranchised negro of post-bellum days, that with freedom he was to have "forty acres and a mule," he would be likely to desert the acres and make the mule carry him back to town, despite the familiar privations he must there undergo. "Better fifty years of Europe than a cycle of Cathay" expresses a psychological principle deeply rooted in human lives. To my notion, it is not access to the soil for cultivation that the masses need, but they want a place to live in and a home. Better if each can own land, house, and all that goes to make home comfortable and attractive. Well, if each can have a separate house with grounds for children to exercise and play in without resort to the streets and their mixed associations. It is endurable if each family can have rooms and separate privileges, such as are afforded by the better class of apartment-house or flats; but we can go no lower in the scale of home conditions, and reasonably hope that parents and children will climb rather than slide down. My idea of a city of individual homes involves a liberal appropriation of land, and therefore a spreading over large areas and large expenditure of public or private means to realise the idea. A metropolitan city may embrace a number of semi-detached suburbs. The engineering part of the great problem of salutary municipal homes is to provide all the conveniences at or near the home, at such cost, so that the working man of average earning capacity can have the use of them as owner or lessee; and further, to provide ways by which the multitudes can be quickly and cheaply carried from home to working places. The alternative is set before us to rear good citizens in pleasant, salutary homes, with opportunities for mental and moral education, or to breed anarchists, thieves, drunkards, prostitutes, and paupers in tenements and slums. If we will shut out from view the slums of the old part of the cities, Greater London and New York may be cited as partial foreshadowings of what metropolitan cities may be. We see:—(1) A central business heart, crowded even to jostling during the day, but silent and well-nigh deserted at night and on holidays. The toilers resting or recreating miles away from the scene of their toil. This heart is the commercial and financial centre, which cannot be spread out, but must be condensed in space to a degree that would be intolerable if the hours of work were long. (2) In suitable localities, more or less remote from the business heart, we find industrial centres, and of late years these tend to be confined to a narrow belt along railway lines, so that each establishment may have direct shipping facilities. (3) Residential districts of several grades. It is desirable that the industrial centres should embrace a variety of works or of departments calling for many classes of labour, in order that all the working members of the family may find employment suited to their age, strength, and sex, within a reasonable distance of the home. The working people of such a centre can find ample space for separate homes within a half-hour's ride by electric cars—say three to four miles; employers and short-hour workers can afford the ride farther. These industrial centres and resident districts may be semi-detached in locations; but should be so associated in name and government as to subject transportation rates and terminal charges to equitable control. I have named the two cities—Greater London and New York—as shadows, not examples, in order to forestall the thought that I am suggesting a visionary project, and I claim that practicability is proven by what has already been done. The suggestion is not mine, but it is made by the progress already achieved towards the condition I am endeavouring to set before you. You may see for yourselves the densely-crowded business centres, where floor space within the favoured area is so valued as to have brought into being many-storied office buildings, in which buying and selling and financial transactions take place out of sight of the commodities dealt in. The warehouses and manufactories are now placed along and near railways, for a switch is a cardinal necessity to a successful business. The small shop on a back street, receiving material and sending out product by dray and waggon, is passing away. Building associations and the real estate speculators have joined forces with the street railway to make it possible for the artisan to gain a home in full or prospective ownership at but a little more expense than renting amid squalid surroundings. These and other forces are working, and the work has far progressed already. Our cities, in their rapid expansions, are working at the problem in an unconscious, unintelligent, and therefore imperfect, way. What should be done to render progress in city expansion intelligent and adapted to coming conditions? (1) Upon the part of civic publicists there should be a careful study of the principles of municipal organisation and a determination of the form of city government best adapted to American cities. Shall the government be essentially aristocratic? That is, have its executive powers virtually in the hands of one man—the mayor—giving him the power to appoint and remove at pleasure any and all subordinate officers and employees? There are many and strong advocates of this plan of concentrated responsibility. Contrasted with it is that of making the mayor little more than chairman of an executive committee—the council. Under this plan, as territory and interests increase, executive functions are subdivided and assigned to committees of council. This plan of government by committee seems to have worked well in the towns of England and Scotland. A third plan is to commit many important functions to boards, more or less independent of mayor and council, they often being the creatures of State authority. A fourth plan is a composite of the best features of the three, giving broad powers to mayor, limiting powers to legislative acts, giving to heads of departments a definite term of several years, and grouping them for consultation and initiation of projects. A chief reason why the first is urged is drawn from the bitter experience of several of the largest of American cities, in which the outcome of election of councilmen by wards has been to fill those bodies with corrupt, or what is equally bad, with incapable men. Combines, organised and controlled by unscrupulous bosses have their own way, and the objects of municipal government are prevented. If there be any remedy for these evils in investing the mayor with autocratic powers and holding him responsible, it must be that it is due to the fact that the mayor is elected by the voters of the city at large. Precisely the same may be said of a council elected in the same way. The second system works well abroad, for special reasons which do not exist in America, and cannot so long as we retain our present form of government. Elective positions are so few in number on the other side that to be chosen to one is esteemed a high honour, though the emoluments be small or nothing; consequently the best men in the community are ready to take office and serve faithfully. Again, a stricter enforcement of law and a cleaner administration of justice serve to keep corrupt men out of office, or if such get in, to restrain them by salutary fear of consequences. With us the multitude of elective offices has cheapened them in general estimation to such an extent that candidacy for place in municipal legislative bodies exposes the candidate to suspicion of crooked intent. Especially is this the case if election is by wards. Some attribute a large share of the evils in city government to interference with elections for city officers by the organisations of national political parties. Of course, it is absurd to suppose that a man's views as to protection, free trade, or tariff for revenue have anything to do with his fitness to pass on matters of purely local interest, but there is a decided advantage to be derived from the division of voters upon some line into two nearly equal bodies, for then the independent voters may have hope to hold the balance of power, and it is the independent voter who chooses men for what he at least believes them to be. To the independent voter we must look for restraint of evil and furtherance of good. For American cities I favour a mayor vested with executive powers, a legislative body in two parts—one elected at large at somewhat infrequent intervals, the other elected by the voters of districts composed of two or three wards, on a combined ticket; executive department heads to be appointed by the mayor, with approval of council, but providing ample power of removal for cause, and restriction against removal without cause; in the departments a qualified civil service, elastic enough to cast out incompetence, and rigid enough to hold against changes for personal or political reasons.

(*To be continued.*)

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—III.

By Joseph Horner.

In my last article I mentioned the three ways in which the quality of cast-iron work is estimated—namely, by inspection of fractured surfaces, by means of test-bars, and by breaking up a small percentage of the castings selected at random. Of the first method I shall say no more, as being incapable of application except in the hands of any but an experienced foundryman. Of the other two, for the applications of which less technical experience is necessary, a good deal can be said with advantage. The method of breaking up a small percentage of actual castings, though it reveals a good many things which a test-bar does not tell, should be made use of in conjunction with the employment of test-bars. These bars tell the strength and elasticity of the metal in a way that every one can read, and with a precision that can be obtained in no other way. We will, therefore, consider first the method of testing by means of the fracture and deflection of bars.

Test-bars are not so reliable and valuable as indications of the quality of cast iron as strips from plates are of wrought iron and steel. That is not the fault of the bars, but is accounted for by the uncertainty of the material. A test-strip shorn from a plate will generally indicate the quality of the plate accurately. But a plain test-bar and a casting are very different specimens. The first is of uniform section, the second is of dissimilar proportions; the first has no cores, the second generally has; the first cools uniformly, the second irregularly; the first is subject to regular and uniform stress, the second to stresses of a mixed character, and so on. As an engineer, therefore, though I should note the breaking strength, and deflection, and aspect of fracture of a test-bar, I should also practically judge the casting itself by its general appearances. Cast iron is so uncertain a material, that even the bars which are cast under the most favourable conditions in regard to uniformity of section and equal rate of cooling vary in strength at the testing machine to the amount of 10, 15, or 20 per cent. So that the practice is to test several bars, and take the average results. Again, small bars are stronger than larger ones, though poured from the same metal, just as small castings are stronger than large ones, though made from the same metal.

But the mere statement of the strength of a material does not tell an engineer all which he wants to know in order that he may be able to form a correct judgment as to the suitability of that material for a given purpose. The term "strength," as commonly understood, relates only to the capacity for withstanding stresses tending either to rupture by tearing apart, or to rupture by compression, or to rupture by the operation of stresses of a mixed character. But it is equally necessary that the behaviour of the material should be known *before* actual rupture takes place. It is necessary to know the measure of its ductility or capacity for extension, of its elasticity or power of regaining its original form on the relief of stress, and also of the stage at which perfect elasticity is lost—the "yield-point" at which a permanent set occurs.

Now, cast iron, unlike wrought iron and mild steel, has no elastic limit—that is, it has no point up to which the stresses and strains are proportionate, and up to which there is no permanent set. It begins to take permanent set with comparatively small loads, and gives little warning, practically none, before fracture. Such being the case, it is highly necessary that the actual loads which produce ruptures under different kinds of stresses should be accurately known, and also that full advantage should be taken of such slight elasticity as is obtainable in certain grades of iron, likewise the way in which failure occurs should be fully understood.

Columns, stanchions, and girders all have to sustain strains of a bending character—that is, strains which combine tensile with crushing. Sometimes these strains are caused by dead, or statical, loading; sometimes they are produced by live, or suddenly applied, variable loads. A structure frequently has to sustain both kinds of loading at different times. The nature of the loads which any structure has to sustain should, therefore, be taken account of in proportioning the various members of that structure, and in making tests of the materials used.

Cast iron is tested for simple tension by tearing a bar of some definite section apart in a machine in a direction coincident with the longitudinal axis of the prepared specimen. It is tested for compression by exerting pressure on cubes, the height of which does not exceed by more than from two to three times their transverse dimensions, the specimen usually shearing off at an angle of about 56° with the axis. It is tested for cross bending, in which the forces of tension and of compression both come into play, by means of long test-bars of rectangular form, which are miniature beams supported at each end and loaded at the middle.

The ultimate tensile strength of average cast iron cannot be safely taken higher than from 7 tons to 9 tons per square inch. It is not necessary to give statements as to the various results obtained by experimenters, who have obtained anything between about 4 tons and 20 tons. It would be unwise to calculate on more than from 7 to 9. Mr. Barker once stated that in testing more than 1,000 samples of cast iron for tensile strength he obtained an average ultimate strength of over 12 tons per square inch. That looks well, on paper,—just as a test-bar of 32cwt. strength looks well. But every practical man knows that such figures are very delusive, because in fact the ultimate strength of a casting is measured by that of its weaker portions, and that depends on the designer and the moulder. I have known plenty of castings break in the sand during the cooling, have known them break on a frosty morning, going off with a loud report, have even known them break while being tooled. Mr. Barker says that in the course of testing he has seen specimens break more than 80 per cent. below the average of such samples, specimens to all appearance identical with the best in outside appearance, and that he has seen specimens break at 40 per cent. less stress than the average, without anything to denote the difference to an inexperienced eye in the fractured surface.

Because, therefore, of the uncertainty which attends the production of castings, it is seldom judicious to allow cast iron to be stressed in tension to more than one-sixth of its breaking strength, and then only after the most careful scrutiny has satisfied the inspector that the parts subject to tension are perfectly sound. Taking the ultimate strength at 9 tons, which is, I am sure, rather above the average, that will give $1\frac{1}{2}$ tons as a safe working tensile strength, and this may be set down as a constant rule.

Purely tensile tests are very suitable for average work, because they test the iron under the most unfavourable conditions, which, however, not unfrequently occur in practice. Cast iron is weakest in tension, and, therefore, it should be tested in tension. When tested transversely, as in the common test-bar, laid horizontally, and loaded at the centre as a girder, then the upper edge is in compression, and the lower only in tension, and stresses are of a mixed character. If the iron happens to be strong and hard, it will show higher results than a greyer, softer iron, notwithstanding that the latter would be more suitable for work in which elasticity is necessary.

Experiments have shown that the tensile and cross-bending strengths of cast iron do not coincide. That is, a bar having a higher tensile strength than another bar will not necessarily show a corresponding higher cross-breaking strength, but probably a lower one. Formulæ have been constructed for the conversion of one kind of stress into terms of the other. But they are only suitable for the experiments on which they are based, and for one class of iron. It is better not to use them, but to resort to direct experiment under new conditions.

Cast iron is enormously strong in simple compression. The average crushing strength ranges between about 35 to 40, or 42 tons. But the specimens must not exceed by more than two or three times the transverse dimensions, or the mode of fracture partakes partly of cross-breaking. The shearing strength is about equal to the tensile strength. But this is of little practical importance.

Test-bars for cross-bending have been made of nearly all conceivable size, from 1ft. long to 7ft. long, and of varying sections. The most common size is 3ft. long (always reckoning between knife-edge supports, the bar itself being 3in. or 4in. longer), by 2in. deep by 1in. wide. This is most often used, and weighs 21lb. Other common dimensions are 3ft. long by 1in. by 1in., and 1ft. long by 1in. by 1in., and 1ft. by ½in. by ½in. But although the size of a bar influences its strength, that is a matter of slight importance by comparison with the large margin of safety allowed in cast-iron work. In each case, the strength of the bar is calculated as that of a beam supported at both ends, and loaded at the centre. The usual formula for these is—

$$W = \frac{BD^2}{L} \qquad (1)$$

In which—

W = the breaking load in tons.
B = the breadth of the beam in inches.
D = the depth of the beam in inches.
L = the distance between the supports in feet.

If we take a bar 3ft. by 2in. by 1in., then by the formula (1)—

$$\frac{1 \times 4}{3} = 1{\cdot}33 \text{ tons.}$$

If we take a bar 1ft. by 1in. by 1in., then—

$$\frac{1 \times 1}{1} = 1 \text{ ton.}$$

Test-bars are often made of 3ft. span by 1in. by 1in. Such bars break at about one-fourth the load necessary to break bars of 3ft. by 2in. by 1in., because the strength of a beam varies as the square of the depth, and the square of 2 is 4. But they often show a slightly higher strength, and this is doubtless due to the closer texture of the grain. Such bars will deflect about $\frac{5}{8}$in. before fracture, or not quite twice that of the 2in. by 1in. bars. The rules give quite the minimum of strength demanded. Generally test-bars give better results than these. Of late years the requirements of engineers and inspectors have raised the quality of iron subject to test, and founders have had to be more careful in selecting and mixing for inspected work. Years ago 25cwt. was a common limit of breaking strength for a 2in. by 1in. bar. Now it is usually about, or even over, 30cwt.

When a test-bar breaks, it breaks so clean that the ends will always fit close together again. The act of rupture, therefore, does not detach any particles from the surface. It occurs, roughly, at right angles with the length of the bars. In the very strongest and best grey and mottled irons, however, the aspect of the fractured surface differs from that of ordinary grey iron, and from white iron. The fracture is not quite short, but rather rugged, and often small fragments of iron are left partly fractured, partly adherent to the broken surfaces, giving them a flaky appearance. This indicates the toughest and most elastic quality of cast iron procurable, and scrap of this character is reserved for the best class of castings.

Although the majority of bars break straight across at about the centre, many yield a curved line of fracture away from the centre, indicating that one section of the bar is weaker than the other. In Mr. Millar's exhaustive experiments on test bars, it was proved that the popular idea that bars which break with a curved fracture denote stronger iron than those which break straight across, is an erroneous one. It was, however, clearly demonstrated that bars which break at the centre, or within about $\frac{1}{2}$in. of the centre, invariably fracture straight across, while those which fracture at positions away from the centre always show a partially curved fracture, and that the form of curve varies with the distance from the centre of span, and that the curve of fracture always extends towards the centre of the bar, never away from it. Fig. 1 illustrates the forms of these curves obtained in Mr. Millar's experiments, *c* indicating the centre of the bar. The fractures Nos. 1, 2, 3, 4, 5, 6 occurred at the following distances respectively from the centre—$\frac{3}{8}$in., $\frac{3}{4}$in., $1\frac{1}{2}$in., $1\frac{7}{8}$in., 2in., $3\frac{1}{4}$in., the amount of curvature increasing with the distance from the centre. It will be noted that the curves increase in extent as the line of fracture recedes from the centre. Also that the actual curve occurs at the lower portion of the bar which is subject to tension, and ceases at the narrow upper zone, which is subject to compression, becoming then a short vertical line running in unison with the direction of the load. This is very suggestive, emphasising the fact that cast iron, run not only from the same ladle, but also in the same bar, varies much in strength, and since the fractures on the compression side are always nearer to the centre than those on the tension side, it seems to bear out the fact that cast iron is more reliable and regular in its behaviour in compression than in tension.

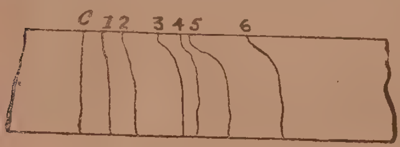

Fig. 1.

If cast-iron bars will show, as they do, differences amounting to from 10 to 20 per cent. when run from same ladle, such percentage variations may be well doubled in the case of irregularly proportioned castings, subject to many conditions of design and workmanship which tend to irregular results.

I must reserve the consideration of the differences in the behaviour of cast iron in tension and in compression, as illustrated in the test bars, for the next article.

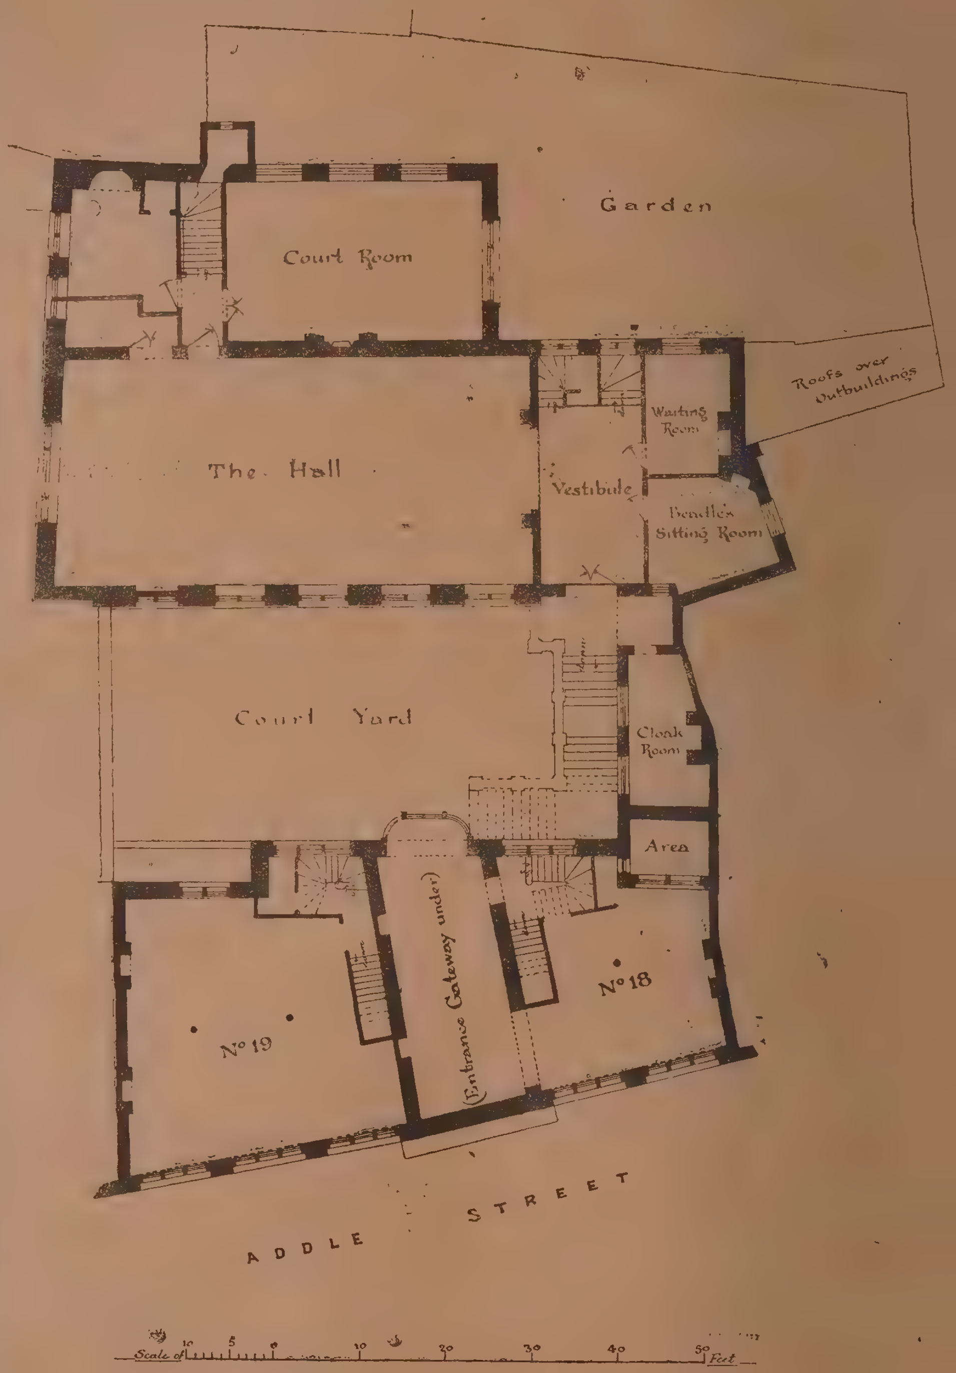
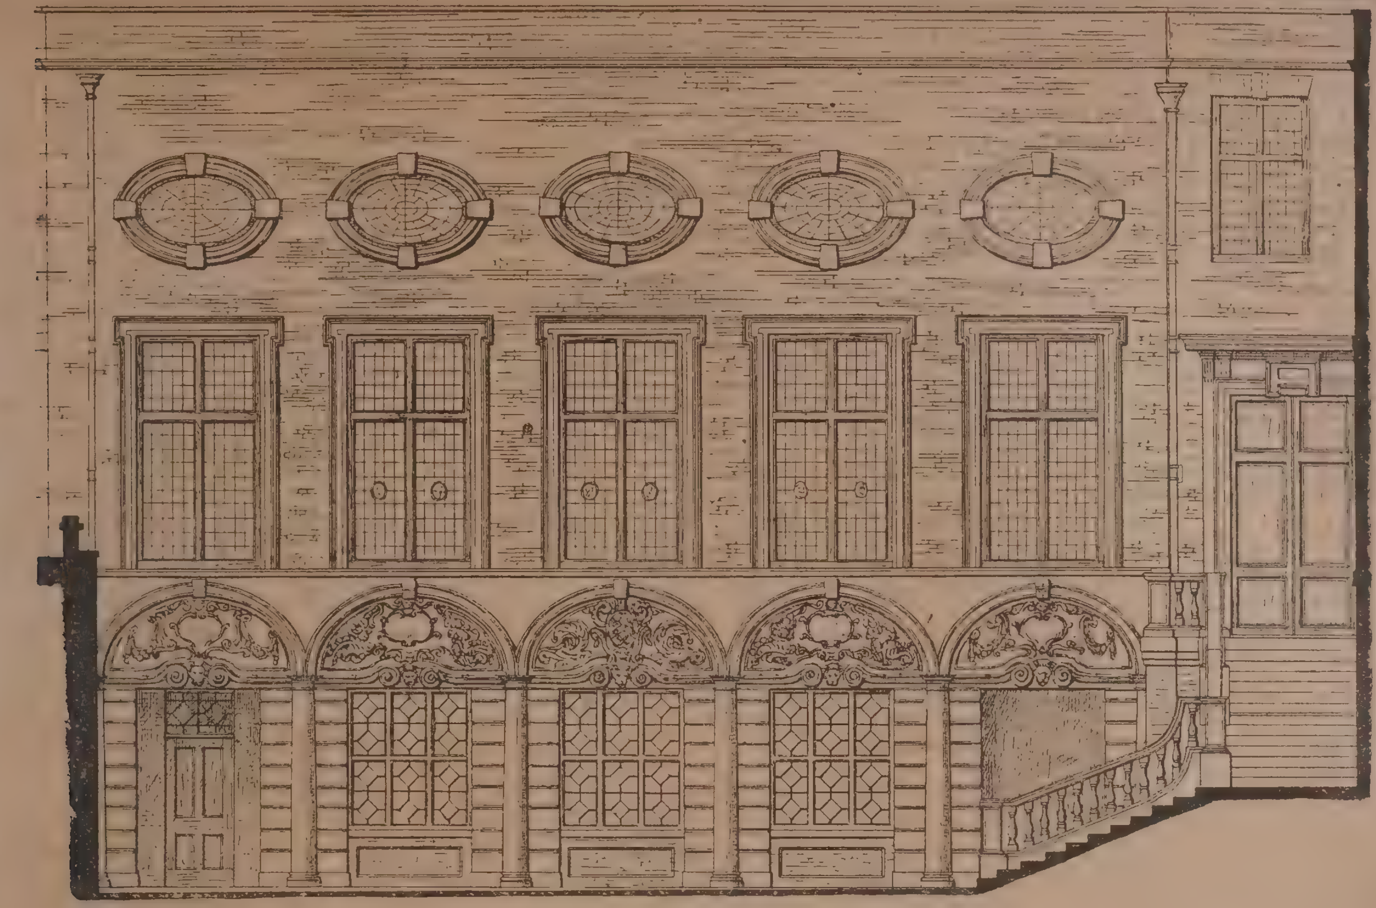
BREWERS HALL.

PLAN OF PREMISES AT FIRST FLOOR LEVEL



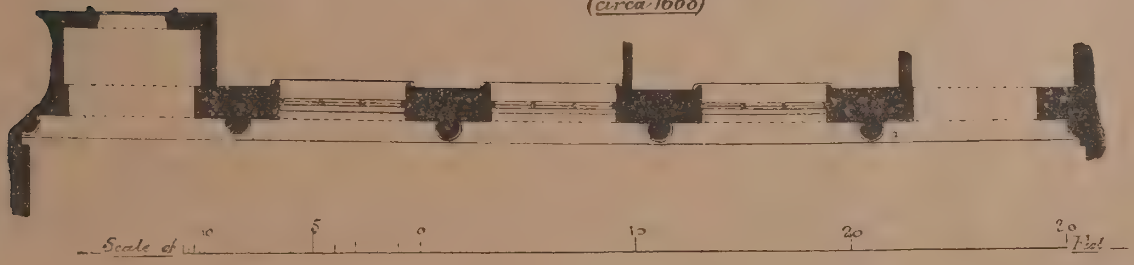
AMBIGUITIES IN THE NEW LONDON BUILDING ACT, 1894.

A CONTRIBUTOR to the current issue of the *Journal of the Society of Architects*, who signs himself "M.S.A.," writes: "Architects are beginning to discover that the new London Building Act, 1894, contains a great many ambiguous sections and clauses, apparently the result of the great desire of the London County Council to conciliate the large amount of opposition arrayed against it, and to pass their Bill at any sacrifice. The rules as to recesses and openings in external walls on the ground story are very vague. By the insertion of the words 'above the ground story,' one does not know what amount of opening and recess to provide at the ground-floor level, especially where your building is only one story in height. The provision in Section 73, Clause 5, as to bay windows being permitted beyond the frontage line without preliminary application to the Council, is of somewhat doubtful advantage to architects, as they are only permitted to project 3ft., and must not come in any part nearer to the centre of the party-wall than their projection. This, in narrow frontages, very often throws the bay window to one side of the room, instead of it coming in the centre. Section 74 requires a deal of interpretation, and is very far from clear in its details. It has reference to buildings exceeding ten squares in area, and used partly for dwelling, and partly for purposes of trade. Does this apply only to new buildings, or does it apply to an addition to an old building, where the area of the old and new part, if added together, would exceed the ten squares, and are the regulations to be carried out only so far as they affect the new part, or to old and new parts alike; and if you have fire-resisting doors of oak or teak, can you have door-frames of the same material, and is it in the case of a fire-resisting floor, sufficient if you fill in concrete between the ordinary wood joists? What is the definition of a conversion of a private building into a public one under Section 79?—is it simply a question of user, or must some alteration be made? In Section 80 great attention seems to have been paid to the width of staircases, corridor, and passage ways; but the width



Elevation of Brewers Hall towards Court Yard

(circa 1668)



of door openings is not provided for, and although no outside locks or bolts are to be affixed thereto, it does not say what fastening you may have. In the schedule relating to the thickness of walls, a three-story building must have two stories of 14in. work. This may be all very well to living-rooms; but where you want to put a small addition in rear of a dwelling-house, perhaps consisting of a scullery below a garden entrance, or lobby on the next floor and a bathroom and w.c. above, the whole area of which is 10ft. by 8ft., it seems rather absurd to have to inclose two of these stories, each under 9ft. high, with a 14in. wall. It looks very much as if the New Building Act will have to be followed by an Amendment Act in the near future."

BREWERS' HALL.

IN connection with our "City Guilds" series, we have already given in the BUILDING NEWS views of the Court-room of the Brewers' Company, March 22nd last (when we gave detailed description of the Old Hall of the Brewers' Company in Addle-street), and the Screen in the Great Hall on April 26th last, both from photographs specially taken for us by Mr. J. T. Sandell, with his plates. On May 17th we illustrated some sketches of the quaint kitchen, and the barge table and masters' chair in the Court-room. We now, by the courtesy of Mr. E. H. Martineau, the architect of the new buildings in front, further illustrate these premises by an elevation towards the courtyard and a plan taken at the first-floor level.

COUNTY LUNATIC ASYLUMS.—XXVIII.

By GEORGE H. BIBBY, F.R.I.B.A.

CONVALESCENTS' RESIDENCES.

IN a large asylum where the average number of resident patients was 2,249, the number admitted during one year was 519, while 215 were cured, 80 were removed or relieved, and 232 died during that period.

In many instances, the patients, when discharged, are compelled to go direct to homes which contrast very unfavourably as regards locality, comfort (and inmates) with the institution from which they have been discharged; in some instances, the only "home" is the workhouse, from which they may have been sent by the board of guardians of the parish to which they become chargeable. Therefore, it would appear to be very desirable that there should be provided some buildings of moderate extent wherein the recovered patients could reside for a reasonable period prior to resuming the occupations and associations of their station in life. When a patient has been discharged from an institution, his reception order expires, and he is free to do as he pleases. It is rarely that *perfect* recoveries are made, and it is an ordinary course to grant patients, sufficiently improved, a leave of absence on trial, previous to a full and definite discharge, and the question as to whether or not the recovered or improved patient should be returned to a workhouse-ward, his former home, or to a convalescents' house, are matters upon which the asylum authorities would obviously be better able to form a sound opinion than the guardians of the patient's parish, or the friends of the patient.

The asylum architect may, therefore, have to plan buildings for the reception of a limited number of discharged patients, or patients granted leave of absence on trial, to be erected either upon some portion of the asylum estate, at the sea-side, or in some other suitable locality, this detached institution being under the control of a master and matron, and, though in touch with the asylum, yet so planned and constructed as to allow the discharged patients very considerable freedom, but under a certain amount of quiet observation.

The buildings for convalescent patients, even if in conection with a very large asylum, need not be very extensive, and assuming, as an instance, that the asylum authorities discharge 200 patients per annum as recovered, and that the residence of each discharged patient averages one month in duration, it will be perceived that the building for the convalescents' home need not provide accommodation for more than 20 patients, discharged or granted leave of absence. The erection should be in two divisions for males and females, with single bedrooms in each, and suitable bath and lavatory accommodation must be provided. There should be a small library and writing-room for the use of both sexes, and separate dining-rooms for each sex; also kitchen and other offices, with a small residence for the master and matron.

When the asylums are for the accommodation of limited numbers of patients, one of these convalescents' homes might be provided for the reception of discharged patients from two or more asylums: the great advantage of these homes would be the opportunity for the gradual introduction of the society of sane persons in place of the ordinary occupants of the main asylums, and in place of a possibly too sudden reintroduction to their former friends and associates, a close association with whom might, by reason of incompatibility of temper or other adverse circumstances, tend to cause the patient's return to the asylum in a worse condition than at first.

The buildings should be of a very simple and unpretending character. What is required is merely a temporary, but comfortable, home, without any of the adjuncts or suggestions of an asylum, where the discharged patients could reside for a limited time, while having in view the necessity of soon resuming all the duties and employments of the stations in life to which they belong, and perhaps endeavouring to obtain suitable employment, with a greater prospect of success than if directly transferred to their homes, if, indeed, they *have* any homes. The dismissal of patients chiefly depends upon the action of the medical superintendents. At first, it should, as a rule, be provisional or experimental; thus, on the first indications of a relapse, it will be easy to bring the patient back to the asylum. During this temporary dismissal, there should be occasional reports from those to whom he is sent as to the state of his health. Should the convalescence continue during a sufficient period, the patient may then, for the first time, be permitted to quit all connection with the asylum. There is obviously great necessity for aid by societies for needy convalescents; these exist, I believe, both here and abroad.

From the statistics of institutions for the insane, it appears that recent mental disease allows of a far better prognosis than most other chronic affections of the brain. If we understand, however, the word "recovered" to signify, as it ought, the total disappearance of the mental disease and the complete return of the former capacity of intellect—of the whole earlier force of character—it must, of course, be but seldom that such a result can be expected. Cases are numerous where, indeed, the leading symptoms of the insanity disappear; but the individual retains a slight feebleness of intellect, continues irritable in temper, or is possessed of certain eccentricities which, however, permit him to take part in the simpler avocations of life, and, it may be, to return to his former pursuits; therefore a distinction should be made in successfully treated cases between recovered and improved. Relapses are said to occur, by far most frequently, during the first and second years after recovery. A medical authority upon the subject states:—"This is easily accounted for by the state of exalted psychical irritability, which often continues for some time after the disappearance of the disease, and the greater susceptibility to physical ailments which must exist after so serious a malady. Too early dismissal from the asylum is likewise a frequent cause. To the first of these causes is also probably due the fact that relapses are somewhat more frequent in the female sex. It should be remembered also, too, how rare complete and lasting recoveries are in most chronic diseases, and how difficult it is to remove certain constitutional causes which may frequently have existed from earliest infancy, whose constant action has, as a consequence, a succession of diseases following the same pathological direction. It is not in the powerlessness of our art, nor to a certain predestinated incurability of these forms of disease, that we ascribe relapses in those who, on their dismissal from the asylum, return to the most deplorable conditions of life, or the full influence of those health-destroying causes which were to blame for their first attack: in the case of individuals who, on recovery, return to habits of drunkenness, to misery, to over-fatiguing employments, to the causes of violent agitations and emotions, we can almost with certainty predict a relapse; the drunkard especially is each time dismissed from the asylum only with the unsatisfactory prospect of soon seeing him again." Upon the whole, however, the prospects of recovery in insanity are much brighter than is frequently supposed by medical men and the public, and it is asserted that the prognosis in recent acute insanity is very much more favourable than in most other diseases of the brain.

The constructional arrangement and the fittings of the buildings to be appropriated to the use of recovered patients should partake, as far as may be found practicable, of the character somewhat of a boarding-house, and certainly not be suggestive in any way of their connection with the asylum with which they may be associated. At the same time the staircases should be constructed so as not to facilitate any attempts at suicide by any patient that may inadvertently have been released from the main asylum, and such other reasonable precautions of a kindred nature adopted with regard to fireplaces, and opportunities for concealment, &c., as may be necessary or convenient, having regard to the fact of the possibility of a relapse. The day and sleeping apartments should be sufficiently lofty and well lighted, and have rather the general appearance of private rooms, suitable for the occupation of persons taking a holiday prior to resuming their various trades or during the period of their efforts to obtain employment.

The following table shows the number of persons who have recovered or improved during one year in an asylum where there were 2,249 patients, also the probable causes of their insanity, and is of some value, having regard to the necessary arrangements for convalescents' residences. For instance, it will be noticed that 32 epileptics were admitted, and that ten of these were removed or relieved, and while only three patients recovered, on the other hand, mental anxiety sent 14 patients to the asylum, where 11 of them recovered. In this asylum a much larger number of female patients are accommodated than males, and the number of female recoveries is also greater.

It would not be necessary for the architect, in planning the residences for convalescents, to provide any arrangements for the classification of the recovered patients; the required buildings would only be of very moderate extent, and it may be supposed that if the patients have really recovered, that it would perhaps be even less necessary to provide for special separation in a convalescents' home than in the patients' own private residences, inasmuch as the latter are too frequently badly arranged and overcrowded.

The convalescents' home is not to be arranged by the architect as a building to be occupied by absolutely idle people, but as a place where the released patients could remain for a moderate period while making, with or without the assistance of their friends, their arrangements and plans for the future, and where their friends might visit them freely. The necessity or advisability of providing such a building cannot but be obvious if it be remembered that too frequently the only home of the recovered patient may have suffered during the insanity of the bread-winner, and perhaps even have been broken up for various causes during his absence in the asylum.

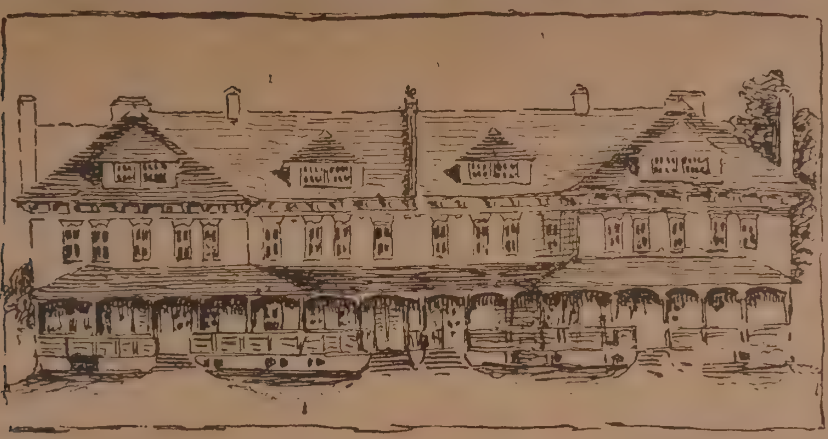
Under no circumstances, if it can possibly be avoided, should an asylum be erected within the precincts of a city; but if the asylum patients' convalescents' home be not upon the asylum estate (for economical reasons), there might be some advantage in having it near to a town, inasmuch as patients would have better opportunities of seeking for employment.

(*To be continued.*)

GLASGOW ARCHITECTURAL ASSOCIATION.

THE opening meeting of the winter session was held on Tuesday evening, in the new rooms, 187, Pitt-street. The premises, which are jointly tenanted with the Glasgow Institute of Architects, were occupied for the first time, and there was a large attendance of members and others interested. General satisfaction was expressed at the skilful manner in which the house has been adapted to the various requirements of the two societies. After the preliminary business had been transacted, the president, Mr. Alexander N. Paterson, M.A., delivered an address. The first part was devoted to a rapid survey of the work of the past session, particular reference being made to the progress of the schemes suggested by him in last year's presidential address. Whilst the projects for acquisition of improved premises and co-operation with the Glasgow Institute of Architects had been successfully accomplished, the third—increase of membership—had been to a certain extent delayed, pending arrangement of the first-named schemes. With the additional attractions the association now offered to the junior members of the profession, he anticipated a large increase, and commended improvement in this respect to the energies of the members. Referring to the memorials addressed to the responsible authorities relative to the Tron Steeple and Cathedral, Mr. Paterson said in so doing the association was fulfilling one of its functions in the promotion of architecture in this city, and indicated the action of the corporation in intrusting the designing of public buildings to a section of a department primarily concerned in works of a purely utilitarian character, as a matter demanding immediate attention. He further suggested the institution of a class of lay members—gentlemen neither connected professionally nor inferentially with architecture, but who were interested in it for its own sake.

The second part of the address was entitled "Archæology, History, and Art," between which, the lecturer continued, there existed an intimate relationship. The connecting link lay in the continuity, the traditional character of art, and particularly of architecture. To the architect who was ever seeking to assimilate and reproduce in his work the spirit of the old masters, even when endeavouring to solve the very different problems of the present day, the doctrine and practice of the ancients was of paramount importance. Proceeding to analyse and differentiate between archæology, history, and art, he said the first two were so closely interlinked that the one could scarcely be said to be complete without the other. Broadly speaking, however, the one was concerned with monuments, the other with events; the one with the actual details and arrangements of the buildings, the other with the significance of these as made clear by the habits and actions of the society of the time. Art was on an entirely different plan from the others, and for purposes of comparison with them it might be expressed in its widest sense as the creation of the beautiful. Considering architecture as an actual occupation, not as a theoretical study, the relationship between the terms of the title might be concisely put by saying that art, from the architect's point of view, was concerned with the design and erection of buildings in the present time, that the art in these buildings was a necessary and natural outcome and development of similar works in the past, and that archæology and history were the branches of knowledge by which we best arrive at a knowledge of such work. Architecture, from its close dependence on construction, was of all the arts that most closely ruled by tradition. It was scarcely possible to think of design apart from these symbols and formulæ that have come down from the past. The insistence on the traditional, the national, and even the local types, constituted at once one of the main interests and healthiest signs of a living architecture. The lecturer went on to



consider on the one hand how far the influence of archæology and history was beneficial and of real value in connection with everyday work, and on the other whether such influence was not by some allowed to preponderate to a hurtful extent, and even at times to lead to a confusion of identity between the means and the end. Accepting archæology as a scientific aid to study, and associating with it its necessary complement of history, it was difficult to imagine any subject more worthy the attention of the architect.

At the conclusion Mr. Paterson received a very hearty vote of thanks.

◆

AMERICAN BARRACKS.

A SURVEYOR of the Royal Engineer establishment sends us the following particulars of some new barracks being erected by the U.S. War Department at Presidio, California, with the hope that they may prove interesting to those of our readers who are engaged in barrack-building in this country. Our correspondent is indebted for the information to a professional friend in the States, who sent him a copy of an American paper containing a woodcut and description. He has traced the elevation from the woodcut, which was rather small and faint, but thinks that it will give some idea of the style of barrack buildings in vogue across the water. No plans were given in the copy of the paper; but the following extracts give leading particulars :—

"Seven double barracks will house 14 companies of infantry; over 20 durable brick houses will be erected for the officers' quarters.

"A description of one of the double barracks that has just been finished will apply to the other six remaining to be completed.

"The front elevation herewith gives an idea of the size of the structures. It contains two stories, with a basement and attic. The frontage is about 144ft., the depth 120ft., and the minimum height 50ft. It stands upon a stone foundation—the stone being obtained from the Government quarries at Angel Island. The entire cellar and area floors are covered with concrete. The walls are built of well-burned brick, and the facings are of pressed brick. The trimmings on all the five walls above the roofs are terracotta. The basement contains twelve store-rooms.

"On the first floor there are two soldiers' dormitories, each 46ft. by 50ft.; two mess halls, each 33ft. by 30ft.; two kitchens, each 22ft. 6in. by 34ft.; two rooms for commissioned officers, and two company offices.

"The second floor has two large dormitories, each 46ft. by 40ft., and two smaller ones about 40ft. square each. Here are located barber shops, tailor shops, and reading-rooms for the men. In the attic there are seven rooms, which for the present will be used as store-rooms.

"Each building will accommodate two companies, or about 120 men. . . ."

"The sanitation will keep pace with the high character of the other improvements. A perfect sewerage and drainage system with ocean outlets will be constructed at a cost of possibly 30,000dols.—these figures being subject to material decrease or increase as the plans finally adopted affect the cost. . . ."

"On the heights and along the valley boundaries of the coast, battalions of trees—great American pines—will be planted, to break the force of the ocean gales. . . ."

"Then in the list of expensive improvements is the tree purchasing and planting. When this has been accomplished the Presidio will look thereafter like a forest, with broad roads cut through, and wide open spaces for buildings and for the accomplishment of military evolutions. Already a contract is about to be let for 66,000 pine trees. It is required that the trees be 'good, healthful, two-year-old pines, raised from seed planted in 1893-94.' This army of pines will be received at the Presidio in the months of January, February, and March of next year, and will be planted in single file along the outer boundaries of the Presidio and along the neighbouring hills.

"Following is a tabulated statement of the principal improvements contemplated :—

Improvement.	Estimated Cost Dols.
Seven double barracks at a cost of 40,000dols. each	280,000
Twenty brick and stone buildings, for officers	100,000
Six brick and stone stables	30,000
Waterworks plant (completed)	20,000
Tree planting	15,000
Road improvements (under way)	6,000
Fences and gates	10,000
Parade ground	10,000
Sewerage system	30,000
Total	501,000"

Having noted these facts, it may be interesting to make some comparisons between the methods of building barracks in America and this country, also to compare the relative costs.

The American soldiers are housed in double-company barracks, and each building provides dormitories, mess-halls, and kitchens, barber's shops, &c., and reading-rooms for the men, as well as two rooms in each barrack building for commissioned officers—one to each company. Presumably these latter are junior officers, located with the men for purposes of discipline.

English soldiers are housed in single-company barracks. They have no mess-halls, taking their meals in the same rooms they have used for sleeping purposes during the night. The kitchens are separate from the barrack buildings, as are also the workshops, reading-rooms, &c. The officers are all housed in a large mess-block, and none of them are detailed to live in the same buildings with the men. Probably we are not yet sufficiently educated in democratic principles to permit of this.

As regards cost, the American barrack buildings appear, at first sight, somewhat more expensive than our own. Theirs work out at about £66 per man, whereas ours can be built for £44 per man; but considering the extra accommodation given in the American type, a part of which has to be provided for with us in separate buildings, the costs do not seem to show any very considerable difference.

◆

THE LOCOMOTIVE SERVICE OF LONDON.

AN exhaustive report on the locomotive service of the Metropolis has just been published by the Statistical Department of the London County Council. It forms the first part of a return to be issued, and consists of a volume of nearly 200 pages, the information being confined to a detailed statement of the particulars of the existing tramway, omnibus, and steamboat services. Other parts still to be prepared will deal with the particulars of the railway and canal service, and the local distribution of the traffic, and will include an examination in detail of the present system of locomotive service, and of the requirements to meet the needs of London. Part I. of the return is divided into four sections, and the particulars of locomotion, the routes, distances, fares, accommodation, workmen's tramways, omnibuses, and steamboats in London are tabulated. The eleven Metropolitan tramway companies work 71 different routes, 33 on the north and 38 on the south of the Thames, although the actual number of routes in use is only 58—29 in the north and 29 in the south of London. The Highgate Hill cable line is not included in the return, as it has not been used for public traffic for over two years. The total length of the 71 routes is 221·27 miles, of which 7·47 miles only are not used. The longest route is possessed by the London Company—viz., 69·76 miles (not including a northern branch), and the shortest by the Harrow-road and Paddington Company—viz., 1·81 mile. There are 623 fares, varying between ½d. and 3d. per journey. There are 31 3d. fares, 10 2½d. fares, 97 2d. fares, 79 1½d. fares, 265 1d. fares, and 141 at ½d. The average mean rate per mile of the fares for the entire routes is ·67d., and the average mean speed of the cars per hour is 5·48 miles. The mean sitting accommodation provided in the cars is: Inside, 19·83; outside, 23·21; total, 43·04. The average number of single journeys made each day by the whole of the cars possessed by the several companies is 17,148, the cars required for which number 879. The average time which the cars run daily is 16 hours 44 minutes. The total length of line authorised for the whole of the companies is 153 miles, and the actual length of line open for passenger traffic in the administrative county of London is 136 miles.

◆

ARCHITECTURE AND BUILDING CONSTRUCTION CLASSES IN GLASGOW.

THE *Calendar* of the Glasgow and West of Scotland Technical College is an octavo volume of 300 pages, and represents very fully the arrangements of the college, its teaching staff, and constitution. The day and evening classes and syllabuses are numerous, and cover the whole field of physical and technical education. Engineering and architectural students can here acquire all they need to equip them for their respective professions. The diploma course for the first year includes mathematics, natural philosophy, chemistry, drawing; and the students have the use of workshops. The second and third years include, amongst other subjects, civil engineering and surveying, materials of construction, applied mechanics, electrical engineering, technical chemistry, photography, mining, agriculture, and architecture, and it is more particularly to the latter we wish to draw attention. The day classes in architecture is a new feature. These classes meet twice a week — Mondays and Thursdays — and are under the management of Professor Gourlay, A.R.I.B.A. The junior course of sixty lectures comprises art, construction, and design, with instruction in the studio. The senior course, also of sixty lectures, includes, in addition to the three branches above, professional practice, and, of course, each subject is more fully developed. The section on Art will include the characteristics, history, and development of the principal styles, with the mouldings and ornament appropriate to each style. The section on Construction will comprise the principles of hygiene; nature and properties of building materials; principles of stresses and strains, formulæ for their calculation and their graphic determination; principles of construction, and their application to foundations, walls, arches, vaults, girders, floors, roofs, &c. Under Design, buildings of moderate dimensions, details of construction and ornament to scale, are given; and under Professional Practice, specifying, estimating, and measuring; also the duties and responsibilities of client, architect, and builder. The evening classes are arranged to supplement the office training of pupils, and to prepare them for the R.I.B.A. examinations. The first course deals with Classic architecture till the end of the Roman period, and includes an analysis of Greek and Roman buildings, the Orders of the Renaissance, &c.; the second course is on Mediæval architecture, and is specially arranged for Scotch students. English and French Mediæval is first dealt with, and then the Scotch, showing the influence of the two former upon the latter during the same period. In the third course, "History of Architecture," the lecturer will deal particularly with Byzantine and the Renaissance periods. In each course there are 30 lectures, illustrated by photographs, drawings, and lantern views. The analysis of the Classic and Mediæval periods are useful features of these courses, especially for those preparing for the "testimonies of studies" required for the Intermediate examination of the R.I.B.A. There is an architectural studio under the management of Mr. Jas. Lochhead, A.R.I.B.A. The lectures and classes on Building Construction and Design are arranged in three courses. The first course treats of the various trades and the processes and methods used; the second course deals with the application of the trades to foundations, brickwork and masonry, roofs, girders, centres, joinery, floors, and the nature and application of materials; and the third or "Honours" course with calculations for structures, materials, ventilation and warming, water, sanitary subjects, and professional practice. Instruction in design and the preparation of working and scale drawings is given in this course. Courses of lectures on brickwork, carpentry and joinery, plumbing, and other practical trades are also given. We recommend all students to obtain a copy of the Calendar and syllabuses of the courses. The fees are very moderate.

THE INCANDESCENT GAS LIGHT IMPROVEMENTS.

WE have received the new illustrated price list of the Incandescent Gas Light Co., Ltd., of Palmer-street, Westminster, &c., and beg to call the attention of our readers interested in this exceedingly popular and excellent light to the great reduction made by the company in the price of the burners. Last year the price of the ordinary "C" burner was 15s., and owing to the unprecedented increase in the use of the light, the company were enabled to reduce the price to 10s. 6d. Since then an enormous increase in the sale of the burners has led to a further reduction in price to 9s., a step taken wisely, we think, in order to still further popularise the light. The "by-pass" and other forms of burners have also been reduced. The several kinds of burners manufactured by this firm, including the "C" burner with by-pass, and those having governor and by-pass, are described and illustrated. We lately drew attention to the great advantage of these additions. The "by-pass" arrangement enables the Bunsen burner to be relighted by simply raising a small lever. When turned down the Bunsen flame is extinguished, but a small jet is kept alight inside the mantle. These arrangements effect a great economy in the use of gas, and are clearly described in the catalogue. For lights over reaching distance, as for halls and churches, a lever tap, with chains, is provided, and this burner we have lately seen introduced in a large church at Streatham, where the old gas coronæ, which cast awkward shadows, have been removed. The soft white light is a remarkable success. The two-light and three-light clusters, shown on p. 9, are an excellent form of application of the "Switch" light burner, introduced by this company for halls and large buildings, where it is necessary to turn the light on and off from one point. The burners fitted with anti-vibration springs to counteract the tremors caused by traffic in streets are useful, and the springs are also admirably adapted for any burners subject to vibration. The ventilating lamps illustrated are clever adaptations of this light for smoking-rooms and other places. The company have also introduced shorter chimneys and the "Jena" form has been found superior to any other kind of glass chimney. The fluting of the glass is another improvement, and we recommend purchasers to use the fluted chimney sold by this company, who have made the manufacture of this requisite perfect. The patterns for shades and globes illustrated are worth notice for their elegance, and are suitable for drawing-rooms and other rooms where tasteful forms and tints are desired. Many forms of pendants and reflectors are illustrated, and deserve attention.

GLAZED AND DECORATED TILES.

MESSRS. T. AND R. BOOTE, Ltd., of the Waterloo Potteries and Patent Tile Works, Burslem, and of Waltham Buildings, Holborn Circus, E.C., have just issued a new illustrated catalogue of their glazed tiles suitable for grates, hearths, furniture, and various other purposes. Since the last catalogue was published, a considerable reduction in the prices has taken place. The illustrations produced in chromo-lithography are a very particular feature of the book before us; and they give a very admirable idea of the patterns and colours. In the first part of the catalogue, several plates of tiles, brown on cream, olive on white, and other tints are given, neat in design. These are drawn to a third full-size of the tiles, which are 6in. square. Coloured tiles follow in a great variety of designs, many of them of floral character. Several plates of embossed tiles, varying in price from 4s. 3d. to 5s. per dozen, represent a great variety of colours in browns, buffs, greens, and blues, suitable for grates, wall and furniture decoration. The patterns given on Plate 15 are adapted more particularly for decorative purposes, borders, corners, friezes, and panels; many of these are 12s. 6d. per square yard. Old gold, mahogany, rich greens and blues are among the colours. The series of floral pattern designs unslabbed for hearths exhibit much diversity of pattern and colour. Plate 21 illustrates two slabbed hearths, one of 22 tiles which can be made any size, the other a design of folial character. A very rich unslabbed hearth, with floral design on ground of shades of old gold and red, is noteworthy; also the hand-painted panels on the same (Plate 24). The designs for hearths on Plate 29 are also unique and simple, being a panel with floral design on a tile ground of mahogany and old gold. Several of the designs are new, and have a freshness. The price list accompanying the catalogue is worth particular attention by all builders, and those who are requiring tiles, plain, coloured, or embossed, will do well to consult Messrs. T. and R. Boote's catalogue.

JAPANESE LEATHER PAPER.

SOME years ago, the Japanese Government established an imperial press, which does all the printing work of the Government, from postage stamps and postcards to paper money. One of the specialities of the establishment is the manufacture of leather papers, which has been brought to a great degree of perfection. The Japanese, taking as a pattern some of the finest European leathers, have succeeded in applying their own peculiar methods of manufacture, and fashion them according to the Japanese taste. The first step is the engraving of a block, consisting of a large, hard wooden cylinder, hung on to a frame, which is engraved with a knife or chisel, the worker following the model with great precision and exactitude. When the block is ready, it is covered with moist paper, which is folded and pressed on to the mould, then taken off and hung across a bamboo to dry. When it is thoroughly dried, by exposure to the air, decoration is commenced. The paper is now spongy, and almost as absorbent as blotting-paper. It is now covered with several coatings of glue, which makes the surface smooth and non-absorbent. The paper is then figured, metallised, and varnished, and the figured design then stands out, as if gilt. The Japanese have the monopoly of the best lacquer varnish. It is this lacquer varnish which gives a golden appearance to the metal, and the exact colour is at the discretion of the worker. The final operation consists in the arrangements of border patterns, by means of stencil plates—an operation performed by young girls, who also touch up the border work, erasing all smudges and filling up blank spaces, &c. The rolls of paper are then hung up again, and when dry are ready for the market. They are sent first to Yokohama, and thence all over the world.

THREE TOWNS ARCHITECTS.

AMONG the architects who, on Saturday, accepted an invitation to attend at the offices of Mr. G. H. Luff, Devonport, to consider a suggestion that an architectural society should be formed for architects and assistants in the Three Towns, Plymouth, Devonport, and Stonehouse, were Messrs. Dwelly, Greenwood, Harris, Leest, Luff, Mill, and B. Priestley Shires. Several letters of regret at being unable to attend were received from leading architects. On the motion of Mr. Luff, seconded by Mr. Greenwood, Mr. Priestley Shires was elected to the chair, and Mr. Edgar Leest was appointed honorary secretary *pro tem.* The chairman explained that the meeting had been called at the suggestion of Mr. Leest. He (Mr. Shires) thought it was very desirable that a society should be founded in the Three Towns to promote a due appreciation of architecture, and to lessen the disadvantages under which its younger members at times labour. With a knowledge of the many points in municipal and local government by which the architects of this country are affected, it was highly important and extremely desirable that they should possess a strong representative and useful society, which should be in a position to speak with the authority of wide influence and the strength of union on many occasions, when to have such a means of expression would conduce to the general benefit of the profession. Mr. Luff proposed, and Mr. Dwelly seconded,—"That it is highly desirable to form an architectural society in the Three Towns, and if terms can be arranged, to make it a branch of the Devon and Exeter Society." The motion was carried unanimously. A vote of thanks was accorded to the chairman, on the proposition of Mr. Greenwood, and seconded by Mr. Luff. The hon. secretary, *pro tem.*, mentioned that he would be pleased to correspond with any architects or assistants who might require information, on application to Laboratory House, Mount Wise, or 64, Chapel-street, Devonport.

CHIPS.

The Bill introduced by Mr. Akers-Douglas and Mr. Hanbury to provide for the acquisition of a site for public offices in Westminster authorises the Treasury to issue out of the Consolidated Fund sums not exceeding £45,000, as they may be required by the Commissioners of Works for the purchase of such sites.

A new Wesleyan chapel is to be built at Devizes in connection with the Wiltshire Mission. The chapel will hold 450, and the school 250. The total cost will be £2,500.

A block of parish council buildings is about to be built at Gillingham, Dorset, from plans by Mr. Miles, of Bournemouth. The accommodation will include a small council-chamber, together with a clerk's or committee-room, a living-room and kitchen, back kitchen, usual offices, four bedrooms, and a store-room. The estimated cost is £800.

Mr. Bird Clerke, an inspector of the Local Government Board, held an inquiry at Oldham Town Hall, on Friday, into the application of the Oldham Corporation for sanction to borrow £40,000 for purposes of sewerage and sewage disposal, and £15,000 for the purposes of electric lighting. No opposition was offered to the council's proposals with regard to either matter.

A serious fire occurred in the Montpelier district of Bristol on Sunday, resulting in the destruction of the Salvation Army barracks, a wooden structure, and injury to the extent of £2,000 to the heavily-stocked yard of Messrs. Love and Waite, builders, and to several cottages abutting on the barracks.

The partnership heretofore subsisting between R. Bennett and F. W. Jackson, architects and surveyors, Cheapside, E.C., under the style of Bennett and Jackson, has been dissolved.

At Aberdeen, on Friday, the plans committee of the town council sanctioned plans of new buildings of a total value of £8,500.

A scaffolding upon which five men were working, in connection with the erection of a new chapel at the Good Shepherd Convent, Limerick, collapsed on Friday, and the men were precipitated a distance of 30ft. One of them, a mason named John McGrath, received such injuries that he died within a short time. The others were badly injured.

A project is on foot for the construction of an overhead railway from Waterloo Station to the City. All the necessary surveys have been made, and the Bill authorising the undertaking will be promoted in the next Session of Parliament by the South-Eastern Railway Company. The new line will compete with the underground electric system now in process of completion, connecting the South-Western Railway with the City at an almost identical point.

A stained-glass window has been presented to the Dalrymple parish church. It was designed and executed by Mr. Stephen Adam, of Glasgow, and illustrates the text, "Abide with us, for it is toward evening."

The valuable property of the Bourne Valley Pottery, Bournemouth (Henry Sharp, Jones, and Co., Ltd.), was offered by auction on Thursday week by Messrs. Hankinson and Son, of Richmond Chambers, Bournemouth. The sale was held in the brickmaking house on the premises. The auctioneer, Mr. T. J. Hankinson, on introducing the property, referred to the long time the business had been in existence, and informed the company present that it would be sold in one lot as a going concern, including everything with the exception of the book debts. After a considerable number of queries had been put and answered, an offer of £10,000 was made; this was quickly increased to £15,000, and the property was eventually sold for £20,005, the purchaser being Mr. Frederick Sharp.

YORK CITY IMPROVEMENTS: NEW BUILDINGS, DUNCOMBE PLACE.

These buildings are now in course of erection on the southerly side of Duncombe-place, lately widened and opened out by the removal of certain buildings, of an old-fashioned character, at the cost of the York City Council. By this change an important vista has been opened out, affording, as stated by Mr. Waterhouse, R.A., in his report to the city authorities when advising on this line of improvement, one of the finest cathedral views in the country. On entering York from the bridge which leads from the railway station, the above description appeals at once to the visitor, and the accompanying drawing will enable the reader more clearly to follow it, the Old Minster being in the centre, the modern St. Wilfrid's on the left, and the right of the picture being occupied by the new buildings just started. Owing to the requirements of the line of improvement, it has left the outline of the site, especially at the front or Blake-street end of it, of an irregular-angled shape. The beauty of the position will be improved by the grass lawn, which will always be preserved unbuilt upon in front of the new buildings. The first portion, now begun, forms a block of offices for Messrs. Gray and Dodsworth, solicitors, of York. The sheriffs' offices will also be located here. The contract has been let to Messrs. Parker and Sharp, builders, of York, and the designs are by Mr. Edmund Kirby, F.R.I.B.A., architect, Cook-street, Liverpool.

DECORATION OF THE SANCTUARY AT ST. JOSEPH'S R.C. CHURCH, HIGHGATE.

The drawing shows the proposed high altar and mosaics for the east end of the Church of St. Joseph's Retreat, Highgate. The altar is to be principally of marbles, with a figure of the dead Christ in the altar tomb guarded by sentinel angels, with the twelve Apostles in the reredos, surmounted by Our Lord of the Sacred Heart. Above all is the Crucifixion in mosaic, surrounded with busts of the prophets with appropriate texts. The sculptor is Mr. Thomas Grew, of 4, Salisbury Mews, Gloucester-place, W.

THE TOWERS AND PORTALS, BARCELONA CATHEDRAL.

The streets of this famous Spanish city present, at any rate in the heart of the town, a sordidly dull and entirely unpicturesque appearance, and the thoroughfare, with its lofty drab-coloured façades leading to the cathedral, is, perhaps, the most dingy of them all. The precincts of the great church scarcely realise an ideal cloister, but the grand Gothic portal which bursts suddenly on the view, midst a wealth of orange-trees of great size, is a sight long to be remembered, and so are the tree-like plantations of big geraniums, while the fountains splash in the gaiety of the sunlight. The Canons' geese, too, kept in the largest of the fountains, make another feature, for they have been maintained here from the earliest times, according to the ancient Catalonian custom, for the purpose of guarding the treasures of the diocesan church, a service which the faithful believe the birds are enabled to perform far more efficaciously than any watch-dogs obtainable. The solemn Canons pace up and down the pavements of the Fontana de las Ocas, reciting to themselves their appointed task of psalms from their breviaries; endless beggars pester politely for alms midst the throng of passers-by, the men dressed in their bright mantas and scarlet barrettas, the women in their blue petticoats, and white handkerchiefs furnishing their only head-dress. Jacques Fabra designed the cathedral buildings in the beginning of the 14th century, though the church was really begun as early as 1298. "It is beautiful and solemn," says Augustus Hare, "beyond description, only faintly lighted by the rich stained-glass windows at either end, whose coloured lights are almost lost amid the many chapels and tall reed-like pillars." The portal, which we illustrate from the pen-sketch of Miss Marion Logsdail, is the principal entrance, and is called "La Puerta de la Inquisicion," because it faces what remains of that building. Beneath the altar lies the body of Santa Eulalia, the patron saint of Barcelona, the "well-speaking" virgin martyred by Dacian in 309, when, report says, she was seen ascending to Heaven in the form of a dove. The mortal remains of Eulalia were transferred hither from Santa Maria del Mar in 878, when two kings, three queens, and four princesses attended her burial with great pomp and magnificence, while the dignitaries of the church were present with appropriate consequence. Since then Spanish sovereigns down to Christian and Isabella have been true to the custom of passing the night in prayer before her shrine. There is another saint here also, one Oldagar, who died in 1137, and was discovered, they say, some five hundred years after, "quite uncorrupted, except the tip of his nose." This was a remarkable circumstance, and, moreover, this saint's good offices are usually invoked by the daughters of the church in childbirth. His sleeping effigy is raised aloft over the altar of the first chapel on the right of the nave. From beneath the organ hangs a hideous Saracen's head, with gaping mouth, starting eyes, and a vast flowing beard. The purpose of this fright was to animate the zeal of intending Crusaders. The cloisters and bell towers are of the same period as the church, and possess a quaintness and freshness of style all their own. Miss Logsdail's sketch well realises the effect of the intense light of the Spanish sunshine.

HOUSE AT BOWDON.

This house was erected some three years ago for Mr. Richardson. Several comparatively minor alterations were made in the place and also the design. It was faced with Ruabon brick and Bath stone, the outside woodwork being oak. The whole of the furniture has been, and is being carried out from the designs of the architect. One feature of the interior decoration is the use of painted friezes, specially painted and designed by Manchester painters, one of which, by Mr. Jackson, was lately exhibited at the Manchester Arts and Crafts. Mr. Martin Stone, of Altrincham, was the builder; Mr. Edgar Wood, A.R.I.B.A., of Manchester, the architect. The drawing we illustrate was hung at the recent Royal Academy Exhibition.

"EVENTYDE," ST. JOHN'S, WOKING.

This house, illustrated herewith from the Royal Academy drawing, is built of brick covered with 1in. of Portland cement rough-cast, and the roof is of green slates. The work was carried out by Mr. E. C. Hughes, builder, of Wokingham, under the direction of Mr. Walter Cave, architect, of 40, James-street, Buckingham Gate, S.W.

COVENTRY MUNICIPAL BUILDINGS: ACCEPTED DESIGN.

We print to-day a detail drawing showing a portion of the front facing Bailey-lane, where the old and the new work will be connected. On July 26th last we published views and plans, with descriptive letterpress, of this same design, which is about to be carried into execution. It was chosen in the recent competition, when Mr. Charles Barry acted as professional referee. The joint architects of the work are Mr. Harry Quick, of Coventry, and Messrs. Brewell, Baily, and Mallows, of Nottingham and Bedford.

RYDAL MOUNT SCHOOL, NORTH WALES.

The new gymnasium at Rydal Mount School, which we illustrate to-day, has recently been completed for Mr. T. G. Osborn, M.A., J.P., the head-master, from the designs and under the superintendence of Mr. T. E. Lidiard James, F.R.I.B.A., of Lonsdale Chambers, 27, Chancery-lane, London, the architect to the school. The tendency to heaviness in a building of this character has been obviated by treating the upper portion in half-timber work. Arrangements have been made for the addition of racquet courts on the east side at a future date. The gymnasium is fitted up with the usual most approved modern gymnastic appliances. The builder was Mr. J. Berth Jones, of Colwyn Bay.

SKETCHES AT HABERDASHERS' AND VINTNERS' HALLS.

We illustrate to-day some more details of old woodwork and furniture from the halls of the City Guilds, our sketches being gathered from the Haberdashers' and Vintners' Companies. The wall-cupboard and coat-of-arms are both let into the Binding Room wall at the first-mentioned Company's premises in Gresham-street. The cupboard dates from the period just after the Great Fire, and incloses the parchment roll of subscribers, assistants, livery, and yeomanry, to the New Buildings, commenced in 1668, as well as a list of the plate, "guilt and white," with the names of the benefactors. The dimensions of this cupboard, which is black with age, are 3ft. wide and about 4ft. 7in. in height, and the carving is in a capital state of preservation. It is unknown how the coat-of-arms—a very bold and excellent piece of sculpture—came into the possession of this Company. It once formed the panel in the overmantel of a chimneypiece, and is said to be the coat-of-arms of the Earl of Essex, the unfortunate favourite of Queen Elizabeth. The master's chair, from the Court Room of the Vintners' Hall in Upper Thames-street, graceful in the lines of its curves, and appropriately and skilfully carved, shows the hand of a consummate master of his craft. It is in dark oak, and is upholstered with scarlet felt. The arms of the Company are cut in the shield under the head of what is apparently an infant Bacchus, the foliage and fruit of the vine being much in evidence. The carved sword-bracket occupies a position by the side of the door into the Great Hall. It is some 7ft. or 8ft. high, and is used for receiving the sword of the Lord Mayor when the guest of the Company, the head of the hilt resting on the projecting shell at the foot of the vine, the point of the blade being pushed up inside the lion's mask under the crown. About midway in the length, on either side, is a shield, one with the arms of the City, and the other of the Vintners' Company. The scroll-work displays much ingenuity and freedom of design. The hall itself, attributed to Sir C. Wren, contains some fine carving, upon which some skilful carver (possibly Grinling Gibbons) must have been employed, and it is probable that the sword-bracket here illustrated is of the same period.

At the last meeting of the streets and buildings committee of the Edinburgh Town Council yesterday, it was reported that the Prudential Assurance Company had sent a communication to the town clerk agreeing to construct their new buildings in St. Andrew-square of stone, instead of red brick as originally proposed. The architects are Messrs. Alfred Waterhouse, R.A., and Son.

The annual business meeting of the Sanitary Association of Scotland was held on Friday night in the saloon of the Town-hall, Greenock, the chair being occupied by the president, Professor Matthew Hay, Aberdeen. The secretary, Mr. D. M. Alexander, writer, Glasgow, read the council's annual report: and the treasurer, Mr. J. B. Stobo, Rutherglen, submitted the financial statement, which showed a balance in hand of £42. Dr. J. B. Russell, Glasgow, was appointed president-elect; Mr. Gilbert Thomson, C.E., Glasgow, and Dr. Chalmers, Glasgow, were elected vice-presidents; and the secretary and the treasurer were re-appointed.

Building Intelligence.

Berlin.—The celebration of the anniversary of Sedan commenced on Sunday with the opening, by the Emperor and Empress, of the memorial church which has been erected in Charlottenburg, Berlin, to the Emperor William I. The church is built in the Late Romanesque style, in the form of a Latin Cross, the nave being comparatively short. It will seat a congregation of about 2,000 persons. The church is built mainly of sandstone. It has five towers, the central and highest of which is over 370ft. in height. It is surmounted by an Imperial Crown of stone, weighing 24 tons, from which rises a gilded cross, 22ft. 9in. high, and weighing nearly a ton. The clock is the largest in Berlin, the dials being about 30ft. in diameter and the long hands about 10ft. in length. The peal of bells is among the finest in Germany. The interior of the church is entered through a lofty, arched tribune, which is to be adorned with paintings representing episodes in the late Emperor William's life. The interior and the windows will be richly adorned with pictures of Biblical scenes. The interior is not nearly finished as yet. The total cost of the building, which has been erected by voluntary contributions, is estimated at £250,000, including more than £75,000 for the site. Herr Schwechten is the architect.

Boscombe.—On August 22 the foundation-stone of a new church for the Jesuit Fathers of Bournemouth was laid at Boscombe by the Bishop of Portsmouth. The new church was dedicated to the Blessed Sacrament, and will be called Corpus Christi Church. The building itself and the site are given by the Baroness Pauline von Hügel and other benefactors, at the cost of about £9,000. The church will be a plain but substantial brick building in the Early English style, with internal Bath stone dressings. The total length of the building will be 125ft., which will comprise a nave 68ft. by 22ft. (with side aisles each 7ft. wide), a sanctuary 31ft. by 22ft., a nuns' transept on the north side of the sanctuary, and a Lady-chapel 22ft. by 8ft. on the south side, a sacristy 18ft. by 17ft., and a boys' sacristy 16ft. by 7ft. At the west end there will be two porches and a baptistery. There will be a chancel arch and a stone arcading beneath the clerestory windows. The fixed seating will provide accommodation for between 400 and 500 persons. Mr. J. W. Lunn, of Great Malvern, is the architect, and Messrs. Jenkins and Sons, of Portsmouth, are the contractors.

Clerkenwell.—The new Northampton Polytechnic Institute, for which a principal has just been appointed, is on the eve of completion. It is one of the finest in the Metropolis, and has been erected at a cost of nearly £100,000, or it will have cost that eventually. Of this sum, £30,000 is the estimated value of the acre and a half of land or thereabouts given by the Marquis of Northampton. The Polytechnic occupies an isolated site, bounded by St. John's-street-road, Lower Charles-street, Ashley-street, and Northampton-square. The chief internal features will be a public hall, capable of seating 1,500 people; a gymnasium 120ft. long and 55ft. wide; a swimming-bath of the same dimensions; club rooms, refreshment-rooms, library, and reading-rooms, and 28 technical workshops. Facilities will also be provided for teaching women cooking and dressmaking. The building is from the designs of Mr. E. W. Mountford, F.R.I.B.A., selected in competition, and illustrated in the Building News for August 21, 1893. It is Renaissance in style, and is carried out in red brick and white stone dressings, with green slate roofs. There has been some delay in the acquisition of property that it has been necessary to clear away before the workshops could be undertaken, and that part of the Institute has therefore had to be left in arrears. The main building, however, apart from its range of workshops, is on the point of completion. It will be fitted throughout with the electric light.

Glasgow. — The Eglinton-street Congregational church, Glasgow, has for the last two months been undergoing a process of renovation internally, which has this week been finished. About six months ago the deacons asked Mr. W. J. Anderson, A.R.I.B.A., to submit drawings of a scheme of colour decoration, and suggest improvements in lighting, and the designs which he submitted are those which have just been carried out to his full-size drawings and directions. The ornamental work is largely founded upon Continental examples of Romanesque polychromatic decoration. A unique feature is the treatment of the eastern wall, extending for the full width of the structure, and blank except for a small circular window; the motive being a veil of gold cloth divided by illuminated bands, hung vertically at irregular intervals and of different colours. On these are emblazoned in gold the emblems of the Saviour, as found in Early Christian buildings, suggesting to some degree the iconostasis of an Eastern church, with the important difference that it does not intervene between the people and the ordinances. Mr. James Moodie, of Sauchiehall-street, carried out the painting, while Messrs. J. Milne and Sons, of Edinburgh and Glasgow, supplied to the architect's drawings the wrought-iron and copper coronas.

Middlewich, Cheshire.—The parish church of St. Michael and All Angels, Middlewich, was reopened for service last week, after having been restored from plans by Messrs. Douglas and Fordham, architects, Chester. The principal work executed is the new carved oak reredos; this has been executed by Mr. J. J. Millson, sculptor, City-road, Manchester, at a cost of £214, and was exhibited at the Manchester Corporation Arts and Crafts Exhibition. The style is Late Decorated. There are five vertical divisions. The central panel represents the Nativity; the subjects on the left are the Annunciation and St. Michael, and on the right the Adoration of the Magi and St. Gabriel. The backgrounds of the panels are gilded. The work was from the designs of the architects to the restoration of the church. The great east window has been raised to a height of 3ft. above its former position; this contains stained-glass representations of St. Michael, with the dragon at his feet. The chancel and sacrarium have been re-tiled by Messrs. Maw, a deeply-coloured enamelled centre tile being surrounded by others of terracotta hue. The masonry of the chancel wall has been repaired. The raising of the windows and construction of the side windows has been carried out by Messrs. Beckett and Co., of Hartford, whose contract amounted to £205. The organ has been repaired by Messrs. Young, of Eldon-street, Manchester, and several improvements have been made in the instrument. The total outlay on repairs and decorations has been nearly £700.

Newcastle-on-Tyne.—The Stephenson branch public library at Newcastle, which has been built on a corner of Elswick Park at a cost of £4,000, borne by the present mayor of the city, Alderman W. H. Stephenson, is approaching completion. The architect is Mr. John W. Dyson, of that city, and the contractor, Mr. Walter Scott, also of Newcastle. The style is English Renaissance, the building, which consists of ground and first floors, and occupies an area 43ft. by 86ft., being constructed of red Leicestershire bricks, with stone dressings, and roofed with red Ruabon tiles. A small tower stands over the western entrance hall, and the end and central windows of both the north and south elevations are projected from the front and finished with a gable, that over the centre on the north side being surmounted by a stone pediment. A stone shield immediately beneath bears the arms of the city, and another over the side of entrance has on it the crest of the donor. The mullioned windows have leaded panes of clear glass, except at the west end, where the hall staircase is lighted with a stained-glass window. The central doorway from Elswick-road gives access to the ground floor, on which are provided a refreshment room, committee-room, ladies' reading-room, a large general reading-room, smoke-room, lavatory, &c. The basement is occupied by a kitchen and the heating apparatus. The lower rooms are 12ft. high. Upstairs, the chief feature is the hall, 70ft. by 35ft., which it is proposed shall serve as the library and also for meetings, &c. It has a hammer-beamed roof, of yellow pine, the ceiling being formed in panels with moulded ribs. The height from floor to ceiling is 23ft., and to wall-plate 14ft. 3in. At the east end there is a platform, and there are also on this floor retiring, committee, and caretaker's rooms. Stained canary wood has been utilised for the construction of the doors and most of the internal woodwork, though the hall staircase is in pitch-pine with canary-wood handrail. Ventilation has been provided all over the building by air-shafts, the vitiated atmosphere being carried away and discharged through a turret at the south-west corner. The premises are to be illuminated by electricity.

Wistanstow. — The reopening of Wistanstow parish church was recently performed by the Bishop of Hereford. The improvements comprise building a new vestry and organ-chamber, partly reseating the body of the church, making sundry improvements to the organ, restoring the old oak (Perpendicular) roof of the nave, recolouring the outside walls and roofs of the building throughout, making a new dormer window in the church, and various other small additions and alterations. The architect is Mr. A. E. Lloyd-Oswell, Dana-chambers, Shrewsbury. The organ, which was originally built by Hill and Son, London, was taken in hand by Messrs. Halmshaw, Camp-hill, Birmingham, and is very much improved. The church, which is a cruciform building, has a Norman doorway, and also a Norman font. Until lately the organ stood in the chancel, which was much blocked up; the effect of putting it into a chamber has been to exhibit the fine proportions of the old chancel and the encaustic pavement, which some years ago was laid down by the present rector. The new arrangements necessitated the making of a dormer window in the chancel roof. The building of a vestry has supplied a want that has been felt for many years: there appear to be no traces of one ever having existed before. The removal of the old high pews in the body of the church (though only partially done), has had a good effect in showing the proportions of the nave, with its 15th-century carved oak roof. A light wooden chancel-screen has been erected.

CHIPS.

The committee for the erection of the Adam Smith and Beveridge Memorial Halls, at Kirkcaldy, have finally adopted the plans of Messrs. Dunn and Findlay. The buildings will be faced with red stone from Corncockle, and will cost about £14,000. To meet this outlay the committee have £16,000 in hand, but the contracts have not yet been let.

A new font, octagonal in form and Perpendicular in style, has been dedicated at Empingham parish church, co. Rutland. It was designed by Mr. J. C. Traylen, diocesan surveyor, Stamford.

An organ has just been erected in the parish church of Plaistow, by Messrs. Henry Jones and Sons; and another, built by Messrs. H. Speechly and Son, has been placed in the neighbouring parish church of West Ham.

The ceremony took place on Monday of laying the memorial stones of the new Calvinistic Methodist chapel in Warren-road, Rhyl. The present chapel was built some 25 years ago, and despite frequent additions the building has become too small to accommodate the worshippers. The site of the new building is in the same street, a few yards higher up. The building is in the Elizabethan style, and will seat about 600 people. The total cost is about £2,000. The architect is Mr. Thomas Parry, J.P., of Colwyn Bay, and the contract has been intrusted to Mr. Hugh Jones, builder, Rhyl.

Sanction has just been received by the Nelson Corporation from the Local Government Board to borrow £30,000 for private street improvement, £8,000 for works of sewerage and sewage disposal, and £1,641 for the construction of a bridge, and improvements in Leeds-road.

At the last meeting of the Bradford School Board tenders were accepted for a new infants' department at Princeville school, amounting to £2,642 5s., being at the rate of £10 17s. 8d. per head.

The Marchioness of Londonderry opened, on Monday, the new Workmen's Institute at Silksworth Colliery, where the whole of the miners are employed by the Marquis of Londonderry, who has been at the entire cost of the building and interior furnishings, amounting to about £1,000.

Further reports as to the mischief caused during last winter's frost to water mains laid too near the surface continue to come to hand. At the half-yearly meeting of the South Staffordshire Waterworks Company held at Birmingham on Friday, the chairman said that they had had to relay about nine miles of pipes, or 5,000 mains. The maintenance of works had been increased by the frost from about £2,000 to £6,000.

The new technical school which has been erected by the corporation of Accrington was opened last week by Alderman Snape. The building, the exterior of which is entirely of stone, is in the Blackburn-road. Accommodation is provided for the teaching not only of technical subjects, but of art and science. Mr. Henry Ross was the architect, and the cost was about £12,000.

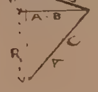

FIG. 4.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—XXII.

THE necessity for introducing additional members in open web-girders and trusses to prevent deformation, or, in other words, to fulfil certain theoretical requirements, has been freely demonstrated in previous articles. But, as has been already pointed out, it becomes indispensable in practice to supplement these theoretical extra members by others, which are not strictly required for the sole purpose of insuring indeformability and permanent stability to the entire structure when subjected to the action of only a uniformly distributed load. We have now, therefore, to consider the reason why these other members under certain conditions of loading must be added. Under these circumstances, they are termed counterbraces, and it remains now to investigate when they can be dispensed with and when not. It is a simple question of the distribution of the load, which, in bridge girders and roof trusses, is always more or less of a duplicate character. In the former the dead or permanent load consists of the weight of the bridge itself, together with that of the platform, permanent way, and any other insistent weight that may have to be provided for. This last-mentioned load in all railway bridges over the Thames now takes the form of at least one foot-bridge outside the principal girders, for, if we mistake not, the London County Council has laid it down as a rule that all railway bridges over rivers within their jurisdiction must provide this minimum accommodation from shore to shore. The railway bridge over the Thames at Charing Cross, which is provided with a foot-bridge, is not exactly a case in point, for that accommodation existed previously in the old Hungerford Suspension Bridge, and the South-Eastern Railway Company, in converting it into a railway bridge, was obliged to afford to some extent the facilities to the public which had been formerly accorded to them. But an example—or, rather, a corroboration of our statement, is to be found in the new railway bridge at Putney, just below the new stone roadway bridge. The former has a foot-bridge thrown out on cantilevers from the main lattice girders. As instances in which railway companies were bound by neither past, present, nor future regulations as to the provision of footpaths, may be quoted the majority of the railway bridges over our great Metropolitan river. An additional load of some 80lb. to 120lb. per square foot of pedestrian area must be allowed for in future London transpontine structures to meet the emergency.

In a railway bridge the live load, which is continually changing its position, is composed of the weight of passing trains, and the force or pressure of the wind, which has not hitherto, and possibly never will, admit of accurate calculation. It can only be estimated on assumptions, which are more frequently than otherwise based upon grounds and data which are both vague and uncertain. At the same time, its amount and violence cannot be ignored or disregarded, especially in large structures in exposed situations. The stresses allowed by the engineer of the Forth Bridge, under the three headings to which we have drawn attention, are the following:—

Stresses due to dead load	2,230	tons.
Stresses due to live load......	1,020	,,
Stresses due to wind load	2,920	,,
Total....................	6,170	,,

So far as roof-trusses are concerned, they are exempt from any actual travelling load, but are equally exposed to the force of the wind as bridges. It is worth mentioning in connection with wind pressure that the first experiments and investigations were made upon the effect of the wind upon inclined—that is, upon roof—surfaces. Counterbalancing is not restricted to the ends of girders for the sole purpose of providing for the want of uniformity in the distribution of the loading. It has to be employed to resist the lateral vibrations and oscillations due to the impactive violence of the pounding action of the enormous driving-wheels of the powerful locomotives in present use. When counterbracing is used in either vertical, horizontal, or inclined planes, to resist the stresses brought upon the girder or truss by the pressure of the wind, it is often included under the term "sway-bracing."

In Fig. 1, let A C D B represent a portion of a girder or truss which, from the general equation (1) and the rules already derived from it, is known to be deformable without the addition of the bar or member C B, or a corresponding bar connecting the points A D. For the present we will restrict our attention to the truss, rendered indeformable in Fig. 1 by the addition of the supplementary bar C B. It will be shown that, under different conditions of loading, this bar acts sometimes as a strut, and sometimes as a tie, and therefore must either be counterbraced in itself, or, as is the more usual method adopted, by introducing another bar in the opposite diagonal direction. In Fig. 1, let the truss be supposed to represent a portion of a railway-bridge girder, sufficiently near the centre to render it unnecessary to regard the influence of the dead load. This latter may be considered as uniformly distributed on each side of the centre, so that the opposite stresses of a different character will counterbalance one another. The manner in which this is accomplished will be demonstrated in treating of the subject in a subsequent article. We may now take the case of a railway train having advanced as far on the girder as the apex D. It is evident that there will be no counterbalancing live load in the form of another train on the other or left-hand side of the girder. In practice, there often is another train; but in the present instance it will be assumed that there is only one. The case of another train advancing on the bridge in an opposite direction will be discussed subsequently. The weight of the engine, which is really the maximum load to be provided for, may be therefore regarded as a concentrated load placed for the moment in passing at the summit of the apex D, and represented by the weight W. It remains to determine the nature and amount of stress induced upon the different bars and members of the truss by this weight, more especially with reference to the bar C B, in order to ascertain whether it is in tension or compression. There are two methods shown in Fig. 1 by which the stresses may be determined. We may either work directly from the weight W or from the reaction at the abutment A. It should here be particularly noted that the reaction R_1, although it is known at the abutment B, cannot be used at the present stage, because there are three bars—A B, C B, and D B—meeting at the point B, the stresses upon which are all unknown. It is, therefore, impossible to tell in what manner, and in what proportion, the reaction R_1 might affect any one of the three. For the sake of simplicity, make W = unity or one ton, from which a reference to the figure will point out that—

$$R = \frac{W \times 5}{20} = \frac{W}{4} = \tfrac{1}{4} \text{ ton.}$$

Similarly, we shall find—

$$R_1 = \frac{W \times 15}{20} = \frac{3\,W}{4} = \tfrac{3}{4} \text{ ton.}$$

It will be subsequently shown how the apparent difficulty attending the unknown values of the stresses on the three bars meeting at the point B could be got over, and R_1 used directly in determining the stresses; but, for the present, the methods demonstrated in Fig. 1 will be adhered to, and the direct action of the weight W first investigated. Make the dotted line D M equal one ton on any convenient scale. It is evident that this weight is transferred in the proper proportions to the supports by the bars or members C D and D B. From the point M draw M F and M L parallel to the two bars respectively, and F D and D L, and they will represent the stresses upon them. It is obvious, from the rule given in a former article, that as the direction of the weight W acts between the angle formed by the two bars themselves, they are both in compression. The stress F D on the bar C D, on arriving at the point C, will thrust against it, and induce stresses in the bars A C and C B, which tend to resist motion at that point. Make C *c* equal F D, and resolve C *c* into its components *c g* and C *g*, which will represent the stresses on the bars C B and A C. To find the nature of the stresses, produce C B to E, observe the direction of C *c*, and it will be seen that A C is in compression and C B in tension. Let it therefore be noted that in Fig. 1, with the load placed as shown, the bar C B will always be in tension. If C *g*, which is the stress on the bar A C, be made equal to A *b*, it is evident that when resolved into the two components A *a* and A *b*, these will represent the stresses on A B, and the support A. But the latter should equal—

$$R = \tfrac{1}{4} \text{ ton.}$$

If A *a* be measured on the same scale, it will be found to have this value, thus proving the accuracy of the operation.

Instead of using W, the working may be commenced by using the reaction R at the support A. The student and our younger readers will have no difficulty in following the various steps of this second method, so we shall do no more than draw attention to a few points in connection with it. The stress on A C when reaching the point C is made equal to C *d*, and resolved between the bars C B and C D, making the stresses *d f* and C *f* equal to *e g* and *c* C, which are the values already found for them. When the stress upon the bar C D arrives at D, it requires some attention, for at this point the weight W is situated. The direction and amount of this weight are known to make D K = C *f* = F D, and K L drawn parallel to D M will be equal to W, and D L = the stress on the bar A B. As the stresses on all the three bars are now known, we may select any two of them for working from. Take D B and C B, and make B N = D L equal to stress on D B, and B P = *c g* = *d f* = stress on C B, and draw P N. This last line is the resultant of the stresses on these bars, and if it be resolved into the two remaining stresses, it will give that on the tie-bar C B and that on the support B. If N O be drawn parallel to the vertical reaction at B, and O P parallel to A B, then we shall have O P = *a b* = stress already found for A B, and—

$$N\,O = R_1 = \tfrac{3}{4} \text{ ton.}$$

If the stress on B D were obtained as in the first instance, from the weight D, it might have been compounded with the known reaction R_1, and the resultant having been obtained, the stresses on the remaining two bars A B and C D readily deduced. By comparing the direction of the stress upon D B produced with the directions of the bars A B and C B similarly produced, it will be at once perceived that both the latter are in tension. In Fig. 2 is shown a diagram of forces, or stress diagram, in which the lengths of the lines similarly lettered as in Fig. 1 will be found to be equal to the lengths of the dotted lines representing the several stresses upon the different parts of the truss. They are in tons A B = 0·23, A C = 0·33, B D = 1·40, D C = 0·94, C B = 0·74. By commencing with the known direction of the reactions and following round the diagram of forces for each joint, the character of the stresses, whether tensile or compressive, can be determined, as explained when we were dealing with the subjects of stress diagrams and funicular polygons.

In Fig. 3 let the weight be placed at the point C, and let the amount and character of the separate stresses on the bars of the same truss be investigated under this new condition of loading. The value of the reaction will not be reversed, and we shall have—

$$R = \tfrac{3}{4} \text{ ton.} \quad R_1 = \tfrac{1}{4} \text{ ton.}$$

This case is clearly much simpler than that represented in Fig. 1, as two of the members become practically and theoretically redundant, and the parts of the truss undergoing stress are reduced to the three sides of a simple triangle. Commencing with W and following out exactly the same process as in the previous case, we obtain the stresses upon the bars A C, C B, B A, and the reaction A H = R on the support A. There are two points as to the arrangement of the loading, as shown in Fig. 3, on the truss which merit attention. One is that—as it is scarcely necessary to refer to except as affecting the bar C B as a counterbrace—the brace C B is now in compression. The other is that there are no stresses on the members C D and D B. It might have been not unreasonably supposed that as there are the same number of bars and forces acting at the support B in Fig. 3 as in Fig. one, they would all undergo some stress, although not necessarily of the same amount or character. But the reason why these two bars, C D and D B, are exempted from stress is easily explained. The resultant of the two stresses on the bars C B and A B is L M. If this resultant could be resolved into the two remaining stresses, one supposed on the bar D B, and the other in a vertical direction on the support B, there would be a stress on D B. But the line L M is the stress, or the reaction R_1 at B, which manifestly cannot be resolved in only one direction. If it were not that it is essential that every step in the determination of stresses should be thoroughly investigated and understood, the operation might be shortened as follows. From the point F, in Fig. 3, draw F N parallel to A B, then F N will represent the stress upon the tie-bar A B, and will divide the line C E into two reactions—

$$R = CE, \text{ and } R_1 = NE.$$

All the stresses are similarly lettered by corresponding lines of the same lengths in the reciprocal stress diagram in Fig. 4, which requires no further explanation. Summing up, the stresses by scale are in tons, A B = 0·67, A C = 1·00, C B = 0·73. From this summation it is evident that the amount of the stresses on the counterbrace C B is identical, and independent of the disposition of the load, but the character only is reversed.

As there is no ambiguity with respect to the direction or amount of the stresses upon the three bars meeting at the support B, those upon the different members of the truss may be checked by the method of sections. First, for the stress upon the bar A B, supposing a section made along the line VV_1. Take moments about point C, where the reaction at A = 0·75, and the leverage = 5. Put S for the stress on A B, and 5·5 for the leverage or arm, which is the distance C S, or the depth of the girder. Then we have—

$$S \times 5{\cdot}5 = R \times 5,$$

from which we obtain—

$$S = 0{\cdot}68 \text{ tons.}$$

Next, for the bar A C. Take moments round point S, and we have, by similar reasoning, putting C for the stress on A C—

$$C \times 3{\cdot}7 = R \times 5 = 1{\cdot}07 \text{ tons.}$$

Finally, for the counterbrace C B, putting C_1 for the compressive stress, we have, taking moments about S_1—

$$C_1 \times 1{\cdot}70 = 0{\cdot}25 \times 5 = 0{\cdot}73 \text{ tons.}$$

These stresses agree sufficiently near for all practical purposes with those already found by the other methods. The question of one or two more different arrangements of loading still remains to be considered.

PROPOSED FIREPROOFING TESTS IN NEW YORK.

A COMMITTEE of architects, engineers, and representatives of insurance companies in New York have arranged to make an extensive series of tests of fireproofing materials, on a scale comparable with the conditions which exist in the case of fires in actual buildings. Until now, all tests made have been undertaken in a more or less contracted manner, and, in most cases, simply to determine some special result. It is now proposed to carry out experiments on a large scale, and, among other things, to test the effect of an intense fire on the structural iron and steel so universally employed at the present time, and the effect that the different fireproofing materials may have in protecting the same. The committee has been jointly selected by the fire-insurance companies, the architects and the engineers, and consists of Mr. S. A. Reed, representing the Tariff Association of New York; Mr. George L. Heins, the Architectural League of New York; and Messrs. H. de B. Parsons and Thomas F. Rowland, jun., the American Society of Mechanical Engineers. It is satisfactory to learn that the manufacturers of fireproofing materials will not be allowed to subscribe towards the cost of the proposed experiments, but are asked simply to defray the expenses of erecting and removing their materials to be tested. The time of the members of the committee is freely given to the advancement of scientific knowledge, and their names are sufficient guarantees that thoroughly impartial tests will be adopted. The committee has organised, and has commenced to build the required plant at the Continental Iron Works, New York. There will be a gas-producer to supply the fuel-gas, so arranged to receive a spray of petroleum in case higher temperatures may be required than those obtained from the combustion of the gas alone. Furnaces for testing full-sized columns and floors will be erected. The foundations of these furnaces will consist of side walls with an arch between them, thus making a safe place for the introduction of the gas-pipes and for the hydraulic cylinder. On the top of this foundation will be erected a room built of the materials to be tested. The columns will be loaded by pressure from the hydraulic cylinder, and, during the tests, a safe load, such as is prescribed by the building laws of this city, will be put upon it. The arches for the floors will be loaded by dead weight. Every precaution will be taken by the committee to make the tests uniform as regards temperature, draught, cooling by water-streams, &c., so that the results may be comparable. The committee will take minute notes of all details and publish them, together with the results, in its final report. The committee would be pleased to communicate with anyone who may be interested in this matter. Its address is—The Committee on Fireproofing Tests, Room 104, 22, William-street, New York.

* * *

A stained-glass window, Early English in style, and representing the Four Evangelists and the Four Latin Doctors, has been placed in the south transept of St. Columb Church, Cornwall.

At the Auction Mart on Friday, Messrs. Fuller, Horsey, Sons, and Cassell offered a freehold property in the City of London, known as Botolph Wharf, situate on the Thames almost adjoining London Bridge. The ground area of the land is 15,023ft., which, with the buildings thereon, was knocked down for £52,050.

At the Shoreditch County Court, on Friday, before Judge French, Q.C., Charles Boswell, 17, recovered £60 damages from Messrs. Corder and Sons, sawmill proprietors, for the loss of two fingers, caused by defects in an overhand planing machine belonging to the defendants.

The district committee of the Mid-Lothian County Council have just replaced an old iron bridge over the river Esk at Polton by a new and heavier steel bridge. The old bridge was only closed for road traffic at noon on Saturday, and the old bridge was removed and the new bridge placed in position and riveted complete, the concreting and foundation of roadway finished, and the roadway opened for traffic within about 36 hours. Messrs. Alexander Findlay and Co., Motherwell, were the contractors for the steel work, which comprised two steel lattice girders, 54ft. span, weighing 5½ tons each; while the roadway, 16ft. wide, was formed by Messrs. Findlay and Co.'s special cambered steel troughing.

COMPETITIONS.

Liverpool.—The city council received, on Wednesday, a report from the Liverpool Museum and Arts Committee as to the proposed competition for the extension of the museum buildings in William Brown-street. The committee recommended that Mr. Aston Webb, V.P.R.I.B.A., London, be appointed assessor in connection with the competition for designs of the proposed extension, at a fee of 150 guineas. It was suggested that the competition should be a limited, and not an open, one. Consideration of the report was adjourned until Wednesday next, when it is probable that a discussion will be raised on the question whether the competition shall be restricted or thrown open to all comers.

Warrington.—In response to the request for sketches for shop-front, for Mr. S. Garland, ironmonger, Bridge-street, there were 24 drawings sent in. The generality of the competitors treated the subject in a very similar manner, and it was somewhat difficult to select the most suitable plan. After careful consideration as to which sketches were most suitable, and which satisfied the conditions of the competition, the first premium was awarded to a design by Mr. T. E. Hardy, 12, Aberdeen-place, Maida Vale, London, W.; the second premium to a design by Mr. Andrew Gray Bengeo, Hertford, Herts; and the third premium to a design by Mr. Chas. Kempson, C.E., A.R.I.B.A., Leicester; and cheques have been posted to these gentlemen.

CHIPS.

Two lights in the north choir aisle of Truro Cathedral have just been filled with stained glass. One contains the figures of St. Athanasius, St. Basil, and St. Chrysostom, and below a scene from the history of the first-named father of the Church, his triumphant entry into the city of Alexandria after his return from exile. The other light contains the figures of the Empress Helena, Origen, and St. Jerome. Below is given the scene of the discovery of the true Cross at Jerusalem by Helena, commemorated in the Calendar on May 3rd.

A Bill has been introduced, and will be passed without opposition, for the purchase of the block of buildings between Parliament-street and King-street, Westminster. The amount asked is £450,000.

The islands opposite the city front at Philadelphia, so long a restriction upon the commerce of the port, have been removed by the United States Government, after the appropriations of millions in money and three years of work. Work upon the site of the islands will be continued until a depth of 32ft. at high water is obtained. As a result of the removal of the islands, new piers, ranging from 600ft. to 1,000ft. in length, are being constructed, which will afford greatly increased room for vessels directly on the city front. The Federal Government has continued the work of deepening the channel of the Delaware River, the intention being to secure a depth of 32ft. at high water and a width of 600ft. to the sea.

The parks and galleries committee of the Glasgow Corporation have recommended to the town council that a grant of £5,000 be made to the building fund of the new School of Art. By such a grant the directors would be enabled to secure an additional gift from the Bellahouston Trustees, and the grant will also relieve the town council of future obligations to the school.

An addition to Winchester College, the gift of Dr. Freshfield, is now nearly completed. Fromond's Chantry, the chapel used by the junior scholars, is enriched by a reredos of cedar-wood exquisitely carved, and an altar of Purbeck marble, having on its face an inlaid porphyry Byzantine cross, copied from one in the Mosque of Ste. Sophia at Constantinople. There are corner crosses copied from the corner stones of the Golden Gate, and of the Order of St. John of Jerusalem, of which Dr. Freshfield is a member. Mr. J. Oldrid Scott, F.S.A., of Spring-gardens, S.W., is the architect.

At St. Bartholomew's Hospital on Friday, Mr. Langham held an inquest respecting the death of James White, 52, a builder's labourer, of Wells-road, Upper Sydenham. On August 16 the deceased was working at the newly-erected building in Southampton-buildings, Chancery-lane, for the Birkbeck Bank. A "skip" was being used to lower concrete into the basement, and while being drawn up empty it caught underneath a plank and dislodged it, and the plank fell endways on the man's head. He was removed to the hospital, where he succumbed to a fracture of the skull and other injuries. Witnesses were of opinion that the accident was unavoidable. The jury returned a verdict of accidental death, and expressed the opinion that the plank ought to have been securely fixed.

Engineering Notes.

◆

EDINBURGH.—Good progress is being made with the work of demolishing the old North Bridge, and of laying the foundations of the structure which is to take its place. Mr. Blyth, C.E, of Edinburgh, is the engineer. The contractors, Messrs. William Beattie and Sons, Fountainbridge, Edinburgh, began in April last, and already nearly the east half of the bridge has been taken down, save the central arch, while simultaneously those parts of the two buttresses of the new bridge which can be got at are well under way; the south pier foundation is up to the rail level, and the north pier foundation is about half finished. The arches, before being touched, were centred with heavy timber. Half-a-dozen cranes of various sizes and styles are in use to lift the material from one stage to another, for about 6,000c.ft. of stone have to be dealt with in taking down the bridge, besides 500 tons of iron, which were placed in position when the bridge was widened 20 years ago. The ashlar stone of the old bridge, which was erected in 1772, as it is taken down, is sent to a shed on the rail level to be cleaned, and it will be utilised in connection with internal work in the new piers. The rubble is sent to a stone crusher to be broken up for use in the concrete beds which constitute the foundations of the piers of the new bridge. The rubbish is shot down spouts into waggons beneath. Nothing of noteworthy kind has been got so far in connection with the demolition, save a few moulded stones from the rubble work, which are supposed to belong to Old Trinity College Church. As to the new bridge, in excavating for its foundations the contractors have gone down about 40ft. below the rail level—28ft. of that being through made-up ground. The south pier, extending from east to west, measures 100ft., and has a breadth of 22ft. 6in. Right round this area were driven a series of pitch-pine piles, 12in. by 6in.; then the soil was excavated to a depth of 40ft. There hard boulder clay was reached, and upon this the pier is founded. The whole of the interior was then filled with a solid mass of concrete—there being 4,000 tons of concrete in the base of this pier. Three feet below the rail level the contractors began to use a facing of stone, and the pier from this point up to the street level will be of solid brick, set in Roman cement and faced with ashlar cubes. The abutments go down 50ft. below the ground, or 12ft. deeper than those of the old bridge, and measure from back to front 33ft. They are of rubble work, faced with ashlar. About 150 men are at present engaged upon the work.

◆

By an Act passed by the Legislature of the State of Ohio a clay-workers' school has been established at the Ohio State University, where the chemistry, mechanism, and manual work of everything connected with clay industries is taught. Professor Orton is the director of this school.

Greater Southampton will become an accomplished fact within a few days, the opposition to the provisional order extending the boundaries of the borough of Southampton, threatened by the Shirley and Freemantle district board, having been withdrawn. The provisional order only awaits the Royal Assent to come into operation.

The De Lank granite works, which have been closed for nearly two years, were reopened last week under new auspices. The Eddystone Granite Company, since their formation in 1889, have done much to develop these quarries, having opened out extensive beds of rock which have produced unusually large and fine blocks of fine granite. The company was selected by Mr. Wolfe Barry, C.B., and the contractors of the Tower Bridge to supply the granite for the greater part of that erection. Machinery of the most modern type has now been erected under the supervision of Mr. W. H. Stanger, C.E., of Westminster, the whole being worked by a 200H.P. turbine driven by water from the De Lank river.

At the town hall, Colne, on Friday, a Local Government Board inquiry was held by Mr. Clerke into an application by the Colne District Council for sanction to borrow £3,000 for purposes of sewage disposal. The clerk to the council said the council had already expended about £50,000 on the sewage farm. The area of the farm was 25 acres. The system of sewerage was downward intermittent filtration. There were six tanks at present in use, and by the proposed alteration there would be eight tanks. There were from six to eight miles of private street sewers in the town, in addition to the main sewers, and 150 streets were now being connected with the main sewers.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

ARCHITECTURAL ASSOCIATION.—The session for 1895-6 of the Association will be opened on Friday, Oct. 11, when the president, Mr. W. D. Caröe, F.R.I.B.A., will deliver his inaugural address. The subsequent meetings, all held on alternate Friday evenings at 7.30, in the R.I.B.A. meeting-hall, 9, Conduit-street, W., are as follows:—

Nov. 8.—"Pompeii" (with lantern illustrations). Mr. Talfourd Ely, M.A.
„ 22.—"The Municipal Control of Buildings." Dr. G. B. Longstaff, L.C.C.
Dec. 6.—"Scenic Art." Professor Herkomer, R.A.
„ 20. { "Brickwork." "Leadwork." Mr. C. Hill. "Woodwork." Mr. R. Rust.
1896.
Jan. 10.—"Municipal Buildings." Mr. Henry T. Hare.
„ 24.—"Copper." Mr. Nelson Dawson.
Feb. 7.—"Technical Institutes." Mr. Sidney H. Wells.
„ 21.—"The Modern Stencil." Mr. Arthur Silver.
Mar. 6.—"Masonry" (Practical Stonework). Mr. Hervey Flint.
„ 20.—"The Architecture of the Teutonic Order, with Particular Reference to the Restoration of the Marienburg." Mr. C. Fitzroy Doll.
April 24.—"The Present Position of Architecture at the Royal Academy." Mr. Francis E. Masey.
May 8.—"Fabrics." Mr. Aldam Heaton.

THE SOCIETY OF ARCHITECTS.—The anniversary meeting of the Society of Architects will be held at St. James's Hall, Piccadilly, S.W., on Tuesday, October 29th. The recently-published list of members shows a steady increase in numbers. The roll now contains 486 ordinary members, 18 honorary members, and 9 associates, a total of 513 names in the three classes, whereas at the corresponding period last year the numbers in the three classes were 453, 16, and 8 respectively—in all 477.

◆

CHIPS.

At a meeting held at Worcester last week it was decided that the services of the ex-mayor, Mr. G. H. Williamson, to the city should be commemorated by a portrait to be painted by Mr. Hacker, A.R.A., and to be hung in the city Guildhall.

A new public clock, manufactured by Messrs. W. Potts and Sons, of Leeds, is about to be placed in the lantern tower of St. Nicholas's Cathedral, Newcastle-on-Tyne. The clock is the largest in the United Kingdom, with the exception of the one on the Houses of Parliament. The cost, £650, in addition to £80 for new dials, has been borne by the city council of Newcastle. When the new clock is fixed, the old one will be transferred to All Saints' Church tower in the same city.

The fair and markets committee of the town council of Stamford have received tenders for the making of a new cattle market. The tenders range in price from £7,470 down to £5,530, and the committee have unanimously decided to recommend the council to accept the lowest tender, that of Mr. John Woolston, of Stamford. The committee estimate that the total cost of the market, exclusive of one of Ive's precipitating tanks, will be £7,283 19s.

A portrait of the Bishop of London, by Professor Herkomer, R.A., subscribed for by the clergy and laity of the diocese, is to be painted at a cost of £750, and then permanently placed with the portraits of past bishops in Fulham Palace.

The foundation-stone of a mission church was laid in Head-street, Pershore, on Friday. The hall will measure 50ft. by 24ft. exclusive of apse and classroom. Mr. W. Lunn, of Malvern, is the architect, and Messrs. Nicholas Brothers, of Pershore, are the contractors.

Memorial-stones of new Primitive Methodist Sunday schools were laid in Hewitt-street, Lostock Graham, Cheshire, last week. Mr. Robert Woodier is the contractor.

The town council of Shrewsbury have decided to purchase Monkmoor Farm, consisting of 172½ acres, with the residence, buildings, and three cottages upon it, for £22,500, as a sewage farm.

The Burt Memorial Hall, at Newcastle-on-Tyne, the headquarters of the Northumberland Miners' Association, has just been completed. The building, which has cost £7,000, has been erected from designs by Mr. J. W. Dyson, Grainger-street, Newcastle.

Mr. E. C. W. Prouse, a railway engineer, was measuring a large stone on a crane at Westbury when the jib of the crane broke, fell on him, and instantly killed him.

The three small pictures lent to the National Gallery by Mr. George Southey, and hung in the central octagon hall on Wednesday in last week, are "A Portrait of a Man," by Bartholomaus Bruyn; "Portrait of Costanza de Medici," by Domenico del Ghirlandajo; and a "Virgin and Child," attributed to Dierick Bouts.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—B. Lumley.—A Reader.—N. C. and Co.—L. W. (Rochester).—E. T. M.—S. D. and Co.

◆

Correspondence.

LYNN MUNICIPAL BUILDINGS.

To the Editor of the BUILDING NEWS.

SIR,—I have pleasure in answering the letter by Mr. Silcock, a gentleman from whom I received much courtesy when at Lynn obtaining particulars for the competition. By his letter the case appears in a nutshell, and I shall perhaps seem pig-headed if I still hold to my opinions, though I certainly would not withhold my apologies to Messrs. Tree and Price if I felt they were clearly entitled to them; but it would be premature to offer them at present. Before doing so I require to know the following:—1st. That all the accommodation asked for has been substantially provided. 2nd. When the final account has been sent in that the stipulated price has not been exceeded; and last, but not least, that all the costly, elaborate, and richly-moulded and ornamental stonework, so clearly expressed in the perspective, has been carried out in a substantial manner, and that the interior is, at least, a little in keeping with it.

But whatever Messrs. Tree and Price may accomplish, I still maintain that the large amount spent in an elaborate front is out of all proportion to the total sum to be spent on the building. That this ornate design of "It Speaks for Itself" "caught on" with the assessors is clearly proved by looking at Mr. Sedger's design (I only mention his on account of it being placed second; Mr. Sedger is a perfect stranger to me). In this design the plan is distinctly the best; by keeping to a more simple front, more money has been spared for the plan. In short, the appearance of Messrs. Tree and Price's design is quite inconsistent with the cost of the whole building. It has all the appearance of "money is no object," when the contrary was the case, according to conditions.—I am, &c., One Disgusted.

"IS A CONTRACTOR DESIRABLE?"

Sir,—The writer of the interesting article in last Friday's issue of your admirable journal on this subject scarcely refers to the fact that contractors and builders are every year more and more developing into mere factors, scarcely doing any of the work by their own men, and taking often large profits for doing precious little, while the sub-contractors have to execute the work and take all risks at a very narrow margin of profit indeed. A vast quantity of stonework is now wrought at the quarries, and so brought on to the jobs ready for the fixer; the brickwork is sublet more than often; the iron work nearly always is, of course, or if special makes are specified, the builder demands his 10 to 15 per cent. for actually doing nothing. The joiners' work more than often comes from Sweden; and as for working mouldings, even where the contractors retain their joiners' shops, we all know that foreign machine-made mouldings are bought by the mile. The rage for cheapness has much to answer for in this respect, and scamping work, of course, is the practical outcome obtained by the public not by any means infrequently, and architects find themselves meanwhile acting the part of technical policemen—"a life which is not a happy one." Boys are not put to the building trades as they used to be, and the problem of obtaining really skilled artificers is therefore exceedingly difficult, while the master builders becoming thus mere factors, all interest in good work is gradually and surely being lost.—I am, &c.,

An Old Tee-Square.

WAR DEPARTMENT SURVEYORS.

Sir,—To afford "Prospect" the information he seeks, "Traveller's" letter must be supplemented by explaining that had the assistant surveyor alluded to been allowed to complete the designs for the barracks at Malta, and had a satisfactory building resulted, it would have been triumphantly pointed to as the work of Royal Engineer officers when next their capacities as architects had been called in question.

The "assistant surveyor" is not invited to join the service of the War Office as architect or civil engineer to the War Department, but he is constantly employed in either or both of these capacities. His failures in them are duly scored against him when they occur, but his successes are systematically appropriated by the Royal Engineers.

As regards travelling, surveyors must, of course, travel at the public expense; the concession recently made to them allows them in addition to recover the actual railway and steamer fares of a wife and family.

For moving himself and family from Cork to Dover, or from Edinburgh to Plymouth, he would be allowed the cost of the direct railway and steamboat tickets with a limited weight of baggage and a small personal allowance *for himself only* (both based on military requirements). That neither of these journeys would ever be undertaken without a break; that wife and family must carry luggage as well as himself; that the expenses of moving household furniture and effects are considerable—are facts ignored by the War Office, although they may have to be met by the assistant surveyor once in every two or three years.

Compare the Admiralty service, in which C.E.'s are allowed all actual expenses necessarily incurred (hotel and other bills being accepted as vouchers), and a fair compensation is even allowed for such items as alterations required to carpets, &c., in moving from one house to another!

Since the correspondence in your columns in 1893, surveyors have been graciously permitted to affix to their names in the Army List and other publications such professional or university degrees as they may possess; but I have not heard of any other concessions to which "Prospect" can be alluding.

Certainly within the last two or three years the lack of training of Royal Engineers as architects and civil engineers has been very fully exposed in the professional journals, both military and civil. So if "Prospect" is of a speculative turn, and very hard up for employment, he may think it worth while to enter the War Department on the chance that "the new brooms" at the War Office may "sweep clean," rid the British taxpayer of all amateur architects and civil engineers at present in War Office employment, and give fair scope and adequate rewards to qualified professional men in their stead.—I am, &c.,

Verb Sap.

CHIPS.

The Barrett-Browning clock tower and institute, just erected at Ledbury, was formally handed over to the committee by the builder (Mr. George Hill) on Saturday.

Steady progress is being made with the works of drainage in course of execution in the Midlands for the Upper Stour Valley Main Sewerage Board. The engineers are Messrs. E. B. Martin and W. J. Fiddian, of Birmingham, and the contract for the supply of cast-iron pipes is being carried out by Messrs. Cochrane and Co., of Dudley.

A vocalion organ, the gift of Lord Tollemache, has just been placed in the parish church of Helmingham, Suffolk. The case is of Gothic design, and executed in carved oak. Messrs. Hill and Sons, of London, were the builders.

The Master Builders' Association of Bristol have made a protest against the acceptance of a tender for new board schools at Weston-super-Mare, as, though applications were invited from builders in the Bristol newspapers, the tender of Messrs. R. Wilkins and Son at £9,949, and Mr. G. H. Wilkins at £9,840, both contractors of that city, were below the tender accepted by the board, the amount of which was £10,291.

Some 500 members of the Manchester district of the Association of Operative Plasterers visited Chester on Saturday. They were accompanied by the Ashton Mills Brass Band, and marched in procession from the Northgate Station to the Roodee, where foot races were held. The annual dinner was afterwards held in the Temperance Hall, under the presidency of Mr. M. Dellar. A letter of welcome from the Cheshire Trades Council was received at the dinner.

An important addition to the facilities of the port of Southampton has just been completed in the south extension quay of the new sea wall. At this quay two of the largest vessels sailing from the port can be accommodated, and being a deep-water berth, ships of the greatest draught can approach or leave at any state of the tide.

A course of twelve Swiney lectures on "The Geological History of Man" will be delivered by J. G. Garson, M.D., V.P. Anthrop. Inst., in the lecture-theatre of the South Kensington Museum, on Mondays, Wednesdays, and Fridays, at 5 p.m., beginning Friday, 4th October, and ending Wednesday, 30th October. Each lecture will be illustrated by lantern-slides and limelight. Admission to the course is free.

The London and North-Western Railway Company having decided to construct a new station at Prestatyn, a rapidly-growing watering-place on the North Wales Coast, have let the contract for the work to a Liverpool firm, and work will be commenced almost immediately. The existing station is out of date, and inconvenient.

The election of officers and committee of the A.A. Camera Club, which took place at a recent general meeting, resulted as follows:—President, E. W. M. Wonnacott; vice-president, R. Elsey Smith; committee, J. P. Clark, Geo. Fleetwood, Matt. Garbutt, and A. J. Roddis; hon. secretary, Francis R. Taylor; hon. treasurer, C. H. Freeman.

After a long and painful illness Mr. William Clark, who was for many years surveyor to the Kingswood highway board, died at his residence at New Cheltenham on Saturday. Mr. Clark was 80 years of age.

On Saturday afternoon a new technical institute, which has been built at a cost of between £4,000 and £5,000, was opened at Runcorn by Sir John Brunner, M.P., the principal donor.

Mr. W. J. Bird Clerke, C.E., held an inquiry at the Salford Town Hall on Friday on behalf of the Local Government Board, with reference to an application of the Salford corporation to borrow £18,000 for the purposes of electric lighting in the borough. The town clerk stated that some time ago an application was made to the Local Government Board for power to borrow £50,000 for electric lighting, but £32,000 only was sanctioned, and the present inquiry related to the balance of that amount. Mr. Edward Manville, the engineer appointed for carrying out the electrical lighting in the borough, explained the details of the scheme, and observed that the works had been carried out in accordance with the plans originally submitted to the Local Government Board. The extensions were outside the compulsory area.

The construction of the section of the Central Siberian line between the town of Tomsk and the station of Tomsk-Taiezhni has just been taken in hand. Exile labour is being used for the embankment works.

Intercommunication.

QUESTIONS.

[11411.]—**House Sump.**—I have plans to prepare for villa on a plot of land which falls from back to front; there are no sewers in the village, and the house sewage will be drained into a sump that cannot be placed any further away from the house, than, say, 15 yards, and the only position available is near the entrance gates. Will any of your readers be good enough to describe the best construction for such a sump, disconnection of drainage, and ventilation?—Arran.

[11412.]—**Varnished Wood Ceiling.**—Some years ago I put up as above, but from gas and repeated varnishing it has now got to be very dark in colour, and giving no reflected light. Can any kind reader give me his opinion, as to what I could do to recover my lost light, and in the most effective and inexpensive manner? The ceiling is about 40 squares.—G. B. D.

[11413.]—**Geometrical Projection Drawings.**—Would any of your kind readers inform me as to where I can get a treatise on the above subject? Any information as to the principles on which the above subject is worked would be most acceptable.—Student.

[11414.]—**Stains in Stone.**—In a cream-coloured stone which I use there are reddish stains, also veins and spots of a deep brown—iron, apparently—which run in wet weather. Is there any chemical which will bleach out these defects, so as to bring them to match the rest of the stone, or even reduce the strong contrast between the parts. I do not wish to use paint if it can possibly be avoided.—Z.

[11415.]—**House Linings.**—Some time ago I read of an American thin, smooth-surfaced material for casing the interiors of houses if in an exposed situation, composed of rolled, pressed, glazed paper, upon a very thin slice of wood, ⅛in. altogether. Can any reader give me particulars of this, or any similar material?—Damp.

[11416.]—**Civil Engineering.**—Will some reader kindly give me the names of a few of the best works for the study of civil engineering?—W. H. H.

REPLIES.

[11398.]—**House Drains.**—Sir Robert Rawlinson, chief engineering inspector of the Local Government Board, states in his "Suggestions as to the Preparation of Plans for Sewerage," "The sewers should be at such depth as will effectively drain house-basements, and, when practicable, not less than twice the full diameter of the sewer below basement or cellar floors, to prevent house drains from being back-watered. Drains from basements to sewer should have a clear fall of not less than 1 in 60, and should enter sewer by a junction specially provided for the purpose." In many districts in London the levels of cellar floors do not give the requisite fall for house drains, and as a consequence, when a heavy rainfall happens, they are rendered inoperative, and the backwater forces its way into the basement. For falls and size of house drains, "A. B. M." had better consult Neville's Tables. A 4in. drain flowing half-full requires an inclination of 1 in 60, and a 6in. drain a fall of 1 in 85.—Civil Engineer.

[11399.]—**Rolled Joist.**—The formula I gave from Hurst is for rolled joists with top-flange only, and ought to have been so stated. "X." is quite right as to 7 being the constant for rolled joists of I-section, which is the most usual form. These, the same authority says, are about one-sixth stronger than single-plate girders.—G. H. G.

[11403.]—**Estate Management.**—In reply to the query of "Z. Y. X.," asking for the names of books which treat of the laying out of building estates, &c., I bought a book called "The Practical Directory for the Improvement of Landed Property," by R. Scott Burn. This can be obtained from a second-hand book-store situated in a narrow alley leading from Lincoln's Inn-fields to Holborn, London, but I have forgotten the name and the exact place.—No Sig.

[11408.]—**Church Screens.**—"Remains of Ecclesiastical Woodwork," by the late T. Talbot Bury, architect, F.R.I.B.A., and published in 1847, contains illustrations and sections of oak screens, Early English, Decorated, and Perpendicular. The work is a most excellent one, and can, I believe, be obtained at Batsford's, 52, High Holborn, W.C., at considerably less than the original price.—Harry Hems.

The President of the Local Government Board has ordered an official inquiry to be held into the recent failure of supply by the East London Water Works Company, and the means to be adopted to prevent the recurrence of any deficiency.

On Wednesday week, Colonel W. Langton Coke, on behalf of the Local Government Board, conducted an inquiry at Wednesbury with reference to an application by the town council for sanction to a loan of £7,500 for addition to the sewerage and sewage disposal works to meet objections to the effluent passed into the Tame from the works.

Members of the English Arboricultural Society held their eleventh annual excursion at Kelso last week. Numbering fully 70, the party arrived on Wednesday afternoon, August 28, and the annual meeting was held in the Cross Keys Hotel in the evening, the chairman being Mr. Maughan, Jervaux Abbey. On the following day the excursionists drove to Mertoun, Dryburgh, Bemersyde, and Abbotsford; and on their return they dined together. The visit was brought to a close on Friday, the programme including a drive to the finely-wooded estates of Springwood, Hendersyde, Floors, Newton Don, and Stichill.

Legal.

SUBTERRANEAN WATER.

THERE can be no legal property in percolating water. There are rights to a flow of water, and, of course, to water which is collected upon land, and so reduced into possession; but while the water is actually percolating through the soil, it seems to belong to nobody in particular. This point was well brought out by the House of Lords in a case affecting the Borough of Bradford as a water company (*Times*, July 21st). The corporation had taken over the Bradford Waterworks, and with it the springs called "Many Wells," which were part of their sources of supply. The owner of a farm on higher ground adjoining the lands through which the water ran to make these wells had lately decided to work the minerals beneath his land, and to do this economically he was about to make a drift or tunnel, so as to keep his mines clear of water without going to the expense of constantly using pumping engines. But it appeared that if he did this the effect would be to cut off the underground stream of water which supplied these "Many Wells," and so to reduce the supply of the Bradford Corporation. To this they objected, and brought their action to restrain making the proposed drift or tunnel, on the ground that it was an infringement of their rights in these springs or wells.

Although Mr. Justice North had granted the injunction asked by the Corporation, his decision was reversed by the Court of Appeal, whose ruling has now been confirmed by the House of Lords. Strictly put, the point decided came to this. The Act in question prohibited the taking water which belonged to the company; but it, of course, did not prohibit the taking of what was not theirs. The defendant, therefore, could not be prevented from draining his own mine simply because the effect of doing so would be to cut off the water from these wells: because, while it was percolating, the water did not belong to anybody. The result is that the defendant succeeded, and if the corporation wish to stop this cutting off of subterranean water, they will have to purchase his land—minerals and all—which is, after all, only what other trading companies often have to do in order to protect their own rights of property of this description.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Architect. — Drawings. — Remuneration, &c. — (1) This would depend on the conditions of the competition. (2 and 3) There is no rule of law, nor any legally binding custom; but about half the commission should be charged.

Constant Reader. — Plans. — Payment. — The vicar and the charity committee would seem to be responsible for some remuneration.

Work.—Cottager.—Wall.—B. as a private owner would have no legal right to underpin A.'s wall without his consent.

* * *

The Bishop of Chichester visited Bognor on Thursday in last week, and dedicated a new church tower and a peal of bells.

The Queen will lay the foundation-stone of the New Mar Lodge next month. The Queen, it is stated, takes much interest in Mr. Mackenzie's plans, and in details of the materials to be used in building. The Duke is putting as much of the work as possible in the hands of local men and those whom they employ. It is expected that the New Mar Lodge will be finished by the end of 1896.

A mission-room in Oak-road, Northam, near Southampton, has been enlarged, raised in height, provided with a chancel, and was reopened on Wednesday week as a church for the deaf and dumb. The old plain square windows have given way to traceried lights. A dado has been run round the church, and a wood-block floor laid down. The chancel floor, steps, and also the other fittings are of oak. There are three stained-glass windows in the chancel, the centre one containing a representation of Christ healing the sick. In the side windows are figures of St. Mary and St. John. The chancel is a memorial to the late Mr. R. S. Pearce, late town clerk of Southampton, who died December 28, 1893. The architect for the new building was Mr. J. E. Batchelor, of Salisbury, and the builder, Mr. H. J. Kite, of the same city. The building will accommodate a congregation of about 100, and the alterations have cost about £500.

LEGAL INTELLIGENCE.

Wooden Shop on Wheels and the Building Act.—At Lambeth Police-court on Saturday, Mr. Joshua Keevil, of the Brixton Granaries, Stockwell-road, was summoned before Mr. Hopkins by the London County Council for unlawfully setting up a wooden structure without having first obtained for that purpose a license from the London County Council. The proceedings were taken under the 84th section of the London Building Act, 1894. Mr. Thomas Chilvers, of the Solicitor's department of the Council, appeared in support of the summons, and Mr. R. A. Kinsbury defended. Mr. Chilvers said the defendant was a corn-merchant, carrying on business in the Stockwell-road, and until June 24 of this year he carried on business at No. 246 in that road. He then disposed of those premises to Cooper's Stores, and between that date and June 29 he erected a wooden shop on wheels on an adjoining piece of land. At the rear there was a covered way and the defendant could either wheel the structure under it or keep it level with the pavement as he pleased. The structure was composed of wood, and was fitted up as a shop. The Council drew the defendant's attention to the matter, and served a notice upon him. To the latter no reply was received, and this summons was issued. Mr. G. S. Turner, a surveyor of the London County Council, stated that on June 2 he received a letter of complaint as to the structure in question. He afterwards made a survey and found that the place was used as a shop for the sale of corn, grain, and seeds. The building was entirely constructed of wood, but was covered externally with corrugated iron. It was 9ft. 9½in. in width, 12ft. 9in. in depth, and 11ft. in length. There was a counter in the middle, and the front was composed of a shop-window and doorway. It stood about 2ft. from the pavement, and was lighted by gas. The consent of the Council had not been obtained to the setting up of the structure. Mr. Parsons, the district surveyor, called for the defence, said the defendant called on him with reference to the structure, and he came to the conclusion that the building was not one that had anything to do with him as district surveyor. Mr. Hopkins adjourned the case until October 8, in order to give the defendant an opportunity of coming to an arrangement with the Council.

In Re Joseph Bates.—At the sitting of the St. Alban's Bankruptcy Court, held on Friday, the public examination took place of Joseph Bates, builder, of Chorley Wood. The summary of affairs showed gross liabilities £3,824 18s. 7d., and amount expected to rank for dividend £2,837 6s. 3d. The estimated assets showed £624 16s. 7d. which, after deducting £35 15s. 10d. for rent and taxes, left a deficiency of £2,248 5s. 6d. The report of the Official Receiver stated that in 1869 the debtor took to the business until then carried on by his father. The value of the business was about £50; he had no capital of his own; since then he has continued to trade as a builder and carpenter, in his own name. The examination was adjourned until Sept. 17.

Morden College v. Lethbridge and Prior.—This was an action before the Official Referee, Mr. Very, for dilapidations on property leased by Morden College, which lease expired Michaelmas, 1888. The claim was for £2,000. The defendants paid £300 into court, which they pleaded was sufficient to cover the dilapidations existing at Michaelmas, 1888, having regard to the repairing covenant having the words "the reasonable use and wearing" limiting its force, and also taking into account the class and construction of the houses. The hearings were on June 20, 21, 22, 24, and 25, and July 22 and 23 last. Mr. Gore Brown, instructed by Messrs. Reyroux, Phillips, and Co., appeared for Morden College. Messrs. Barnes, Williams, and Lawton R. Ford were the surveyors supporting the claim. Mr. Reginald Bray and Mr. Bartley Dennis, instructed by Messrs. Lethbridge and Prior, appeared for the defendants. Professor Banister Fletcher, Mr. H. Phillips Fletcher, and Mr. C. Jones were the surveyors giving evidence for the defendants. The referee has now given judgment for the defendants with costs.

* * *

The Cotham Wesleyan Chapel, Redland-road, Bristol, which has been closed for renovation, was reopened on Sunday. The work of improvement and decoration has been carried out by Messrs. Thomas and Son, of the Triangle, Clifton, under the direction of Mr. Herbert J. Jones, M.S.A., architect, Wellington-chambers, Bridge-street, Bristol.

The War Office has decided to largely extend the Military Hospital at Stoke, near Plymouth. Four new blocks, having accommodation for one hundred patients each, and further official residences and quarters for married members of the medical staff, are to be erected, at a cost of about £40,000. The authorities are in negotiation with the Ecclesiastical Commissioners for the purchase of a site of about four acres, which is at present glebe land, and for which the Commissioners ask £12,000.

WATER SUPPLY AND SANITARY MATTERS.

Edinburgh.—The Streets and Buildings Committee of Edinburgh Town Council took an important step on Friday in the scheme for covering-in the Broughton Burn, which, in one form or another, has been before the corporation for many years. The committee proceeded to open estimates which had been received, and resolved to recommend one amounting to £6,000. The work is to be done under the supervision of the burgh engineer. The portion of the Broughton Burn which remains to be covered in extends from the rear of the Catholic Apostolic Church at the foot of Broughton-street as far as a point near the North Leith branch of the North British Railway Company, in the vicinity of Powderhall Station. Part of the contract is also to cover in the Gayfield Burn, so far as it runs open, from near the foot of Annandale-street to a point at the north-east corner of the grounds of Gayfield House, where it will join the Broughton Burn sewer. The new main sewer, which will finally effect a junction with the Water of Leith sewer, will follow the line of a proposed new street from Blandfield Meadows to Bellevue, whilst the Gayfield branch sewer will follow the course of a proposed new street in line of Annandale-street. The sewers will be egg-shaped, measuring 3ft. by 4ft. 6in. and 2ft. 8in. by 4ft. respectively, and they will be constructed of 9in. brickwork set in cement, with stone sills. With the exception of a few hundred yards of the Figgate Burn which still remain uncovered from beyond the London-road as far as the municipal boundary, the works now estimated for will cover-in the last of the open sewers within the city bounds.

Morley, West Riding.—The corporation of Morley received on Monday a report from Mr. Charles Gott, C E, of Bradford, announcing the completion of the contract for the waterworks at Withens Clough. The total cost of the whole of the works of the reservoir and north and south conduits was £49,820, of which amount £47,700 had already been paid, leaving the final balance now due, for which a final certificate was inclosed. He had dealt with the whole of the claims of the contractors, and considered that the settlement was in every way satisfactory. His original estimate for these works was £45,903, and the excess of expenditure was £3,917, which covered the additional cost of the removal of the peat, the wing puddle trenches, the pitching of inner slopes, and all extra works. The reservoir has a capacity of 30,000,000 gallons larger than the original design, which was more than equal to the value of the additional outlay.

Shrewsbury.—The property-owners and ratepayers in the borough have received a voting paper as to the advisability of adopting a new water scheme. The paper explains that the present supply of water from the river is most objectionable; that the new intake will be further up the river—at Shelton—and that a pumping station, subsiding-tanks, and filter-beds will be provided within the borough boundary. The service reservoir will be near Hamond Railway Station, and 108ft. above the highest ground-level in the borough. The water will be as pure as that of any river supply in England. The probable cost will be about £48,000, and will entail an increased rate of 1¼d. in the pound.

CHIPS.

The exhibition which the directors of the Grafton Galleries propose to hold in May next will have to do with the drama and the stage. The walls will be hung with portraits of actors and actresses past and present, and with pictures of dramatic subjects. The cases will contain theatrical properties, curiosities, and objects of interest, and a certain amount of space will be given to playbills.

It was announced on Saturday that the anonymous donor who has contributed about £7,000 for the restoration of the old parish church tower and clerestories at Kidderminster is Mr. John Brinton, formerly M.P. for the borough. The work is practically completed, and arrangements are being made for a dedication service on October 31.

The great scheme of alterations and improvements at Bamburgh Castle instituted by the new proprietor, Lord Armstrong, is progressing satisfactorily. As many as 120 workmen are engaged upon the work, which is personally superintended by Lord Armstrong himself.

The foundation-stone of the extension to the infants' department of the National Schools of St. James's Parish, Haydock, near St. Helen's, was laid by Lord Newton on Saturday afternoon. At present the infants' school provides accommodation for 150 children, and by an expenditure of £160 the seating capacity of the building will be increased so as to find room for 220 scholars. The alterations are being carried out from plans prepared by Mr. T. Robinson, of Haydock, the contractors being Messrs. Mercer, of Haydock.

Our Office Table.

Several of the principal provincial art galleries opened their autumn exhibitions on Monday morning, and, as usual, most of the leading pictures of the year are rehung at one or other of these institutions. The pioneer of these municipal art exhibitions in the provinces is the Walker Gallery at Liverpool, which this year celebrates its twenty-fifth anniversary with a display of canvases of special excellence. In the central positions of the principal room Millais's too dramatic "Speak, Speak!" is hung *vis-à-vis* to Leighton's "'Twixt Hope and Fear," a study of a girl. Other noteworthy exhibits, including G. F. Watts's "Outcast Goodwill," the late Henry Moore's last landscape, "Glen Orchy"; Ralph Peacock's woman with flying drapery bearing the uncomplimentary legend from the Persian, "A rose, a lily, a dove, a serpent, a little honey, and a handful of clay"; Frank Dicksee's "Reverie" (which has been purchased for the permanent collection by the Liverpool Corporation), Henrietta Rae's "Apollo and Daphne," Solomon J. Solomon's "Echo and Narcissus," Shannon's portrait of "Joseph Hoffman," and Melton Fisher's interior of a draper's shop, entitled "Vanity Fair," may be particularised.

The show at the Manchester City Art Gallery, the thirteenth of its class, is scarcely equal to the average display in that city. Leighton is represented by two figure subjects, G. F. Watts by his "Charity" from the New Gallery, and Millais by "St. Stephen," "Time the Reaper," and "The Empty Cage," James McWhirter by his "Austrian Tyrol," one of the works purchased by the Chantrey trustees, Briton Riviere by his "Phœbus." The best landscapes are by H. W. B. Davis, Alfred Parsons, Alfred East, David Murray; the chief portraits by J. J. Shannon, Professor Herkomer, Hon. John Collier, and Luke Fildes. Noteworthy works recently seen in London are Clausen's "Mowers," Walter Crane's "St. George and the Dragon," Rupert Bunny's "Forerunners," and Gotch's "Death the Bride." The principal work in sculpture is Onslow Ford's bust of a girl.

At Birmingham, a collection of more than average interest has been brought together under the auspices of the Royal Society of Artists. The president for the year, Alma Tadema, is represented by two small portrait groups from the New Gallery, "George Simonds and Family," and "Mrs. Roland Hill and Her Children." A prominent landscape is Millais' "Halcyon Days," which is flanked by Wetherbee's "Chalk Pit" and Donovan Adams's "Sunshine and Shadow," beyond which is the Chantrey work of last year, Briton Riviere's Sunset in the Arctic regions, entitled "Beyond Man's Footsteps," while to balance it on the other side is David Murray's "Dorset Downs," a scene near Corfe Castle. Mrs. Alma Tadema shows a cabinet work, "The Pain of Parting," Val Prinsep his panoramic "A Versailles," W. B. Richmond his "Persephone and Psyche in the Shades," and G. F. Watts his "Jonah." In this exhibition also are seascapes by Brett, Napier Hemy, and Moffatt Lindner; landscapes by La Thangue, Alfred East, James Orrock, and Oliver Baker, and *genre* works by Dendy Sadler, Walter Langley, and Yeames.

The corporation of Ipswich adopted at their last meeting a scheme for utilising the Elizabethan mansion in Christchurch Park, an historic building of red brick, with stone dressings, built on the site of Holy Trinity Priory in 1548 by Sir Edmund Withepol, and recently presented to the town by Mr. Felix T. Cobbold. The mansion, which consists of 16 rooms on ground floor, and 13 on the first floor, stands in the park recently purchased by the corporation, and was illustrated in the Building News for August 25, 1893. The art school built in High-street, from Mr. Horace Cheston's designs in 1882, has long been overcrowded, and under the scheme just adopted, it has been decided to remove to Christchurch all science and technical classes excepting chemistry. The rooms vacated at the High-street buildings are to be used by the Art School. The committee will also take over the entire organisation of the Working Men's College in Tavern-street, and close the present buildings, carrying on at Christchurch the commercial classes suited to the needs of the time. The kitchens at Christchurch will be fitted up for cookery classes, and the entrance hall at Christchurch will be reserved for a museum of local antiquities and ethnological museum; the three rooms on the first floor of the east wing to form a picture gallery. This would enable some part of the mansion to be always available to the public. The centre tower will be fitted up for meteorological observations, with rain gauge, anemometer, sun-register, barometers, &c. The mansion is to be renovated, and adapted for its new possessions, at an estimated cost of £600, from plans prepared by Mr. John S. Corder, of Ipswich, and the work will be carried out by day labour under Mr. Corder's direct supervision.

The quarterly communication of the Grand Lodge of English Freemasons was held on Wednesday night at the Freemasons' Hall, Mr. W. W. B. Beach, M.P., presiding. The principal business of the evening was the consideration of a motion by Mr. W. Woodward, A.R.I.B.A., a Past Master of the Eurydice Lodge, No. 1920: "That a circular be issued from Grand Lodge setting forth the scheme suggested by him, under which the Freemasons of England would contribute to the decoration fund of St. Paul's Cathedral a sum sufficient for the completion of the cupola and transepts; and the opinion of the craft be ascertained through such circular, and that such steps be taken thereafter to secure the end in view as may commend themselves to Grand Lodge." After a long discussion, in which the Revs. R. J. Simpson and C. J. Martyn and Mr. Philbrick, Q.C., Alderman Dimsdale, Mr. C. E. Keyser, and Mr. Richard Eve took part, the motion was by leave withdrawn, it being generally considered impolitic in a Masonic point of view for Grand Lodge to send out such a circular as was suggested, because Masonry, being universal and recognising no distinctions of creed, it might be tortured or misconstrued into a departure from that great principle.

The excavations promoted by the Cumberland and Westmoreland Archæological Society along the line of Hadrian's Wall have just come to an end. One very important and interesting discovery has been made at Appletree, about a mile west of the Roman fort of Birdoswald (Amboglanna). It has long been observed that at this spot a deep fosse interposes itself for nearly a mile between the wall and the vallum, running roughly parallel to these two works, but finally running into the wall about a mile and a half from Birdoswald. No one has professed to explain the existence of this fosse. Usually it has been held to be a "first shot" for the line of the wall, afterwards altered. It has now been made certain that this fosse is the ditch in front of a turf wall, built, like the vallum of Antoninus in Scotland, of regularly-laid sods, and extending probably the whole length of the ditch. This is the first trace yet found of a turf wall along the English Wall. It remains to be seen whether the clue given at Appletree will result in the detection of further traces, or whether the Appletree turf-wall is an exception. Whichever be the true explanation, the Cumberland Archæological Society is to be congratulated on one of the most interesting "finds" of the year.

Mr. Peter Bibby, architect, of Wrexham, has just patented an improvement in polling booth or secret voting desk compartments. The new booth, instead of being square like the booth now generally used, will be made in the form of a triangle, and fitted with hinges, and a drop desk also on hinges. According to this arrangement, two frames make one desk or compartment, three frames two desks, four frames three desks, and so on. Each additional frame will provide an additional desk or compartment, and these frames will be so hinged together that they can be opened and folded in the same manner as an ordinary draught or fire-screen, and the desks are so arranged that when the compartments are opened they fit into a socket, so that the booths are made quite secure and steady. The special advantages claimed for the invention are greater secrecy for voters, a very much diminished cost of manufacture, and being so much lighter in construction they will be more convenient for handling, will cost less for transit, and will not be so liable to be damaged. These advantages may be illustrated in the following manner: The booths now in use each consist of three frames—two sides and a back—so that supposing six compartments were required it would take 18 frames, whereas, according to Mr. Bibby's arrangement, only seven frames are required to make six compartments.

The Bill for the Registration of Surveyors in the Colony of Victoria appears to have fair prospects of being passed, the Government having promised to consider it immediately the Tariff has been disposed of. A verbal change made by the Parliamentary draughtsman is of some interest, being the substitution of the term "authorised" for "licensed" surveyors. Some objection is likely to be raised to a clause which would make the Bill operative as regards surveyors certified in those colonies (and those only) which pass reciprocal measures; but the majority of the profession are displaying a liberal and federal spirit in the matter. Other Australian colonies are taking analogous action. A similar Licensing measure promoted by the Surveyors' Institute of South Australia was blocked in committee last session, but under the Lapsed Bills Continuation Act will be taken up again this year. A like Bill is before the Legislature of New South Wales.

A novel co-operative system has lately been started among the carpenters and painters of San Francisco, through which the individual workmen are becoming owners of homes of their own without any cost of construction. As soon as any member of the local organisation has saved enough money to buy a lot and the necessary lumber, all his fellow-workmen turn-to the next Sunday and build the house for him. In one of the suburban additions of the city a little colony of these "Sunday homes" has already grown up. The houses are not pretentious, but are solidly built and comfortable.

The newly-built steamer *Penrhyn*, designed especially for carrying slates from the celebrated Penrhyn Bangor slate quarries consigned to the slate wharf, Bermondsey Wall, belonging to Messrs. Roberts, Adlard, and Co., is on her maiden voyage, and is expected to arrive to-day. The steamer carries electric light installation to illuminate when discharging at wharf. The voyage takes a few days, against two to twelve weeks by schooners. As instancing the present great scarcity of slates at Bangor, as elsewhere, we hear that on this occasion the *Penrhyn* is loaded in part with slates to meet another merchants' immediate requirements, Mr. Young, Lord Penrhyn's agent, finding himself unable to despatch two complete cargoes to London immediately.

A building eight stories in height has collapsed during erection in West Broadway, or South Fifth Avenue and Third-street, New York City, and has killed fifteen men, besides injuring several others. An investigation into the circumstances of the failure is being made by the superintendent of the Building Department of the City. The *Engineering Record* coments on the event, and truly says: "The fact that an extra story was added to its top should be a matter of no significance whatever, if the first seven stories had been properly designed." The writer very naturally suggests that the details may have been inadequate, especially the connection of columns and beams, as the cast-iron columns were badly broken. There can be little doubt the column sections or their junction with the beams will be found wanting, and it is hinted that the ends of these beams were connected to the columns by the usual ill-fitting brackets, details which too frequently are used in these erections. The want of proper jointing of these members has been the cause of many failures.

The late Evesham Rural Sanitary Authority employed Mr. J. Wilcox, engineer, of Birmingham, to prepare plans of a scheme for supplying some 15 or 16 villages with water from Broadway Hills, the length of pipes being about 36 miles, and the estimated cost about £12,500. The place of the rural sanitary authority has been taken by two rural district councils—those of Evesham and Pebworth—and these have now decided to adopt Mr. Wilcox's scheme.

The convener of the public health committee of the Edinburgh corporation has provisionally purchased, on behalf of the city, the farm of Colinton Mains for the sum of over £20,000. The farm is 131 acres in extent, and is situated immediately to the south of the Craiglockhart Poorhouse, extending eastward from Colinton-road to Greenbank Farm. The distance from the centre of the city is rather over three miles. The ground is under cultivation at present, and yields a rent of about 3 per cent. on the above purchase price. The farm has been provisionally acquired by the Public Health Committee for public health purposes, and should the purchase be homologated, the committee will propose that the hospitals for infectious diseases should be erected thereon.

AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2123.

FRIDAY, SEPTEMBER 13, 1895.

GETTING AWAY FROM OURSELVES.

THIS is what we are just now all trying to do, or wishing to do, or regretting that we have failed to do. We "hate the squares and streets, and the faces that one meets," and so, like the lemmings, we set out on our annual march. Nobody knows why these animals go on that journey from which they never return. But naturalists conjecture that, like the poor child in Mr. Hardy's current novel who commits suicide, they vaguely feel that "there are too many of us." It is the same feeling amongst others, which sends out crowds from the cities into the country when summer draws near to what Northumbrians call "the back-end." Everybody likes now and then to stand clear, to feel the fresh air round him, and to see his shadow fall on the open ground and not on the adjacent crowd. To a large extent this is a modern taste. The Middle Ages delighted in society. Populous towns and fertile plains were then in fashion. Rocks and mountains were held to be the haunt of demons. The world lived in dread of supernatural terrors, and people instinctively flocked together. They were still fighting the forces of nature. Frost and flood, lightning and tempest, were far too much for them, and the very surface of the earth was almost unmarked by human action. Now the difficulty is to find a place near home where human activity is not too obvious. The Land's End is littered with stalls like Kew Green or Chingford, Kynance Cove is a site for fancy shops, there is a beer-house on the top of Snowdon, and every spot which becomes celebrated for its beauty is soon strewed with sandwich-papers and bottle-necks. Our ancestors lived in company by choice, but we do so by compulsion. We find it harder and harder to get away from ourselves. And yet, while all this is going on, there are thousands of square miles in England alone where a strange face is seldom seen. There are villages by the hundred where the cottagers stare open-mouthed at a tourist, as if they had met with an angel unawares. Many of these villages are full of interest—archæological, architectural, or scientific. But they do not attract the public. The railways do not run cheap excursions there. Nobody builds vulgar hotels there, or puts down asphaltic pavements, or lights the place with gas. You can see the stars at night as you walk about. In the daytime you smell roses or carnations, or mignonette, and not the vile compound of gas-tar and gravel with which progressive parish councils are now busily besmearing their causeways. These out-of-the-way districts have no money for such "improvements," and for want of money, Nature is once more getting the better of man. This does not mean prosperity, but it often does mean beauty. Gardens overgrown, farms run wild, houses in decay form a sad spectacle, and yet sometimes a lovely one. And it is one which, in these times, architects come across pretty frequently in the course of their studies, if not of their work. Their objects of interest are seldom those of the ordinary excursionist, and so they, more than others, do manage to escape from the crowd.

But it is not merely in a physical sense that our age wants to get away from itself; it is still more the case in art, and especially in architecture. The great Romantic reaction, which began a century ago and is not over yet, has only been a convulsive attempt of the modern world to escape from its modernness. The Gothic revival, and the phases which have succeeded it, are one aspect of this great reaction. It is a reaction which has chiefly affected the cultivated classes. Those who do not read and do not think, see nothing to react against; they are in the same mental state as their great-grandfathers, and are satisfied with the same things. With three meals a day, a house over their heads, and money in the bank, they are content; they do not trouble themselves about conceptions of the universe or ideals of life. It is otherwise with those whose souls are not quite atrophied by disuse. Looking back on the past, they see that "for man's boundless wishes there were then boundless hopes; but now reality is around them and only the wishes are left." So says Jean Paul Richter, one of the first and greatest of the Romanticists, and his words are still far from being out of date. People suppose—perhaps rightly, but perhaps, also, wrongly—that they cannot bring back the hopes, and, all the more, they try to bring back the outward things that went with them. It is in human nature to hold fast to something. When it can hold fast to a belief, as it did in the Middle Ages, it thinks nothing of varying its external forms. We see no looking back in art between the Pagan revival of the 2nd and 3rd centuries, and the Renaissance of the 16th. In Mediæval times the builder was still devising something new. But when beliefs are shifting, humanity seeks elsewhere for permanence, and demands it in its houses and its churches, its architecture and its decoration.

When a man of business makes a fortune in the City—perhaps as a merchant, perhaps as a manufacturer, perhaps even as a maker of what a great cement exporter was lately heard to describe as "that abominable stuff, Portland cement"—he commonly builds himself a house, and though he wants all modern conveniences in it for practical use, he seldom wishes it to appear as modern. What pleases him best is to find an architect who can put up something which, as soon as it gets weather-stained, will seem to have been standing for ages. The artful designer, knowing what is needed, inserts here, perhaps, a hall with great mullioned and transomed windows; there, a bit of tile-hanging; higher up, some external plaster-work; and round at the back a lot of half-timbering, or what nowadays passes for it. He sketches in a garden with evergreens clipped and twisted into cones and ninepins and peacocks' tails, and makes the whole place look, at least in a drawing, as if it had been altered and added to by every generation since the Wars of the Roses. Onlookers often fancy this skill misplaced. They say the owner is a *parvenu*, who is trying to pass as the scion of an old family. But this is not the whole account of the matter. Nearly as often, perhaps, he is a 19th-century man who wishes he had belonged to the 18th, or 17th, or 16th century. He cannot get there, but he loves to have suggestions of the olden time constantly round him. He is like an Englishman in the Tropics, who has been known to grow buttercups and daisies under almost inconceivable difficulties, not because they are fairer than Tropical flowers, but because daisies and buttercups remind him of the home where he would be.

It is the same in church-building. The architects who have found fame and fortune there are mainly those who have eschewed every appearance of modernness. The ablest of them, indeed, have adapted their designs to modern uses; but this adaptation has been skilfully disguised. If their works are not mere repetitions of what the ancient architects *did* do, they are, at the best clever guesses at what they would have done for purposes like ours. Such churches may satisfy our mechanical requirements. They may find room, and room in the right positions, for a modern congregation. Their acoustics may be good; their warming and ventilation and the like may be of the latest sort; but their whole feeling and character is that of times that are far away. In the ages of faith, men did not thus copy their remote predecessors. They were always pulling down the old; always putting up the very newest of the new. In that great church-building period—the first half of the 13th century—the one idea seemed to have been to replace what had gone before by what had then just been invented. There was no clinging to the past; no regret for its disappearance. And so it was, again, when the Perpendicular style arrived. Even when Italian architecture, pure and simple, came into vogue here—in the 17th and 18th centuries—it was accepted for churches without reserve. Witness St. Paul's and the towers which group themselves around it. People were in sympathy with their own time, and liked to see its productions everywhere. But we are not in sympathy with ours: we are sick of our inventions, our arts and our manufactures, our railways and telegraphs, our post-offices and newpapers, and the everlasting hurry and worry in which we all live. So we build our churches as our fathers built them before these things were that, for an hour or two on Sundays at least, we may be able to get away from ourselves.

These are not the conditions under which much original design can be expected. Taking them into account, we may be surprised that our time has produced anything new and characteristic. What it has done in this way is, for the most part, hidden under a superficial appearance of age. It seems to beg pardon for its novelty, and to protest that it will try hard to keep it out of sight. Yet, unless the future is quite unlike the past, it is the part of our work which we 19th-century architects have invented—and not the part which we have copied with labour and pains—which will interest our successors. To see the best Gothic detail, and the best Classic detail, they will go back, as we do, to the originals, and not to our imitations. It is only where we have added something, or varied something, or invented something which was good as well as new, that they will consider our productions worth notice. Contemporary judgments will be reversed: and not the man who copied most accurately, but the man who thought most deeply, will be held to have done most for the world of art. Our posing and transposing—our trying to think like ancient monks, and to build like Elizabethan farmers—will not impress future generations much. At best, they will pardon it as the fashion of the period, and will mercifully remember that nothing else could be expected in an age when men's dearest desire was to get away from themselves.

SURVEYOR'S WORK.

IT has been the habit to associate the surveyor's work with a perfunctory, business-like precision and method scarcely known amongst architects. His buildings seem to be seen through the "atmosphere," so to speak, of a bill of quantities, and his more regular practice of building surveying, house and estate agency, has a flavour of commission and percentages. But, after all said and done, the surveyor's work forms the backbone or substratum, so to speak, of modern architecture as a profession. Unless the country practitioner is well versed in quantities and valuations, knows a good deal about house property, and the responsibilities of landlord and tenant, he has very little chance of getting on. These branches of practice constitute the only reliable bases of the architect's business in a provincial town; without them he cannot move. The landowner who wants to develop his estate must first be sure of the ground-rents he can charge, the value of house property in the locality, and a number of other details which properly belong to the surveyor's branch. He would not benefit by consulting an architect whose chief work had been confined to the drawing-board and to preparing designs. The gentleman who wished to build a model homestead would naturally go to an architect who had some experience of such buildings; who had studied such matters as farm buildings, agriculture, land-drainage. Again, the owner of houses who desired to make any improvements, would expect his adviser to know how to survey dilapidations, to interpret the law of fixtures, or the law of easements. The first thing the client wishes to know is the estimate for carrying out additions or alterations, which necessitates a knowledge of pricing work, and the estimation of quantities. Or perhaps he wants his architect to give him an estimate for sundry repairs which presupposes a knowledge of dilapidations and fixtures. The valuation of a property for mortgage or otherwise is a frequent source of profit. And yet all these matters are as far removed from architecture proper as it is possible to be, and their attainment, so far from being a help, may actually be a hindrance in some cases. They are matters which never belonged to architecture in its best days; but now they have become tacked on to it simply because they are preparatory to the architect's business or accidentally belong to it, just in the same way as a medical man may have to inquire into the sanitary condition of his patient's house. It is, perhaps, a pity for the architect's sake that the public are so ignorant of the want of connection between these businesses, and that they will go to men who are surveyors first and architects afterwards. Mr. Brown does not for a moment suspect any dissociation between the two vocations. He believes Mr. Allround Jones, who has made valuations for him and given estimates for repairs, is equally strong as an architect. And there are plenty of uncritical Browns in the world who confound common sense and tact with artistic skill in design, who mix up the commercial and the architectural functions. One of the reasons which give the surveyor-architect the advantage is the greater care he bestows on estimates and contracts. Since the profession of the architect is chiefly concerned in the proper performance of contracts, it is his duty to become the negotiating agent between the owner and the builder. In this capacity, he has to exercise several offices more or less estranged from his true vocation. The preparation of quantities is an ungenial task, but one absolutely essential in the present position of the profession. If he does relegate that duty to another, he cannot ignore it. It means that his design will be resolved into its elements, and every part priced. He has to make his specification agree with it; consider the cost of every fitting, and the result of a too generous use of material and labour. The quantities hold a prominent place between the architect and his work, and as long as a bill of quantities is an inseparable part of a contract, the architect cannot altogether overlook the surveying element of his profession. A hindrance or not, we have to look on it as a part of the compact between owner and contractor. Then the architect has to be a master of contracts, which means a good deal. He must know something of the law of contracts, be able to make negotiations, enter into arbitrations, and what not. But what has all this to do with art? Absolutely nothing.

To what extent surveying has entered into the architect's province may be seen by glancing one's eye down the list of Fellows and Associates of the Institute, prosperous men in the professional ranks, clever in negotiations, in valuations, arbitrations, and so on, but few of them architects in the highest sense of the term. These men may have done good service in the committees who sit on professional practice and charges, and schedules of building contracts. But they cannot tackle business and art both: it is folly to suppose they can. No one will for a moment deny that the surveying branch is the most lucrative, that it covers the largest field for the professional man, enables him to earn something when there are no important buildings contemplated—and these are questions for the younger men of the profession to seriously consider in their preparatory studies. How much of their attention can they devote to both vocations is the question. Now that the surveyors are represented by a separate institution, which has of late years been developing the studies of the young surveyor and examining him in three distinct sub-divisions—land agency, valuation, and building—it seems almost a useless rivalry on the part of the architect to attempt to become master of these branches.

Let us look at some of the subjects which the young surveyor has to learn if he is entering the class of "Professional Associates." Supposing he elects the sub-division of "Land Agency," he has to go through the subjects of land-surveying and levelling, book-keeping, construction and use of valuation tables, law of landlord and tenant, agriculture, farm buildings, forestry, land-drainage, geology, and agricultural chemistry. If he is going in for valuation, he has to learn, in addition to the three first, the law of fixtures, law of dilapidations, agricultural law, easements, enfranchisement of copyholds, algebra, including quadratic equations, &c. If he is desirous of becoming a building surveyor, in addition to some of the foregoing he has to learn modes of pricing work, estimation of quantities and measurement of artificers' work, and constructive and working drawings. The same student must know the laws of fixtures, dilapidations, easements, light and air, properties of stone and cement. Now these are subjects which, if properly studied, occupy a considerable portion of the student's time, and would leave him little leisure for architectural subjects. Few young men could attempt more than a "cram." What we say is, it is impossible to do justice to both businesses; one must suffer. And it is also a hindrance to a public appreciation of architecture. The ordinary commercial man is inclined to attach importance to those qualities which appear to him the most useful, and it is this fact which inclines the professional architect to give more attention to that branch of his business which is most lucrative. The businesses of surveyor and architect are also paid for on the same principle of commission—a basis which we have befors said is erroneous and injurious to the claim of art. So long as a man who makes his living by valuations and quantities can charge the same as one who has devoted his whole life to architecture, we cannot expect the better men to enter the profession. A talent for design, or a natural aptitude for art, cannot be appreciated so long as such conditions prevail. The instinctive artist is disgusted to find his taste and education no better paid for than his brother quantity surveyor. And the public will not see any difference if the profession themselves are satisfied with this mode of remuneration in placing both on an equality. Already we see signs of a revolt from this state of things. There has been a cleavage, distinct and eventful, going on in the profession. Those who have affirmatively declared that architecture is an art, not a profession, and cannot be controlled on strictly commercial principles, have gone so far as to decline to commit themselves to any examination scheme whatever. Art cannot be tested by any system of question and answer. Only lately the question of qualification for the Fellowship of the Institute showed the feeling of many members of the profession in their desire to restrict Fellowship in the future to real architects whose work is of exceptional merit. Men like Mr. Ernest George, Mr. Aston Webb, and Mr. Chas. Hadfield have clearly wished to eliminate the surveying element. Some would require evidence that the candidate was a *bonâ fide* architect, and not a land surveyor or estate agent. Many men—Institute members as well—protest against the commercial element to which the R.I.B.A. attaches so much importance. We have no better proofs of the divergence of the two classes. In the mean time, we must wait for the opportunity when able men in the art rank will be appreciated, and find their services valued. Encroachment on the architect's province is one of the drawbacks of the present state of things. The development of the surveyor and the inclusion of building in his work cannot fail to interfere with professional architects. Architecture, on the basis of building and agency, is the stronghold of provincial practice, and under present circumstances and the educational programmes of the great teaching bodies of the profession, it will be a long time before art will be able to reassert its claims and become recognised by the public. Measurement of artificers' work, valuations, and agencies are all useful branches; but we cannot think they should be confounded with the distinctive work of the architect.

OPEN-TIMBER ROOFS: A PLEA FOR THEIR DECORATION.

FASHIONS in architecture have generally been a series of reactions, more or less violent, according to the extravagant lengths to which their abettors have gone. In one direction alone—that of roof design—we have a singular instance of reactionary taste. In the earlier days of the Gothic Revival, which many of our readers remember, the timber-and-plaster imitation groined roof held for a time a supremacy; but it was quickly followed by what was known as the "open-timber roof"—a modern imitation of the old Mediæval roof. The late Messrs. R. and J. A. Brandon's work on the "Open-Timber Roofs of the Middle Ages," first published about 1849, increased the fervour for this form of roof, if it did not really introduce this mode of construction to the profession. In a very few years hundreds of new and "restored" churches were covered with roofs of this description. The Gothic apologist made a strong point in his argument against Classic—that its roofs were flat, and unsuitable to the climate, and he pointed to the open-timber roof as the only reasonable form of construction. There was no attempted disguise of material, the timbers were visible, and honestly framed, the high pitch gave height, and imparted an ecclesiastical appearance, which no flat roof could give. As usual with extremists, the open-timber-roof designer carried it too far. Architects vied with one another in trying to make the framing more complex and elaborate; they introduced "notches," "stopped chamfers," open tracery filling-in, and other kinds of detail. Every pair of principal rafters repeated the same design of framing, or they varied alternately. Looking upwards into a high-pitched roof of this sort was like looking into a dark cavern of timber: a perplexing mass of collars, struts, and braces. And the cost of a roof of framed principals was a considerable item in the expenditure of a church. Not only were roofs of churches in the Anglican Communion so treated, but every Dissenting chapel in the country was roofed on the same principle, and the wider the span, the more complex was the framing or trussing. As was to be expected, the scantlings of the

By Michael Angelo.

timbers in many buildings became reduced in size, and a pinched, starved appearance was presented by many roofs whenever the architect or contractor found it necessary to cut down the cost of the work. Other objections made themselves apparent. Where there were no direct tie-beams the rafters tended to spread from the collar downwards, sometimes thrusting out the walls, or when there were braces across the angles between collar and rafter, an injurious strain would be created on the tenon or connection of principal rafter and brace. The collar-and-brace roof is a common type: so is the cross-braced truss. Many of the hammer-beam roofs of this class failed from the want of thick walls, and the weight of the roof bearing upon the end of the hammer-beam. As a matter of fact, the designers of modern open-timber roofs tried to give the appearance of the ancient examples, but with less ample means for obtaining strength and stability. The walls were generally too thin to use double wall-plates. The latter, when used, were not strutted or trussed, as in the old examples, from the feet of the principals to the centre of bay, so as to form one horizontal plate to resist the rafters' feet. Curved or ornamental braces were introduced, again, where straight braces would have been stronger. Thus a very usual type of roof-truss is one in which the collar, principal rafters, and hammer-beams are framed with curved braces suitable only for small spans. Such trusses ought not to be too far apart, and the older examples of them to be found in Norfolk and Suffolk are generally not more than 20ft. in span, and are spaced often at less distances than 10ft. The hammer-beam roof was at one time a very favourite form; it could be made ornamental, and the old examples of Norfolk, like those of Trunch and Wymondham, supplied models. In these double-framed roofs the rafters were framed into the purlins, which, in turn, were framed into the principal rafters. Some have collar-beams stiffened by curved braces above; others have no collars, but the roof is framed with curved braces tenoned into the hammer-beams and principals. These curved braces keep to a certain extent the principals together, and act as an indirect tie to them. A more elaborate class have all these members—collars, struts, and hammer-beams—connected by curved braces. The ecclesiastical architect and builder delighted to use them, as they gave an enriched and decorative look to the interior. But the number of joints and the want of a direct tie made them costly, and not always safe, roofs, and in several cases iron tie-rods were introduced between the hammer-beams. After the elaborate-framed principal or truss, a less expensive and plainer type of roof followed, in which the curved rib or brace took the place of the hammer-beams and curved struts and braces. To the introduction of French Gothic we, no doubt, owed this change. In many of these a wooden tie-beam carried a king-post, a very usual type of roof in France during the Middle Ages, in which collars and braces were used, and sometimes stirrup-pieces. Viollet-le-Duc illustrates several examples of these cradle roofs. • Semicircular ribs connected with the principal rafters are boarded internally, and form a waggon-shaped vault, which assist sound and avoid the defects of the acutely-pointed roofs as an internal covering. Various kinds of polygonal barrel roofs, boarded underneath, or with arched principals, are to be noticed, and these have continued to the present time. Their boarded surfaces are often divided by moulded ribs into panels. The construction is simple; the principals are framed with collars and braces, or diagonal braces, which cut off the upper angle of the roof. In many recent churches, the boarded vault, whether barrel-shaped or polygonal, has a tie-beam at the springing, and often a post at the centre, as in the French roof. Occasionally, the vault is plastered. The merits of this form of construction are many. (1) The boarded or plastered vault prevents the loss of sound upwards, and its resonant qualities are helpful. (2) The boarded or plastered surface admits of colour or decoration. (3) A serious defect of the open roof, boarded on the outside of rafters, is obviated; we mean the condensation of moisture during the winter months or when a sudden change of temperature occurs. The slates are fixed on the rough boards placed on the rafters, through the joints of which the condensed vapour from the slates trickles down or falls in drops.

The question of the treatment or decoration of roofs is a large and interesting one, and we have witnessed a few changes in taste. When the open-timber-roof craze was at its height, the timbers were universally stained and varnished underneath. The darker shades of staining produced a gloomy and dark effect in the building; even the light-varnished roof got dark in course of time. These dark-stained rafters plastered between were certainly not decorative, and had a gridiron look about them. Roofs are now seldom stained and varnished in this fashion.

A revolution in taste has, happily, set in, and architects have learned that all wall and plain roof surfaces, whether boarded or plastered, are intended for decoration. But very little has yet been done to our roofs. It is true we have a few successful examples of painting or distemper decoration; but a large number of our finest halls and churches are still destitute of any scheme of decoration. In, we believe, a few cases, the mural and roof decoration in the panels has been done in thick linoleum, or some similar material, and fixed by a damp-proof process. The boarded vault divided by arched principals, often supported by marble shafts with moulded caps and bases, is almost absurd without some sort of decoration or scheme of colour.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

X.—ITALIAN RENAISSANCE: DETAILS OF APPLIED ORDERS.

IN the details of their orders, as in all else, the architects of the Italian Renaissance allowed themselves considerable liberty. To illustrate all the variations employed would consequently be impossible, for no two examples are precisely alike. The old Roman precedent is followed as to the general proportions and

general scheme, and that is all. Consequently, the accompanying illustrations must be considered as typical only, and not as examples of hard-and-fast rules which are not in one iota to be departed from; and very beautiful types they are, being the details of the orders of the Courtyard of the Farnese Palace at Rome, of which a general elevation was given in the last instalment of this series, designed by Michael Angelo, and applied to the general outline of the building as laid down by San Gallo.

Writing, then, upon the text of the illustrations, and bearing in mind that the spirit of freedom evinced is the spirit of the Renaissance, coupled as it is with the highest application of the beauty of proportion, we are struck at once, in each of the orders, with the wonderful fullness, and appropriate richness, of Michael Angelo's details. In this respect the drawings must speak for themselves, as no words can so well point out in what their beauty consists. It lies just in that exact appreciation of form and correct use of ornament, with restraint to avoid its employment where unnecessary, which evidences the true artist and architect in whatever style he may be called upon to work.

In the Doric order, the details of the arch impost are most noticeable, forming almost a complete order, with guttæ curiously placed, and with crowing cavetto moulding, all dying into the semicircular Doric columns. These are themselves on quite simple Attic bases, are unfluted, and have ordinary caps, save for the enrichment in the form of the fleur-de-lys, which occurs round the necking, and is employed again and again upon the building elsewhere, as such armorial badges commonly were in all European countries at that date. The architrave is in two faces, and is shallow, while the frieze is deep, with prominent triglyphs, and with the metopes bearing sculptured coats of arms, while the cornice so far departs from the traditions of the Doric order as to contain a row of dentils upon the bed-mould. The arches to both the lower stories are restrained in treatment, and the spandrels simply and successfully filled with circular pateræ.

The Ionic order, perhaps, conformed more nearly to tradition than either of the others, the only marked difference being in the sculptured swags upon the frieze: but, then, the Ionic frieze has at all times been open to great divergences of treatment.

The Corinthian order, on the other hand, shows considerable change and adaptability to its position. High up, and only to be viewed from close beneath it and directly in front—for it faces a comparatively narrow courtyard—it needed special treatment. Pilasters are used in place of columns, and the leaves of the capitals are simple in outline, but well projecting, giving richness of effect by sharp contrasts of light and shadow. Then, from the section, it will be seen that neither the architrave, the frieze, nor the corona of the cornice are vertical, but slope backwards, and so, according to the laws of perspective, appear much deeper when viewed from below than they are in reality, being foreshortened. The architrave and frieze particularly need this extension, for in elevation they appear shallow. The use of triglyphs in in place of modillions (or consoles) under the cornice is also remarkable, and not so happy.

The great feature of the Farnese Palace, however, is the main cornice, crowning the exterior. Again it is best to leave the detail to speak for itself. There is no architrave, and the frieze is enriched with the *fleur-de-lys* alternating with an anthemion composed of acanthus leaves, while as for the rest there is no point which can be called uncommon; but it is strong and beautiful and suitable—and what more can or need be said? It is an example of power and restraint combined, and worthy to serve as a model; but as in it forms are used for which there is precedent, without copyism, so to copy this itself would not be wise, but rather it is the spirit in which it was devised which should be cultivated.

THE CITY AND THE ENGINEER.*

(*Continued from p.* 329).

HOW to provide a government for a city of metropolitan dimensions is a matter of difficulty not yet worked out, for a metropolis does not need the same amount of governing in all its parts. There are governmental functions which affect all parts alike, such as we usually see exercised by counties; there are others which are locally, but not universally, required, such as we see exercised by our city and village corporations. General policing, courts, criminal and civil, the care of the poor and helpless, asylums for insane, gaols and houses of detention, are matters in which the sparsely-populated parts of a metropolis are as much interested *per capita* or unit of value as the densest. To these may be added main thoroughfares for traffic and public buildings. Next in possibility of extended interest is drainage, sanitary and surface, but the interest will not be uniform. It will be limited usually by watersheds, and will vary with the user of the ground. Closely following in extent and variation of interest is that of water supply. More narrowly local, are sewers for complete sanitary or surface drainage, the making, maintaining, cleaning, and lighting of streets, and many other functions that belong to local affairs. An organisation suited to the conditions presented by a metropolitan city in the United States must of necessity be complex—a goodly measure of autonomy should be reserved to certain component parts, and the more general powers vested in a superior body. The proposition introduced in the Illinois Legislature a few weeks since, to confer special powers of legislation upon a local assembly for Chicago, is by no means absurd. It contains an element of adaptation to obvious needs. The country representative has

DETAIL OF IONIC ORDER, COURTYARD, FARNESE PALACE, ROME.

By Michael Angelo.

no appreciation of the needs of cities, and too frequently is influenced by a spirit of hostility to the city. A goodly measure of autonomy is essential to a metropolis. Building along more familiar lines, the functions of the county may be expanded to include all needed by the whole metropolitan district; but the machinery of county government would need to be entirely remodelled, whether it be of the representative form common to the northern and eastern states, or by county court, as in the south and some western states. But the essential idea of counties with township organisation is the one that seems to be most practicable. But schemes of government are not usually worked out by engineers, and I pass to considerations more immediately pertinent to my audience, and the first is the manner of inaugurating and controlling public works. In a great city there are several departments of public works, each of which will be of sufficient importance to justify its having a chief technically and practically familiar with that department, and broad enough in his constitution to understand that his department is part of a whole, and to rightly estimate its relation to each other part, and to the whole. If so constituted, each chief will be a fit and valuable member of a controlling board of public works. Such departments may be specified as:—1. Streets: their laying-out, gradation and construction, maintenance, cleaning, sprinkling, and general supervision. 2. Waterworks: design, construction, extension, distribution system, operation, and oversight of use. 3. Sewers: studies of system, plans, construction, maintenance, oversight of use. 4. Electricity and gas: all matters pertaining to lighting of streets, public places, and buildings. Subways or conduits, construction or use. Also all overhead wires and their supports. Control of measures to insure public safety as affected by the distribution or use of electricity, gas, or other means used for light, heat, or power furnished beyond the limit of the premises where it is produced. 5. Buildings: oversight of construction, repairs, and care for public buildings. Also supervision of erection, repair, and condition of private buildings so far as needed to insure observance of regulations. 6. Transportation: railways, switches, harbour and docks, and other services by corporations semi-public in character. 7. Parks and recreation grounds: laid out, improved, maintained, and controlled. 8. General superintendent, or chief, to whom may be given the supervision of matters not specially assigned, but better if without departmental duties, who shall exercise control over expenditures, shall sign all contracts, approve all appointments of subordinates, issue all special tax bills, and keep the general records. If you will consider these departments, you will see that each requires a man specially fitted; also that their inter-relations are so intimate as to suggest a grouping. If these heads constitute a board, then the grouping suggested points out the appropriate committees to prepare and consider all measures brought before the board. The heads of departments should not directly have to do with legislation of a general character, but all measures providing for public works, and the manner of their execution, also the estimates of cost, should originate in the board, be subject to approval or disapproval by legislative body or councils and mayor, but not to amendment by them without consent of the board. The board should let all contracts, approve of all final estimates, and order the making of special assessments. No measure or order contemplating work to be paid for by special assessment should be recommended or issued without giving parties to be assessed an opportunity to be heard by the board, or a committee thereof, as the importance of the matter may justify. Neither the board nor any of its members should have anything to do with the collection or disbursement of moneys. Some of these heads of departments would, by logical necessity, be engineers without its being required by law; others might not, and I would be disposed to require that qualification for street, water, sewer, and electric departments. Buildings should be given to an architect. The other positions might be left open on condition that the five named officers are limited to men of technical and practical training; otherwise the last or general superintendent must be an engineer. This last should be an elected officer, and rank as high as the highest, for he will at times need to be independent of mayor, council, or other authority or influence. His function within his sphere is something like that of the doctor or councillor—legal or spiritual; he will have to give unwelcome advice, oppose pet schemes, and perhaps resist evil. The other heads of departments may properly be appointed by the mayor, but at a time and under conditions that will farthest separate them from being dictated by purely political considerations. An organisation such as I have sketched will be able to handle the public works of the largest city, and do so economically. Of course, there must be a number of sub-departments and many subordinates in each case. What is commonly called engineering work will be done in and under the sub-departments. A prominent feature of this scheme of municipal works organisation is specialisation. As a schooling place for young engineers of unformed intentions I do not recommend city employment. It is better by far that such take their first practical initiation in connection with private parties engaged in general practice of city work. There are useful traits or habits of mind that prepare one for department special work, which can be better obtained where strict economy of time and means are enforced and study made to reach ends by the shortest road than in any public office. The unofficial engineering in a great city is greater in volume than the official, and will doubtless increase in volume and importance. For no small part of the extension of improvements must be made under private engineers, representing and serving individuals or corporations, who will develop and improve new quarters more rapidly, more consistently, and more cheaply than is possible under official restraints. And, in fact, I anticipate that it may be found practicable to turn over to the private practitioner much of the routine and detail work of profiling, cross-sectioning, staking out, estimating, and possibly superintendence of construction, especially in case of assessment work. Men who can find, or make and hold, their place in this unofficial practice will be found better qualified to assume the headship of a sub-department than persons exclusively trained inside of the department. And the same is true for department chiefs, for the outside man has spurs and inducements to special studies, and the development of that valuable faculty known as executive ability, that the inside man does not feel. The inside man tends to fall into routine ways, to cling to traditional methods, and to resist new suggestions as troublesome innovations. I have in mind a city which in its early stages of growth was limited to the broken ground adjacent to the river on which it was situated. A practice which became a canon was to make the minimum of street gradient 1½ per cent. In time the city grew beyond the rough ground near the river, and extended into the nearly level uplands. It required time and almost drastic measures to check and prevent the extension of the traditional minimum into districts where it involved the heaping up of summits and formation of artificial depressions into a series of short, meaningless waves. In fact, a considerable area of territory was permanently defaced before a thorough reorganisation of departments made it possible to cast aside the arbitrary minimum of the early days. The co-ordination and co-operation of official and private engineers is practicable, for it exists, to a considerable degree, in all large cities. My suggestion is to extend and systematise a relation found to give good results. In my experience a decided advantage results from bringing into contact the private engineer who looks at plans and propositions from the property-owners' peculiar point of view, and the official whose point of view may be too far-reaching for him to notice that he would overtax the resources of to-day in the effort to provide for a distant future. Bringing these elements together is productive of the happy working mean. The board of public works should be the central authority which forms general plans and determines the policy to be pursued, vested with authority to revise, approve, or reject all projects for improvements within metropolitan limits, from the laying of a house drain or the building of a shed to the development of a system of railway terminals or the building of a business palace. This oversight should be so exercised as to afford the maximum of freedom to individual or corporate enterprise, subject always to the condition that the public safety and convenience must be provided for; because the official board is first of all the guardian of public interests. The plans and policy of a board of public works are subject to limitations of a financial nature. It must cut the garment to suit the quantity of cloth furnished. Engineers, and especially specialists, are not qualified to handle questions of finance; but they must familiarise themselves with the limitations which financial considerations set to their plans, and must adapt themselves to such conditions as much as to physical. Three methods of providing means for improvements under city authority are in use:—(1) Borrowing, on credit of municipality or subdivision thereof; (2) general and special funds of municipality; (3) assessments upon property benefited. Many improvements are now being made by private enterprise which bring the engineer close to financial considerations. In my opinion, this practice will greatly increase. To some extent improvements are made in this way, after the streets are opened as public, by consent of the constituted authorities, plans, materials, and methods of construction being approved, and the work done to the satisfaction of the officials. Some claim that better results are thus obtained, and at less cost than if done in the routine way prescribed for improvements under city authority; as to the probability of such comparative results I say nothing, for no general statement can be made. It ought not to be so, and when it is there is something loose or wrong in the conduct of public work. By far the larger part of improvements made under private supervision is done in anticipation of putting property on the market. To that branch of the subject I will return. Of the methods of municipal works finance named above, an engineer is at times called on to express an opinion. Borrowing is advocated generally upon the plea that the improvements are for the benefit of the future rather than of to-day, therefore posterity should foot the body of the bills. I have in mind cases in which the only evidence posterity has that improvements were made is the burden of paying for them. Borrowing by municipalities may be advisable or not, just as in the case of individuals or corporations; the outcome may be prosperity or bankruptcy. It is never well to borrow for living expenses or for matters of temporary use. If the use of borrowed money is to create a value or asset greater than its cost, then posterity has no ground to complain, and this is as near the enunciation of a general principle as it is possible to come. The attempt to provide for improvements out of general and regular municipal revenues will always fail. A large revenue in sight, not specifically pledged, leads to extravagance and wasteful expenditure in every department of city administration, and when a scale of expenditure is once established it becomes practically impossible to curtail it, as reformers who have undertaken the task well know. The only way to keep fixed expenses down is to keep general revenue within close limits. The ideal plan of revenue might be to fix general revenue at an unalterable percentage of assessed value and shut off all other sources of income. Special funds for special objects may then be created to which all income, other than property taxes, may be devoted, and such special rate of property tax as the people may authorise, the question of such authority being resubmitted to the voters at short intervals. There are many improvements in a city so general in their character that their cost must be borne by the whole city. There are others which, with equal certainty, are so clearly local that beyond question they should be paid for as local benefits—that is, by special assessments. Though, as I have said, the engineer is not a financial expert or in form a financial officer, he comes very close to the question of special assessments, for his plans must be studied with reference to an equitable distribution of the cost of proposed works. He virtually defines the boundaries of benefit districts, and must see to it that they include all beneficiaries; with details he has nothing to do. Grading streets and all expenses by way of costs and damages incident thereto; paving all streets, except main thoroughfares, and these in part; sewers, almost without exception, in great cities; water distribution, except mains, and these in part; repairing, cleaning, and watering streets, and the removal of garbage, ashes, and rubbish, are each and all properly the subject of special assessments; and you will notice that the list includes nearly all the public works of a routine type. A great city is impossible upon any other principle than that the beneficiary must pay for what he enjoys. Equally fundamental is the axiom that if he enjoys he must expect to pay proportionately. Further, he who lives and prospers in a city must expect to have a scale of necessary expenses approximately in proportion to the size of the city he lives and prospers in. It is altogether a mistake to put among the supposed reasons why the drift of population is towards large cities, the idea that they can live more cheaply. So far as economical reasons may influence the tide, it is the expectation that more of comfort and pleasure can be had as the result of one's efforts in the large than in the small town or country; and then there is in the minds of some the chance of winning one of the grand prizes of fortune of which they read so much. The way to realise a municipal millennium is to impress upon the minds of the working people of America that their case is hopeful; that if they will exercise industry and cultivate habits of thrift and tastes for home and modest social enjoyments, a good degree of comfort for themselves and a hopeful future for their children may be had, as well under the new conditions of life we are coming to as has ever been possible. To dispassionate consideration there is nothing to be said against, but much for, the segregation of people according to their circumstances. The palace and the hovel, if near together, are the occasion of envy and mutual dislike. To such segregation the tendency in the large cities is manifest and irresistible. You will have already observed that this address has running through it a thread of optimism to the effect that, when a tendency towards a certain line of action by large masses of men, and especially if the same line of action is independently adopted in places widely differing in their race and industrial characteristics, then I interpret the facts to mean that a natural development is being worked out, and that such are likely to prove themselves to be of the beneficial order rather than of the contrary. I suggest the study of such unfolding tendencies, so that an intelligent policy be pursued towards them. Now this segregation of classes becomes possible only in large cities, and develops just to the degree that it is possible, and therefore may be claimed to be in accord with the nature of men. These segregations superficially appear to follow the freaks or whims of fashion, but in truth there is reason why certain quarters should become favoured by the rich and why all who can afford it seek to live near to if not in them. One consideration is the possibility of passing to and fro by public conveyance without coming in contact with people of filthy or repulsive habits, or passing through burnt districts whose scenes and sounds are not fit for the eyes and ears of wife and children. Associations of every nature are more and more becoming organised and developed along the lines of congeniality of tastes, identity of interest, accordance in principles. It is, therefore, to be accepted that there will be residential quarters exclusively occupied by the very rich; others by those in well-to-do circumstances, and so by degrees down to the lowest condition that can be allowed to exist. The city engineering that undertakes to apply an invariable grade and kind of public improvement to all parts of a town is mistaken and wasteful. True skill adapts itself to conditions and spends in view of probable returns. Beginning with the layout of the ground; a high-grade residence section should have wide streets, deep lots, and liberal frontage to lots, with restrictions as to character and position of building. No alleys should be allowed. In other words, for such a purpose the appropriation of land should be lavish to be in keeping with the character of improvements and with the luxurious life of residents. For well-to-do residence sections the same principles should apply with less width of streets, depth, and individual frontage of lots, but the appropriation of ground should be generous. For the comfortably circumstanced, who must consider limited income, a third scale in appropriation of ground is called for, and for those who must live close, a fourth. A good limit for width of street for fourth-class districts is 60ft., which fixes the least possible distance between house fronts. Eighty feet for lot depth is also a good limit, for the depth of lots should be so small that ordinary sanitary restrictions concerning light and air will prevent tenements on alley fronts. Alleys in rear of lots for the third and fourth grades are a convenience, an approach being necessary. The limits named will permit and almost compel a space between buildings at rear equal to that in front. No consideration of adaptation to business purposes need be given in the layout of the two first-named grades; and the layout of the last two will be naturally adapted to such business purposes as are necessary and appropriate. Lands along or near lines of transportation by water or rail will naturally come to be occupied for business purposes. Also those immediately adjacent to principal courses of drainage. Along transportation lines the unit of subdivision may profitably be the block, for the tendency is towards a generous use of land area for industrial establishments. We commonly speak of cities as noted for their commerce, manufactures, art, and seldom think that the most important product of a city is the material for its own continuance and progress—the boys and girls reared within its borders. No direct measure of the importance of securing the highest quality for this human product is possible; we can best estimate it by considering the reverse side, the horrible consequences of failure. It costs more money to restrain the vicious and care for the wrecks of humanity than to provide safeguards against lapse into vice or against physical degeneracy. We commend the enterprise of the merchant who spends money freely to extend his business; of the manufacturer who throws out machines and processes, because better may and therefore must be had. We think well of the professional man who holds loosely the traditions of the past, and is ready to adopt that which gives promise of better results. Why, then, should municipal authorities, and especially the taxpayer, hesitate to meet necessities clearly arising by measures suited to the occasion? It costs money, and much of it, to build a city; also to maintain and operate it; the human as well as the physical part. Beginning with the bare site for a city, the first step is destructive of former value; the use of the land to bear crops is at an end. Streets must be opened and given a grade suited to traffic; the adjoining grounds, if not in due relation to the street as graded, must be brought into such relation by cutting or filling. In this passing from one use to the other there must be of necessity the loss of former value or damage on the one hand, and the substitution of a new value from adaptation to another use or benefit. When this change is made by the municipality by enforced proceedings the adjustment of compensation is one in which the view of the engineer, who sees what is to be, and that of the owner, whose view is backward, are far apart. The court comes in as an arbiter, and is usually strangely oblivious to the possible benefits and ready to take an exaggerated view of the passing values. What shall the engineer do? Break the alignment of the street to avoid buildings, or some tree which has become as the very apple of the owner's eye? Shall he sacrifice the grade and follow the natural surface so that the adjoining property may be at grade without cost or sacrifice? Or shall he consider that street and grade will remain long after building, tree, and owner have passed away?

(*To be continued.*)

THE BRITISH ASSOCIATION AT IPSWICH.

THE sixty-fifth annual gathering of the British Association for the Promotion of Science is being held this week in the picturesque and thriving county town of Suffolk, and the proceedings promise to be of considerable interest.

The inaugural address of the President, Sir Douglas Galton, D.C.L., F.R.S., was delivered in the Public Hall at Ipswich, on Wednesday, the topics being the conditions under which science was pursued at the time of the formation of the Association in 1831, and the claim was advanced that the Association had rendered considerable assistance in the progress that had been made. The greater accuracy secured in all machine work by Sir Joseph Whitworth's labours to get true plane surfaces and correct tactile measurements, the development of geological and geographic knowledge, in chemical, astronomical and physical sciences, and also in biology and bacteriology, were successively passed in review. Turning next to engineering matters, the President referred in detail to the question of sewage purification. The early reports to the Association showed, he said, that the laws of hydrostatics, hydrodynamics, and hydraulics necessary to the supply and removal of water through pipes and conduits had long been investigated by the mathematician. But the modern sanitary engineer has been driven by the needs of an increasing population to call in the chemist and the biologist to help him to provide pure water and pure air. The purification and the utilisation of sewage occupied the attention of the British Association as early as 1864, and between 1869 and 1876 a committee of the Association made a series of valuable reports on the subject. The direct application of sewage to land, though effective as a means of purification, entailed difficulties in thickly settled districts, owing to the extent of land required. The chemical treatment of sewage produced an effluent harmless only after having been passed over land, or if turned into a large and rapid stream, or into a tidal estuary, and it left behind a large amount of sludge to be dealt with. Hence it was long contended that the simplest plan in favourable localities was to turn the sewage into the sea, and that the consequent loss to the land of the manurial value in the sewage would be recouped by the increase in fish-life. It was not till the chemist called to his aid the biologist, and came to the help of the engineer, that a scientific system of sewage purification was evolved. Dr. Frankland many years ago suggested the intermittent filtration of sewage, and Mr. Baldwin Latham was one of the first engineers to adopt it. But the valuable experiments made in recent years by the State Board of Health in Massachusetts have more clearly explained to us how by this system we may utilise micro-organisms to convert organic impurity in sewage into food fitted for higher forms of life. To effect this we require, in the first place, a filter about 5ft. thick of sand and gravel, or, indeed, of any material which affords numerous surfaces or open pores. Secondly, that after a volume of sewage has passed through the filter, an interval of time be allowed, in which the air necessary to support the life of the micro-organisms is enabled to enter the pores of the filter. Thus the system is dependent upon oxygen and time. Under such conditions the organisms necessary for purification are sure to establish themselves in the filter before it has been long in use. Temperature is a secondary consideration. Imperfect purification can invariably be traced either to a lack of oxygen in the pores of the filter, or to the sewage passing through so quickly that there is not sufficient time for the necessary processes to take place. And the power of any material to purify either sewage or water depends almost entirely upon its ability to hold a sufficient proportion of either sewage or water in contact with a proper amount of air. Passing on to consider, in the next place, smoke abatement, Sir Douglas Galton remarked: While the sanitary engineer has done much to improve the surface conditions of our towns, to furnish clean water, and to remove our sewage, he has as yet done little to purify town air. Fog is caused by the floating particles of matter in the air becoming weighted with aqueous vapour. Some particles, such as salts of ammonia or chloride of sodium, have a greater affinity for moisture than others. You will suffer from fog so long as you keep refuse stored in your towns to furnish ammonia, or so long as you allow your street surfaces to supply dust, of which much consists of powdered horse-manure, or so long as you send the products of combustion into the atmosphere. Therefore, when you have adopted mechanical traction for your vehicles in towns, you may largely reduce one cause of fog. And if you diminish your black smoke, you will diminish black fogs. In manufactories you may prevent smoke either by care in firing, by using smokeless coal, or by washing the soot out of the products of consumption in its passage along the flue leading to the main chimney-shaft. The black smoke from your kitchen may be avoided by the use of coke or of gas. But so long as we retain the hygienic arrangement of the open fire in our living-rooms, I despair of finding a fireplace, however well constructed, which will not be used in such a manner as to cause smoke, unless, indeed, the chimneys were reversed and the fumes drawn into some central shaft, where they might be washed before being passed into the atmosphere. Electricity as a warming and cooking agent would be convenient, cleanly, and economical when generated by water power, or possibly wind power, but it is at present too dear when it has to be generated by means of coal. Our descendants may possibly learn so to utilise electricity that they, in some future century, may be enabled by its means to avoid the smoke in their towns. In other branches of civil and mechanical engineering, the reports in 1831 and 1832 on the state of this science show that the theoretical and practical knowledge of the strength of timber had obtained considerable development. But in 1830, before the introduction of railways, cast iron had been sparingly used in arched bridges for spans of from 160ft. to 200ft., and wrought iron had only been applied to large-span iron bridges on the suspension principle, the most notable instance of which was the Menai Suspension Bridge, by Telford. Indeed, whilst the strength of timber had been patiently investigated by engineers, the best form for the use of iron girders and struts was only beginning to attract attention, and the earlier volumes of our *Proceedings* contained numerous records of the researches of Eaton Hodgkinson, Barlow, Rennie, and others. It was not until twenty years later that Robert Stephenson and William Fairbairn erected the tubular bridge at Menai, followed by the more scientific bridge erected at Brunel at Saltash. These have now been entirely eclipsed by the skill with which the estuary of the Forth has been bridged with a span of 1,700ft. by Sir John Fowler and Sir Benjamin Baker. The development of the iron industry is due to the association of the chemist with the engineer. The introduction of the hot blast by Neilson, in 1829, in the manufacture of cast iron had effected a large saving of fuel. But the chemical conditions which affect the strength and other qualities of iron, and its combinations with carbon, silicon, phosphorus, and other substances, had at that time scarcely been investigated. In 1856 Bessemer brought before the British Association at Cheltenham his brilliant discovery for making steel direct from the blast furnace, by which he dispensed with the laborious process of first removing the carbon from pig-iron by puddling, and then adding by cementation the required proportion of carbon to make steel. This discovery, followed by Siemens's regenerative furnace, by Whitworth's compressed steel, and by the use of alloys and by other improvements, have revolutionised the conditions under which metals are applied to engineering purposes. Indeed, few questions are of greater interest, or possess more industrial importance, than those connected with metallic alloys. This is especially true of those alloys which contain the rarer metals; and the extraordinary effects of small quantities of chromium, nickel, tungsten, and titanium on certain varieties of steel have exerted profound influence on the manufacture of projectiles and on the construction of our armoured ships. A new branch of investigation, which deals with the micro-structure of metals and alloys, is rapidly assuming much importance. The President also referred to the measures taken by the State in Germany for the promotion of science teaching and of research, efforts which in Great Britain were mainly carried out by voluntary agency, which had the advantage of being unfettered by State control. In conclusion, he observed that the growing connection between the sciences placed their annual meeting in the position of an arena where representatives of the different sciences had the opportunity of criticising new discoveries and testing the value of fresh proposals, and the presidential and sectional addresses operated as an annual stock-taking of progress in the several branches of science represented in the sections. Every year the field of usefulness of the Association was widening, and he expressed full confidence that the future records of the British Association would chronicle a still greater progress than that already achieved, and that the British nation could now maintain its leading position amongst the nations of the world, if it would continue its voluntary efforts to promote research, supplemented by that additional help from the Government which ought never to be withheld when a clear case of scientific utility had been established.

The work of the sections was commenced yesterday (Thursday). In Section A, the President, Professor W. M. Hicks, took as the subject of his address, "The Fluid Theories of Ether and Matter." To-day (Friday) a joint sitting will be held with Section B, when Prof. A. Schuster will open a discussion on the evidence to be gathered as to the simple or compound character of a gas from the constitution of its spectrum. There will also be discussions in this section on the question of a new practical unit of heat, introduced by a paper from Mr. E. H. Griffiths, and on the teaching of geometrical drawing in schools, introduced by Prof. O. Henrici.

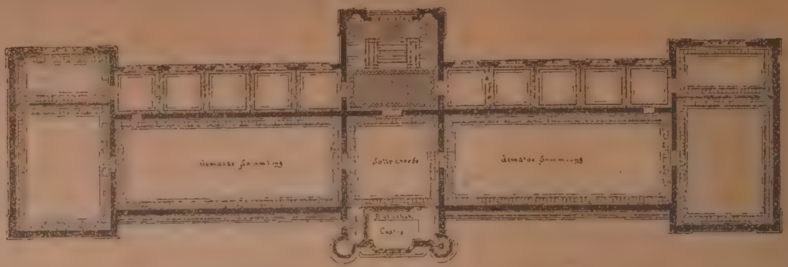
In Section B, the President, Prof. R. Meldola, dealt in his address, yesterday, with the relations of physiology and chemistry, and Monday next will be devoted chiefly to papers dealing with the relation of chemistry to agriculture, and Tuesday will be given up to papers on organic chemistry.

In Section C, the address of the President, Mr. Whitaker, will be devoted to the subterranean geology of the Eastern Counties, as exhibited in various deep borings and wells. Mr. Whitaker will also have a paper on the latest results in the boring for coal now being made at Stutton, opposite Manningtree, on the Suffolk bank of the Stour. The other papers on local questions will deal mainly with newer Tertiary geology; Ipswich being a convenient centre for the study of our Pliocene and Pleistocene deposits. Among the miscellaneous communications, Mr. Joseph Francis, the engineer to the New River Company, will have one on the method adopted to ascertain the direction of the dip in the Palæozoic rocks met with in the deep borings at Ware and Cheshunt. Papers are also expected from Mr. T. V. Holmes, on the ancient physiography of South Essex; and from Messrs. Reid and Ridley, on the Arctic and Palæolithic deposits at Hoxne.

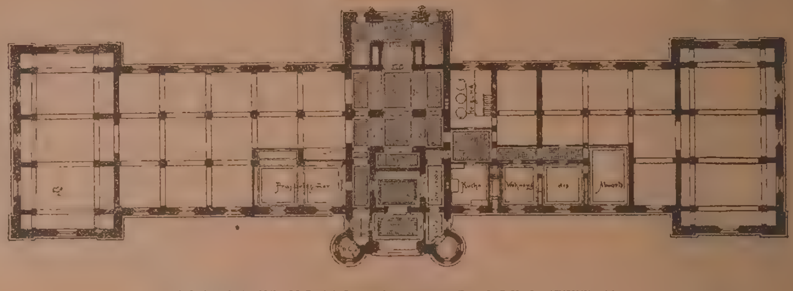
Section D will meet under the presidency of Professor W. A. Herdman, and, for the first time in the history of the Association, it is a section of zoology alone.

In Section G, Mechanical Science, the President, Professor Vernon Harcourt, gave his address yesterday, the subjects treated being the relations of mathematics, physics, chemistry, meteorolgy, and geology to engineering, and the benefits resultant from the growing specialism of branches of that science. Papers were also read on light railways in agricultural districts, by Major-General Webber; congelation of soil for foundation purposes, by Mr. M. Gobert; and on the coal borings at Bentley, between Ipswich and Stutton, by Mr. R. C. Rapier. To-day (Friday), the papers include the growth of the port of Harwich, by Mr. W. Birt; notes on the improvement of Maas in connection with Hook of Holland route, by the President; Snowdon tram-road, by Sir Douglas Fox; river-weirs and flood prevention, by Mr. F. G. M. Stoney. To-morrow (Saturday), dredging operations at Mersey Bar, by Mr. A. G. Lyster; deodorising sewage by Herzite process at Ipswich, by Mr. J. Napier. Monday will be devoted to electrical papers.

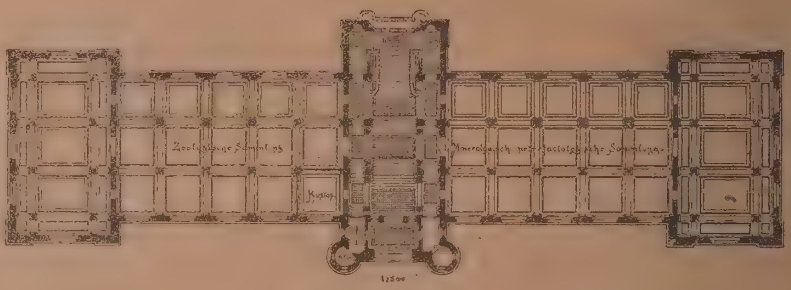
Professor Flinders Petrie inaugurated Section H with an address yesterday, in which he referred to the Neolithic invaders of Egypt. The excursions are varied in character. To-morrow (Saturday) afternoon the geologists will visit the well-known crag district, including Orford, Sudbourne, and Chillesford. On the same afternoon, there will be a dredging excursion down the Orwell, whilst other parties will go to Bury St. Edmunds, to Helmingham Hall, and to Southwold. Next Thursday afternoon, after the meeting, there will be another dredging expedition, and also an excursion to Colchester, to the Flint Knapping Works at Brandon, and to the Broads. The geologists on that day will go to the Norfolk coast to examine the Glacial and Pliocene deposits in the neighbourhood of Cromer.



UPPER PLAN, MUSEUM, SOLOTHURN.



BASEMENT PLAN, MUSEUM, SOLOTHURN.



GROUND PLAN, MUSEUM, SOLOTHURN.

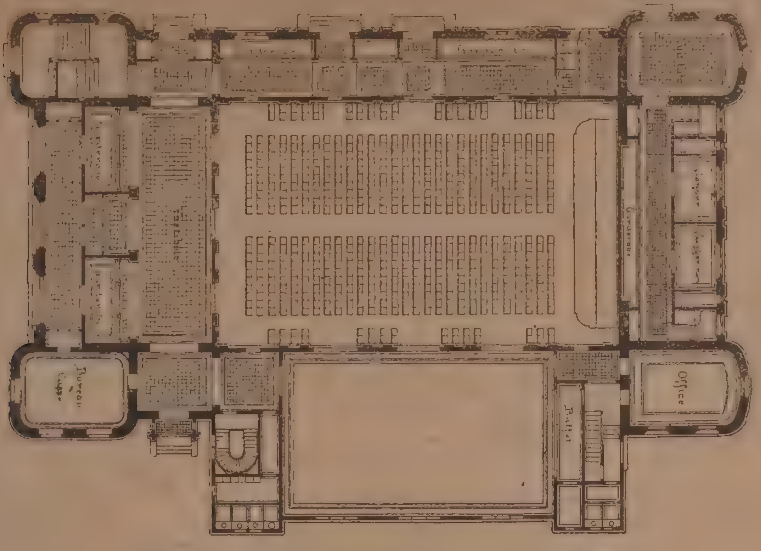
NEW MUSEUM AND CONCERT-HALL, SOLOTHURN.

MANY towns in Switzerland had fortifications, but Solothurn not only kept them the longest, but was the only town in the little Republic in which the building of the fortifications were ever finished. They were not completed in other places, partly on account of want of funds, and partly because, being expensive, the building extended through so long a period of years that they were outrun by the improvements made in the art of warfare, and thus rendered practically obsolete before they were finished. Solothurn was, therefore, up to a comparatively short time ago, a complete model of the fortifications of the 17th-century after the plans of Vauban. As in other places, so here—the fortifications were obliged to give way to the increase of the size of the town, and, unfortunately, have not been treated with much consideration. For instance, the beautiful Basel Gate (see view in Concert Hall) was already partly pulled down when a more enlightened view of the interest attaching to historical buildings was taken, and an order for its restoration issued and instantly put into practice.

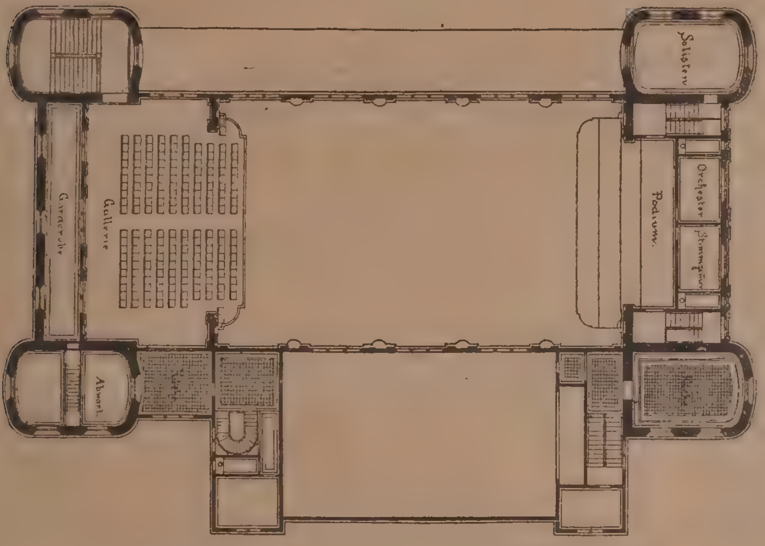
Even now the inner town has a most picturesque, artistic, and unique appearance, surrounded as it is by broken ramparts and numerous beautiful towers. Still, it is evident the inhabitants do not set much value upon this, as will appear when, on passing through one of the old openings into the outer town, one comes quite suddenly into broad streets with houses and gardens of newest date. One is astonished and hurt with the unsuitableness of this sudden contrast, these modern buildings being quite out of character with the old town, and very commonplace, too, in appearance.

In the designs illustrated to-day for a new Museum and a new Concert Hall, which are to be placed adjoining the old fortifications and the Basel Gate, it has been the endeavour of the architect to avoid this contrast by using for the elevations only those motives contained in the fortifications of Vauban and the old houses in the town, and especially has it been desired to make the new Music Hall form, with the old Basel Gate, one harmonious architectural feature.

For the museum the requirements provided



GROUND PLAN, CONCERT HALL, SOLOTHURN.



GALLERY PLAN, CONCERT HALL, SOLOTHURN.

one department for zoology, one for minerals, and another for painting, sculpture, copperplates, &c., consisting of a "salle carrée," several large galleries, and a number of cabinets. In the basement, not more than a yard underground, there were stipulated for a room for the practice of taxidermy, a dwelling for the attendant, and store-rooms for packing-cases, &c.

For the Concert Hall, to be built partly in half-timber, was required a large hall with gallery, and podium, size as given in the ground plan, a smaller room with restaurant in close connection, with the larger hall so that they could be combined if needed, cloakrooms, and usual offices for the public, and separate rooms for the artists, also a dwelling for the attendant. Mr. Alexander Koch, of London, is the architect for these buildings.

* * *

ARCHITECTS AND FIREMEN AT AMSTERDAM.

THE work of the architect and the work of firemen are so closely allied in combating the fire fiend, the one in erecting buildings so as to prevent the origin and spread of fire, and the other in extinguishing the enemy, that it behoves us to make some comments upon the International Congress to be held among architects, engineers, and firemen in Amsterdam from the 24th to the 28th instant.

The programme of subjects put down for discussion is long and comprehensive, divided under the following heads: (1) Measures for the prevention of fire; (2) extinction and salvage; (3) construction and planning of buildings in respect of danger from fire.

These heads are further subdivided for papers to be read upon the warehousing of combustible merchandise; the construction of furnaces, ovens, and chimneys; measures for the prevention of spontaneous combustion; inflammability of various oils; construction of lamps; lightning conductors; electricity, &c.

The second heading, on fire service, includes organisation of fire brigades in large cities and small towns, water supply, appliances for extinction of fire and saving life, means of lessening damage by water, and such-like matters of detail pertaining exclusively to fire service, interesting in themselves, but not so important to architects as those points provided for discussion in the third series. It may be mentioned, however, that under the second series the planning of fire-stations is included, and that Mr. Thomas Blashill, the architect to the London County Council, will contribute a paper upon the arrangements made in the London Fire Brigade stations, which have been erected from his designs and under his superintendence by the Fire Brigade Committee of the London County Council.

The papers under the last series will naturally be the most interesting to architects, and these will be mostly read by architects and engineers. Building materials and fireproof construction, construction and planning of the interior of houses, number and position of staircases, exits in case of fire, exterior balconies, &c., will form subjects of discussion. The important questions of the construction of public buildings, theatres, assembly-halls, will not be omitted. A paper upon the prevention of fires in theatres will be contributed by Mr. Ernest A. E. Woodrow, while Mr. Edwin O. Sachs, the honorary secretary in England for the Continental Section of the National Fire Brigade Union, will read a paper upon exits from places of public entertainment.

The third section will also embrace such subjects as the planning and construction of hospitals, shops, workshops, warehouses, and stores for highly inflammable materials.

In order that the Congress may be a success and of general interest, it will be necessary to have the collaboration of experts in the various branches of the fire service, and in the list of the committee published we see the names of Sir Eyre M. Shaw, Captain Simonds, of the London Fire Brigade, the chief officers of the Berlin Fire Brigade, as well as of the Amsterdam and other Continental fire brigades, architects, engineers, and well-known fire experts.

The importance of this conference to architects is sufficiently obvious from the outline of the programme we have sketched. We trust to be able to give some further notes as to the proceedings, which are of special interest to the profession.

* * *

BELFAST FIRE BRIGADE STATION.

[WITH ILLUSTRATIONS.]

AT the late conference of the Incorporated Association of Municipal and County Engineers, held at Portrush, Mr. James Munce, A.M.I.C.E., M.S.I., assistant city surveyor for Belfast, read the following paper:—In 1892 the staff of the Belfast Fire Brigade was composed of six permanent men and 29 auxiliary men, who gave their services when called upon, making a total of 35 available in case of necessity. During the day, as the auxiliary men were scattered over the city engaged at their ordinary avocations, messengers had to be despatched on cars for them; and at night, these auxiliary men had to be called up from their houses about 300 yards from the station. The horses were hired by contract and stabled on the premises; but, as they were frequently changed, it could not be expected that they would show much intelligence. It will be seen from this that some considerable time might elapse between the receipt of an alarm and the concentration of the whole strength of the brigade upon a fire. The urgent necessity for continuous improvement in the department will be seen from the following table, showing the increase in the number of buildings, and of the valuation for ratable purposes, and consequent increase of risk, since 1891.

Year.	No. of buildings erected.	Valuation of city on 1st January of year.
1892	2,212	£737,816
1893	2,533	761,840
1894	2,538	792,127
1895	—	844,714

The present superintendent, Mr. Parker, reported that in his opinion a permanent staff should be appointed and the station rearranged. This report was endorsed by a special committee, adopted by the corporation, and a permanent staff appointed, which now numbers 50 men. The author was instructed to prepare the necessary plans for additional accommodation. The old station, opened in 1872, occupied a portion of the present site. It was found impossible to convert these buildings into a station suitable for the accommodation of a permanent staff, with the necessary facilities for prompt turn-out, &c.: plans for an entirely new station were prepared and laid before the corporation, who decided to erect it. The author and superintendent were directed to visit some of the larger towns in England and Scotland, so that advantage might be taken of their experience. The object chiefly in view was what to avoid. About twenty stations were visited, and without exception the men complained of their quarters being confined and unfit for the accommodation of families. Firemen's children, like our own, do not remain babies, and accommodation sufficient for a family of small children is quite inadequate when they grow up. For this reason we were told many good men have been forced to leave the service and forfeit their pension rights. The site of the new station is shown by old maps to have been at one time the foreshore of the river Lagan; at a later date it became the site of a dock, afterwards a market, and for 25 years past it has been covered with buildings. The excavation for the tower foundation is carried down 15ft. below the surface. The new station comprises dwellings for 25 men, with laundry and workshops, residence for superintendent, offices, duty-room, engine-room, gymnasium, quarters for single men, six-horse stables, hose-tower, boiler-house, and dynamo-room. The old buildings have been converted into stables, stores,

&c. The buildings inclose a drill-yard, and are arranged fronting three streets. The main buildings are in Chichester-street, which is 80ft. wide and a leading thoroughfare. At the left side of the frontage is the gateway leading to the drill-yard. It is made wide enough to admit a load of hay, and is the only entrance to the interior except through the engine-room or duty-room. The foundation is formed of piles and concrete. Larch piles 40ft. long, 12in. diameter at base, and 8in. at point, were driven down, and sawn off level; a layer of old roofing felt was placed on the bed of the trench to prevent the cement mixing with the sleetch. Wood was specified in first contract, but was found unsuitable, owing to the yielding nature of the bottom. Portland cement concrete was then filled in to the level of pile heads. Cross sleepers 12in. by 6in. were spiked to the pile heads, and concrete filled in to the top, then longitudinal sleepers spiked to these, and concrete brought up 6in. above their top edge. On this the footings of brickwork in cement are built to ground line. The superstructure is of perforated brick and mortar; solid Annandale bricks were used for the external facing of the engine-house block. There are 49 piles under the tower, and 490 under the remainder of the building. The engine-house occupies the main portion of the front, and is 65ft. by 35ft. in the clear, and 16ft. 6in. to the ceiling. It consists of five bays, each with a door 9ft. 3in. wide and 12ft. high, so that an engine can pass out at full gallop. The doors are framed in four leaves, glazed in the upper panels with plate-glass, having the city arms ground on. The engine-house is a clear span of 35ft., this width being absolutely necessary to give space for working round the machines inside. The floor and roof are carried by steel girders formed of two 16in. by 6 I joists, with ½in. plates riveted on top and bottom. The front wall is carried over grate openings by steel girders formed of three joists and plates. The facing of the piers is a brown glazed brickwork, with Castlewellan granite bases. A brass brick with screw plug is fixed in each pier, so that the gates can be left open, and a rope fastened across in summer to hooks, which take the place of the plugs. The bay next to the superintendent's house is screened off as a duty-room by a wall 5ft. high, above which is a clear glass screen rising to the ceiling. Here is fixed a clock with a dial on each side, so that the duty-man and engineer can note times of arrival and departure of machines or men. The walls are lined with enamelled bricks of various colours, and the ceiling is of pitchpine, varnished. The floor of the engine-house is of Dutch clinkers, laid diagonally. The stable floor is similar, but has 4in. granite cubes in the stalls. Immediately behind the engine-house is the stable. The stalls are arranged so that the centre line of each pair is opposite the centre line of a gate. The doors open into the engine-house, and are lined on the stable side with sheet-iron, and fitted with galvanised rollers at the angles, so that a horse rushing out cannot be injured. Teak rollers were used at first, but the horses destroyed them by their teeth. At one end of the stable a washing-place is provided, where horses and machines can be washed under cover; it is also lined with glazed bricks, and supplied with hot and cold water. Over the engine-room and duty-room the gymnasium and single men's quarters are located. The gymnasium is 39ft. by 35ft. by 16½ft. high. It is used as a reading and amusement room for the men, and a sleeping-room for the men on night duty. The flat roof of the stables forms a promenade for men off duty, and is the approach to the gymasium, &c. It is reached by a spiral staircase at one end. The flat roof of the gymnasium forms a drill-ground, and is also used as a promenade by the men. The tower is situate behind the duty-room. It rises 103ft. high, and combines a chimney from boilers, ventilating shafts from stables, engine-house, and gymnasium, wire passage, electrical test-room, and hose-drying tower. It can also be used for look-out purposes. The hose used in Belfast is in fifty-yard lengths, and can be hung up without a kink. The tower is approached by an outside spiral stair, and has a wrought-iron balcony all round, at level of testing-room. This enables the men to deal with the wires without risk. Hooks and pulleys are attached to balcony at one side for drying hose in open air. All telephone wires and fire alarms are received in a room at top of tower, from which they are led down a tube to the switchboard in duty-room. The quarters for married men are arranged round two sides of the drill-yard. Each house is complete in itself, and consists of kitchen, bathroom, lavatory, and one, two, or three bedrooms. They are so arranged that one room can be taken off any house and added to the adjoining house to suit the number of occupants. There are two-roomed, three-roomed, four-roomed, and five-roomed houses at present. Each house is on one floor—i.e., there are no stairs in a house. Those on the upper floor are approached by a balcony formed of concrete on steel joists, built into the walls, with an iron railing, and stairs at each end and centre. The laundry and coal vaults are in the centre of the block at the corner of Townhall and Oxford-streets. The workshop occupies two stories at the end next the engine-house. All the buildings are covered with flat asphalte roofs, so that they can be raised hereafter without disturbing the occupants. The roofs over the dwellings form a playground for the children, who are not permitted to run about the drill-yard. Each house is provided with a supply of hot and cold water. The hot water is laid on from a cistern placed on roof over the coal-vaults. A dresser is fixed in each kitchen. The sink is of enamelled earthenware, and is fitted with a wooden cover, which forms a table when not in use. The walls are plastered in Portland cement for 3ft. in height. The floors of the kitchen and bathroom are laid in red and black tiles in concrete. The bedroom floors are of wood. All are deafened. The laundry is arranged so that five families can use it at once. The fittings consists of five washing-stalls, each containing washing-tub, boiler, scrubbing-bench, and drying-horse (all screened off so that one person cannot see the clothes being washed by another), a hydro-extractor, washer, wringer, box-mangle, ironing table, and iron-heating stove. Hot and cold water and steam for boiling are laid on. The fittings are all by Messrs. Summerscales, Keighley. The workshop contains on ground floor a fitter's bench, coach-maker's hearth and anvil, drilling machine, lathe, and an 18H.P. vertical engine. The upper floor is used as a carpentry and painting shop. A travelling crane, capable of lifting 10 tons, is fixed to raise an engine to the upper floor, and is so arranged that if a fire-alarm is given it can be left in any position with safety. A boiler well is constructed on the ground floor. A drill balcony, 70ft. high, is erected at one side of yard. It is of timber, and represents two bays of six-story building. It is used for training the men to climb, use escapes, &c. The gymnasium is fitted with bridge ladder, scaling ladder, vaulting-horse, parallel bars, horizontal bars, dumbbells, rings, climbing ropes, &c. Boxes and tables to cover the apparatus are arranged round the walls, and form seats by day and beds at night for men on duty. Book-cases are at one end, and a piano occupies a corner. The floor is laid like a ship's deck, and caulked so as to be perfectly watertight. The whole area of the buildings is covered with Portland cement concrete, 6in. thick, and Limmer asphalte below the floors. The stable fittings are by Messrs. Musgrave. A brass rail is hinged at end of each stall to prevent the horse backing out. The heel posts rise to ceiling and support the girders. A ventilator runs the whole length of the ceiling. The channel is flushed by a concealed pipe in wall at one end. The system of electric bells is so arranged that the duty man can call any individual, or, by turning a lever, the whole staff at once. A sick man or one off duty can be left undisturbed. The station is lighted entirely by electricity, the current being generated on the premises. A very compact Lancashire boiler, made by Galloways, of Manchester, supplies steam not only to the engines for driving the dynamos, but also to a separate engine for the workshops, for boiling hot water in the cistern, which supplies each of the twenty-five houses, laundry, single men's quarters, and superintendent's house, and steam to the heating coils in duty-room, engine-house, gymnasium, &c. It is kept at about 40lb. pressure during the day, and 80lb., whilst the electric light is turned on to the whole station—i.e., to 11 p.m. The exhausted steam is used for heating the feed-water, which is pumped into the boiler by a Worthington pump, through a superheater. The consumption of fuel has been as low as 30cwt. per week, which the author ventures to think is remarkable, and is due to careful attention in firing. The dynamos are driven by two high-speed engines built by Mr. W. Malcolm, of Belfast. Each engine is capable of developing about 18H.P., but the average load is about 10H.P. for each. The dynamos, which are the production of the contractor for the electric light, Mr. J. H. Greenhill, of Belfast, are placed on the same bedplates as the engines, and are driven by belts from the respective flywheels. To avoid any risk of failure in the lighting either machine can be instantaneously connected to any particular circuit by means of a very complete double pole, double break "throw over" set of main switches, also made by the contractor. There are three main circuits, termed the "ordinary," the "all-night," and the "emergency," and these terms explain their purpose; the "emergency" being switched on when there is a call of fire. The switch-board is placed in the duty-room, and, although at first sight it appears very elaborate, it is in reality extremely simple to manipulate, and renders it totally impossible for a mistake to be made. It contains all the corporation's telephone wires, the direct fire alarms, bells to each apartment and dwelling in the station, electric light switches, speaking tubes, &c., also gauges showing the pressure of the town water supply and the electric light volts and ampères. In short, the duty man at the switchboard has control of the lights, bells, and telephones of the whole establishment, and the out stations as well. The ordinary lights are switched out at eleven p.m., but there is an additional switch for each lamp in the dwelling-houses and in other sections by which any lamps not required may be cut off. When the fire alarm rings the "emergency" switch is operated, and instantaneously the special lights in the fire-engine room, stables, single men's quarters, and one light in each of the married men's houses are illuminated, so that no delay occurs in any section from want of light. These "emergency lights" are controlled from switchboard only. The current is on the direct low-tension principle, and in addition to 170 incandescent lamps there are two very powerful arc lamps for illuminating the open spaces of the station. The general effect of the lighting is extremely fine, and it has proved to be very satisfactory after two winters' experience. The gymnasium and single men's bedrooms have polished steel shafting fixed as poles for the rapid descent of the men to the engine-house. The engine-house and stable doors are fitted with Try's patent fittings. A gaslight is hung at either side of each engine for igniting the lamps. The flames are mere specks until taken in the hand, when they enlarge to the size of No. 2 gas-burners. When released they rise above the men's heads and again diminish to small flames. The harness is suspended and becomes free on the weight being taken by the horse. At 11 p.m. all lights (except those known as "all-night lights") are turned out by the man on duty at the switchboard. The other men on duty lie down in the gymnasium on stretchers with rugs round them. On an alarm of fire being received, whilst the telephone is at his ear the duty-man turns one handle. This lights up the bedroom of every man, the engine-house and stable, single men's quarters, and gymnasium; then the bells ring, the men on duty slip down poles, the first man pulls the cord, releases the stable doors, the horses trot out, passing under the harness, the driver takes his seat, the engineer sees that all is right and pulls the cords, releasing the doors, and in less time than is occupied in describing it the first machine is off, only fifteen seconds (on the average day and night) having been occupied between the receipt of the alarm and the engine responding. Immediately another machine, men, and horses take the place of those gone out. Of course, if the fire is an entensive one more machines follow. In planning the buildings the points kept in view were convenience and economy in working, facilities for prompt turn-out, comfort of men, and provision for future extension without undue interference with the working of the station.

The foundation-stone of the new grammar school for Southampton, now in course of erection on the West Marlands, was laid on Monday week. It is the third schoolhouse erected for the charity during the past three-quarters of a century. The first, built in 1821 at a cost of £1,200, was replaced in 1874 by one erected at an outlay of about twice that amount. This, in turn, has become inadequate, and the school now being constructed will cost £6,650, and with master's residence and grounds £9,730. Mr. A. F. Gutteridge, of Southampton, is the architect, and Messrs. Playfair and Toole, of the same town, are the contractors.

"OLD MASTERS" ON THE CONTINENT.—XXIV.: "CHRIST AT THE HOUSE OF SIMON THE PHARISEE."

This painting, by Jan Gossart, usually called Mabuse, is now in the Royal Gallery at Brussels. Its painter was born about the year 1470 at Maubeuge, in Hainault, and he died in Antwerp in 1541. Records tell little concerning his history; but in the earlier years of his career he adopted the methods of his Flemish contemporaries, whose designs he soon surpassed, and it is certain that he visited Italy while he was still young. "The Adoration of the Kings," at Castle Howard is an elaborate and splendid example of his work at this time, when he was under the influence of Memlinc and the style then prevalent in Flanders. Mabuse rivalled the work of Memlinc for depth of feeling and conscientious finish of detail, and he severely competed with Gheraert David for the true spirit of religious sentiment exhibited in his works, while for warmth and excellence of colouring, his freshness of effect, no doubt, exceeded either of these famous masters. The "Enthroned Madonna" at Palermo and his "Madonna by the Fountain" in the Ambrosiana at Milan, are attributed to the same period with some others from his pencil; but the "Adoration of the Kings," already mentioned, is probably the finest of them all. Mabuse was probably the first among the Flemish masters to introduce the nude into his compositions. In 1508 we read of his going to Italy in the train of Philip the Bastard, of Burgundy; but the endeavour conspicuous in his compositions which he then designed, evidently intended to combine his native style with Italian art, are not to be reckoned as satisfactory, for the results were not altogether happy. The absence of conviction and feeling mars their labour engendered by his new fancy, which had so little in common with the early associations of his life's work. Notwithstanding this comparative failure on the part of Mabuse, it is perfectly clear that he had not ceased to produce paintings of unquestioned ability and striking skill, such, for instance, as that which we illustrate to-day, or his great altar-piece in the cathedral of Prague, wherein, in a palatial interior of a Renaissance building, St. Luke is represented drawing the portraits of the Blessed Virgin and the infant Christ. Mabuse, too, was one of the illuminators of the celebrated Grimani Breviary, preserved in the Library of St. Mark at Venice. At Vienna, Brussels, Munich, Antwerp, and other places in Belgium specimens of his work are to be seen, and there are two portraits of his in the National Gallery. One, a "Man Dressed in Black with Fur over his Shoulders," was purchased at Paris in 1860. He has a rosary in his hand, and appears to be standing in a church, as shown by the architectural background. The second picture is of a man holding his gloves in his left hand, his right resting on the table. He wears a gown furred with sable, and a flat cap. The work was a Wynn Ellis bequest in 1876. At Hampton Court there is a group by Mabuse of the children of Christian II., King of Denmark, and the likeness of Cardinal Carondelet in the Louvre should be mentioned. After returning from Italy he was largely employed throughout the Low Countries. His colouring remained fresh and clear, and his works are as neatly finished as a Mieris or Douw. His form of signature was generally "Johannes Malbodius."

NEW MUSEUM AND CONCERT HALL, SOLOTHURN.

(See description and further sketches on p. 368.)

PORTE DE BAUDETS, BRUGES.

This, one of the several interesting and picturesque gateways built to defend the bridges over the outer canal which surrounds the city, is probably of the 14th century, with later additions to the upper story. The circular apartments on the ground floor to the drum towers flanking the gateway have fine groined ceilings.

THE WEAVERS' HOUSE, GHENT.

This house, situated at one corner of the Vrizdagmarket or Marché du Vendredi, is a very well-proportioned and striking example of domestic architecture of apparently the 17th century; a very striking feature being the cylindrical turret at the corner. Some parts of the upper stories seem to have been added at a later date.

Ernest C. Bewlay.

[These two sketches are the last remaining unpublished from those for which prizes were awarded in the competition which we held in connection with the Building News for Drawings executed with a view to the Picturesque rendering of Architectural Subjects. Mr. Bewlay's sketches are bright and effective, without any loss of information of value to the architect.]

THE STAIRCASE, "GODDINGTON," CHELSFIELD.

This house, of which we gave an exterior view from the architect's Royal Academy drawing in the Building News for May 5th, 1893, has been erected for Mr. A. Miller Hallett, with parts of a smaller building incorporated in the new work. A special feature is made of the hall, from whence the fine oak staircase, which we now illustrate, leads up to the top of the house. This work is entirely of wainscot, and every care has been taken to insure good detail throughout. The general contractor was Mr. Thomas Crossley, of Bromley, and the oak parquet work was executed by Messrs. Howard and Sons. The electric-light was furnished by Messrs. Drake and Gorham. Mr. W. West Neve, of Bloomsbury-square, is the architect.

HALL STAIRCASE AND GALLERY TO COUNTRY HOUSE.

This elevational design, by Mr. W. H. Ashford, gives details of an entrance hall to a large country house, the hall on ground floor giving access to principal reception rooms, and on the first floor, by means of the gallery, furnishes the approach to suites of bedrooms. The materials are light wainscot oak for the panelling and general framing, with teak introduced for newels, balusters, handrails, &c. The upper portion of the walls of the hall are shown to be faced with, or built of, Corsham Down stone.

BELFAST FIRE BRIGADE STATION.

(See descriptive article on page 369.)

* * *

The contractors' estimates for building the remaining portion of the new aqueduct nearest to Loch Katrine were opened by the Glasgow Water Committee on Monday. It was found that the amounts ran from £40,450 to £58,480. The estimates were remitted for examination.

Colonel Yorke, R.E., held a public inquiry at the Barry Hotel, Barry, on Monday, into the circumstances attending the late fatal disaster at Aberthaw, on the line of the Vale of Glamorgan Railway, which is in course of construction by Messrs. Pethick Bros., the engineers of the works being Sir J. W. Szlumper and Mr. T. Forster Brown.

An International Technical Congress met at Zurich on Monday, for the purpose of arriving at an agreement securing unity of methods in the testing of building materials in all European countries. The United States were also represented, and Mr. Hennings, a New York engineer, was elected an honorary president.

COMPETITIONS.

Great Ayton Main Sewerage.—The parish council of Great Ayton, and the chairman of the district council, acting together as a parochial committee, have had under their consideration the subject of a system of main sewerage for the village. They offered a premium of 25 guineas for the best scheme, and in response the following engineers entered into competition, viz.:—Mr. H. W. Taylor, Newburn-on-Tyne; Mr. F. Beasley, Westminster; Mr. H. Bertram Nicholls, Birmingham; Mr. W. Spinks, Leeds; and Mr. R. E. W. Berrington, Wolverhampton. Mr. T. W. Stainthorpe, A.M.I.C.E. (the engineer and surveyor to the Eston Urban District Council), was appointed as assessor on the five schemes, and after paying a visit of inspection to the village, he recommended that the premium should be awarded to the competitor under the *nom de plume* "Salus," who afterwards proved to be Mr. H. W. Taylor, P.A.S.I., of Newburn-on-Tyne. Mr. Stainthorpe's report was unanimously adopted by the parochial committee, and Mr. Taylor's scheme, at an estimated cost of £2,990 (including Ives' patent system of filtration), will, after obtaining the sanction of the Local Government Board, be carried out with as little delay as possible. The village of Great Ayton, with a population of some two thousand, stands on the Leven, a small tributary of the Tees, near the head of the Cleveland Valley in the North Riding. It averages about three hundred feet above sea-level, and is one of the few villages that can boast of two greens, the area and character of which have been uninterruptedly maintained since the reign of James the First. The quaint little chamber where the parish council holds its meetings, and where the school plans were adjudicated upon, is the room where Captain Cook, the circumnavigator, received his education.

Skelmanthorpe.—Twelve sets of plans were submitted in competition for proposed new Wesleyan chapel here, and after several meetings the trustees selected those sent in by Mr. J. Berry, architect, 9, Queen-street, Huddersfield, who has since been engaged to carry out the work.

* * *

CHIPS.

The town council of Rochdale have finally passed and adopted a revised code of building by-laws, of greater stringency than that hitherto in force.

The memorial stones have just been laid of new schools to be added to the Baptist Chapel at Small Heath, Birmingham. The main room will be 60ft. by 31ft. 6in., and there will also be five class-rooms. Mr. Hougham, of Small Heath, is the contractor.

A noteworthy change has just been effected in the appearance of the High-street of Kirkcaldy, at White House, the residence of the late Mr. John Fergus, for many years M.P. for Fifeshire, and where Carlyle was a frequent and welcome visitor. A high wall which inclosed the grounds formed part of the thoroughfare for some distance, and the trees behind formed a pleasant feature in the vista of the street. The house remains, but wall and trees and everything else are gone, and a row of shops is being built on the site. A 17th-century edifice of very irregular construction, at the opposite side of the street, is likely to be acquired by the Government as a site for a new post office, and another corner at the foot of the Kirk Wynd has just been appropriated for the Swan Memorial Hall and Young Men's Christian Institute.

On May 1, 1896, there will be opened in Berlin an Industrial Exhibition of the first rank. More than 5,000,000 marks have been subscribed to the guarantee fund, and 5,000 exhibitors have engaged room. Round about the main building, which has a capacity of 60,000 square mètres, are grouped about 50 others, some of them being of very considerable dimensions. These buildings are set apart for special exhibits, of which there are 23 groups. Sheets of water, on the same lines as in Chicago, will be introduced into the exhibition, and will be made to combine with picturesque landscapes, and electric and elevated railways have been laid down between the city and the exhibition, which is situated at Treptow Park, on the Upper Spree, at a point where it broadens into several lakes.

The report of the Sheffield General Infirmary, presented at the annual meeting on Friday, stated that plans had been prepared for providing better accommodation for nurses; but it was felt that it would have been inopportune to put the scheme forward during the past year. Steps must, however, now be taken to mature the plans, and to appeal to the public for funds to carry them through.

Building Intelligence.

The Admiralty Offices.—The occupation of the new Admiralty Buildings will commence in a few days by the transfer of the chief engineer's department to its quarters on the top floor. The other departments will rapidly follow, for the whole edifice, which has been over five years in hand, has been practically ready for the past two months. The architects are Messrs. Leeming and Leeming, of Victoria-street, Westminster, who won the work in competition, by whom the drawings also were personally made. The contractors were Messrs. J. Shillitoe and Son, of Bury St. Edmund's, and the works have been carried out under the control of Her Majesty's Office of Works, exercised through their surveyor, Mr. John Taylor, C.B. The materials employed are red Fareham bricks, and Portland stone from the Weston quarries, which harmonise well with the old buildings. The new block is separated from the older buildings by a quadrangle, the two communicating on the south side by an open colonnade, by a wide path on the ground level, and by a subway. At the northern end, the quadrangle will ultimately be bounded by a block of further buildings, the drawings and quantities for which are now being got out. The new block thus extends further by 260ft. into the park. The new block, on its side next the quadrangle, is in accord, in its architectural details, with the original building. But its south and west faces, although more freely treated, are necessarily confined to a height of four stories, and an elevation of about 60ft. from the ground level to cornice. The grand entrance will be in the northern block, when that is erected, and will be surmounted by a dome; but the principal stairs are now at the south-east angle of the new block, leading first to the south corridor on the ground floor, running east and west, from which two long corridors run northward, having rows of offices on one side and two long central open courts between them, each 80ft. long and 25ft. wide, extending the whole height of the edifice, and affording excellent lighting and ventilation, the walls being covered with buff glazed bricks, with colour courses. The entrance to the stairs is from the Mall under a tower capped by a lead-covered domical cupola rising 75ft. above the main buildings, or 140ft. from the ground. This tower contains a tank for a supplementary water supply. The stairs as they ascend communicate with similar corridors and rows of offices on the first, second, and third floors, above which the corridors are lighted from the dormers, and the offices from the inner courts. The offices for the high officials are on the ground floor, with the exception of the First Lord's room, which is on the first floor. The naval constructor's and draftsmen's offices are on the third floor, the lighting of which is admirably adapted for its intended purposes. Below the ground level there is a sub-ground floor for clerks' offices, and under this a basement wholly covered in and divided off into numerous repositories and stores. The engine-room, pump, and boiler-rooms are placed outside the building in an underground station, with provision for steam supply for the heating services. The new block is practically built in a dry dock, for the reason that the foundations, being carried down into the solid clay, have passed the water-level of the soil by some 12ft. or 14ft., necessitating the dry-dock arrangement referred to, the walls of which are asphalted and made impervious. The north and south offices, and the central sanitary arrangements, added to the length of the open courts, give a total length of over 300ft., the extreme breadth from wall to wall being 100ft. Altogether, there are over 150 offices, all of which communicate with the messenger on each floor by a telephonic system. The electric light is employed, and gas altogether excluded. All the floors are of Fawcett's fireproof construction. The entire cost will be about £215,000. Illustrations of the Offices have appeared in the Building News for April 6, 13, and 20, and Oct. 5, 1888; and Feb. 20 and March 13, 1891.

Cardiff.—The extension of the Free Library at Cardiff is approaching completion, the hoarding having been removed from the frontages to the Hayes and Trinity-street, although the Working-street façade is still inclosed. Mr. Edwin Seward, R.C.A., of Cardiff, is the architect. The sculptural and carved work is being executed by Mr. William Taylor, representing Mr. W. Clarke, sculptor, Llandaff. This work includes two seated female figures, one-fourth life size, facing the main entrance in Trinity-street, and executed in Portland stone, and between them the coat of arms of the borough. A series of carvings is carried round the façade illustrative of the early marks of the great European printers. Many of these have been supplied from a collection of early specimens of printing and printers' marks formed several years ago by the architect, and from which Mr. Taylor has made reproductions. The series commences with the devices of William Caxton, the first English printer, and his successor, Wynkyn de Worde. There are also the serpent and olive branch of Robert Estienne, of Paris; and the Pegasus of André Wechel, the Globe of the Elzevirs, of Amsterdam and Leyden, and the twin shields and monograms of Fust and Schoeffer, the first printers; the Aldine anchor and dolphin of Venice, the hand and compasses of Christopher Plantin, of Antwerp; and the Adam and Eve of Phillipe de Giunta, of Florence. Most of the carvings are in white Portland stone; but yellow Ham stone has also been used in places, whilst the whole of the fronts are, otherwise, of Bath stone from the Combe Down Quarries. The Hayes front is crowned by a colossal bust of Minerva.

Scarborough.—Memorial-stones of a new Sunday-school about to be built at the rear of Westborough Wesleyan Chapel, were laid on Tuesday. The building fronts to Belle Vue-parade. It will consist of a central hall, 46ft. by 46ft., with galleries on three sides, three classrooms, about 11ft. by 13ft. 6in. each; a young men's room, 24ft. by 18ft. 6in.; and a book store on the ground floor, and five class-rooms on the first floor, one 19ft. by 12ft., and four about 11ft. 6in. by 13ft. 6in., which latter can be thrown into the gallery when needed. In the basement lavatory accommodation for both sexes will be provided. The boys' entrance will be on the western and the girls' on the eastern side of the building. Each will have an outer lobby, and an inner lobby communicating with the northern end of the chapel; also staircases giving access to the first-floor classrooms, the gallery of the central hall, and the chapel galleries. There will be a third entrance in Belle Vue-parade communicating directly with the young men's room. The elevations will harmonise with the chapel, and outside facings will be buff pressed bricks, with dressings of Cloughton stone. The central hall will have an open wood roof, ceiled at the collar-beam. The architect is Mr. William Watson, Barstow-square, Wakefield, and the contractors, Messrs. Bastiman and Sons for the bricklayers', masons', and plasterers' trades, Mr. Joseph Hargreaves for slating, Mr. Geo. Scales for carpenters' and joiners' work, Messrs. Thos. Craven and Son for plumbing and glazing, Messrs. Appleby and Brogden for ironwork, and Mr. Harry Jackson for painting, all of Scarborough. The contracts amount to £2,500.

Wembley.—Contrary to the popular notion, the erection of the Tower at Wembley has not been abandoned, but is making slow, but steady, progress. During the earlier phase of the undertaking, the four huge steel legs, reared diagonally to support the lofty edifice which is ultimately to be raised upon them, had to be shored and maintained artificially in their exact positions until the permanent steel ties were erected and the temporary stays removed. These works have now been completed, and the first section of the tower, with its platform of an acre in extent, at an elevation of 150ft. above the surface of the ground, is now finished. All the girders, weighing 28 to 30 tons apiece, for carrying the flooring, have been raised to this level and set in position, and are now being concreted over for the service of visitors. This lofty platform is only accessible as yet by the open lift used by the workmen in their various operations, but will be opened for public entertainment in the coming year. The underground chamber, 20ft. deep, is also ready to receive the powerful engines which have been designed for working the mechanical lift. These will raise freights of 70 passengers at a time to a height of 900ft., when the top platform shall have been finished. There will be then still another pinnacle above, rising to a height of 1,150ft. The engines, for which the bed-blocks and bolts are already laid, will work the lifts by steel wire ropes passing over four grooved pulleys next the engine, and single grooved pulleys at the point of highest elevation. The cages will travel in vertical guides, and will be balanced by counterpoises, hydraulic buffers being provided to prevent over-winding. The site of the boilers is some distance away from the Tower, and steam will be led from them in pipes to the engine-room. The Tower works are under the charge of Mr. Gilbert, the resident engineer for the contractor, Mr. Heenan.

Worksop.—The new college, forming one of the Woodard schools, was dedicated on the 4th inst. to St. Cuthbert by Dr. Riddings, the Lord Bishop of Southwell. Although the whole of the fabric is not yet completed, enough provision has been made to accommodate 200 boys. The college stands on Sparken Hill, about a mile from Worksop, and has been erected from plans by the architects to the society, Messrs. Carpenter and Ingelow. The buildings will be grouped round a large central, closed quadrangle, 170ft. square inside, and entered by an arched gateway in the centre, where will be the porter's lodge. Facing the entrance on the other side of the grassy quadrangle will run cloisters, passing the great schoolroom, while there will be dormitories above, and classrooms and dormitories below. Towards the east will project the chapel, and on the west is the dining-hall. Of all this something less than half is already finished. A portion of the quadrangle and the dining-hall stands ready, while a temporary chapel has been built for present use. The fittings have been designed by Mr. Kempe, with a view to their suitability to their future worthier abode. The walls of the dining-hall are of warm-coloured brick, and the hammer-beam roof is of pine, unstained and unvarnished.

CHIPS.

One of the most extensive undertakings yet promoted on behalf of a parish council is the scheme for a public water supply for the parish of Purton, to be carried out under the provisions of the Public Health Act, 1875. The scheme has been prepared by Mr. J. R. Shopland, C.E., of Swindon, is estimated to cost about £1,000, and when completed it will provide water for about 120 houses.

Mrs. Carr-Gomm, lady of the manor of Rotherhithe, will lay the foundation-stone of the new town hall for Rotherhithe on Tuesday next, the 17th inst. The building, which is being erected in Lower-road, with side frontages to Neptune and Moodkee-streets, will be Italian Renaissance in style. The architects are Messrs. Murray and Foster, whose design was selected in a limited competition in February last.

St. Anthony's Church, Padua, is being restored. The chief work is the reconstruction, according to the original plan, of the famous altar of Donatello, of which the fragments and figures in bronze have for a long time lain scattered about the church. The exterior of the church was illustrated by a double-page perspective in the Building News for January 20, 1891.

The new clock and chimes placed in the tower of the municipal buildings in course of erection at Croydon have now been put into operation. They have been constructed by Messrs. Gillett and Johnston, of Croydon, and are the gift of the mayor (Alderman Edridge), and cost a thousand guineas. It is anticipated that the new municipal buildings, which are being erected on the site of the old Central Railway station, from designs by Mr. Charles Henman, will be opened early in the spring by the Prince of Wales. We illustrated the buildings, which are Renaissance in style, and of red bricks with Portland-stone dressings, in the Building News for June 3, 1892. The cost has been £140,000.

The first sod of the Barnstaple and Lynton Railway will be cut on Tuesday next, the 17th inst. The line will be over 19 miles in length, and of the narrow gauge of 3ft.; it will form a junction with the South-Western system at or near the present Barnstaple Station, which will then be reconstructed.

The dulness of holiday time again prevailed at the Auction Mart last week. The supply of properties was small, and, with the exception of a brewery at Lewes disposed of on the Monday for £16,100, the demand limited.

The parish kirk of Auchtertool, Kirkcaldy, was reopened last week for public worship after extensive alterations, which included the removal of a gallery, the reseating of the church, the introduction of hot-water pipes, and the providing of communion and other church furniture. A stained-glass window, by Messrs. Ballantyne and Gardiner, Edinburgh, has also been placed in the church.

During Sunday night the West Bromwich Theatre, which has recently been improved and altered to seat about 2,000 persons, was completely destroyed by fire, nothing but the bare walls being left. The outbreak originated in the room of the manager of a refreshment business connected with the theatre.

LONGITUDINAL SECTION, THEATRE ROYAL GLASGOW. RESTORATION OF AUDITORY AND STAGE.

C. J. Phipps, F.S.A., *Architect.*

THEATRE ROYAL, GLASGOW.

THIS theatre, opened last Monday by Mr. Geo. Alexander's company from St. James's Theatre, has been designed by Mr. C. J. Phipps, F.S.A., architect, of London. The internal arrangements of the building, together with the entrances and exits, remain exactly as they were in the theatre that was burnt last March. Briefly, it may be said that there is an entrance and exit to each division of the audience on either side of the theatre. The ground floor, level with the street, is occupied as before, with stalls and pit. The stalls are entered by the vestibule in Hope-street, and will have seven rows, accommodating 170 persons. The pit comes behind, and is enlarged to the extent of some 8ft. or 9ft. from front to back; this space has been taken off the stage, which in the old theatre was unnecessarily large.

The first tier, entering from the vestibule by the principal staircase, is occupied by a dress-circle of five rows and a family circle behind of six rows. The dress-circle accommodates 166 persons, and the family circle 158. The back wall of the circle is arranged in a series of arcades filled in with glass, so that persons standing in the corridor may see the stage without going into the auditorium. There are five entrances to this tier from the corridor. Both here and in the stalls the seating is in armchairs with turn-up seats covered in frieze velvet.

The refreshment-room is at the back of the corridor; but the position of the counter has been somewhat altered, affording more accommodation for the public, and less chance of sound being heard in the auditorium. The proscenium has three private boxes on either side, one on the stalls level, one on the dress-circle level, and another on the upper-circle level. There are also on the dress-circle level three private boxes on either side behind the first row, all of them admirably adapted for perfect sight of the stage. The second tier is occupied by the upper circle of nine rows, with the refreshment saloons and other accommodation as before. Above this, on the third floor, is a very spacious gallery raised at the sides, and the curve of the front of this tier is so designed that there is not a single seat in the gallery that has not a full and perfect view of the stage in every part without the necessity of anyone standing up or leaning over. This gallery has seating accommodation for some 700 or 800 persons. The stage is of ample depth for the production of any class of drama or pantomime, being 42ft. in depth by 72ft. in width. In addition to this, there is ample storage at the back in a separate dock for stowage of scenery.

One very important part of the construction of this theatre, which has never before been attempted, is that there are two proscenium walls, 10ft. apart, and following somewhat the lines of the pillars in the proscenium boxes; these walls are carried right up, and the stage roof and the auditorium roof are thus entirely distinct, and separated with a clear space of 10ft. between them, there being also a fireproof roof formed immediately above the proscenium arch. This arrangement is shown by the accompanying section, which we have reproduced from the architect's drawing for this purpose.

The stage opening is filled with a fire-resisting curtain worked by hydraulics. This curtain is so constructed of iron framework, on both sides of which are fixed asbestos boards, ¼in. thick, in sections; the space thus formed between these boards is filled in solidly with silicate of cotton, so that both a fire-resisting and a heat-resisting curtain is provided, and the architect maintains, with this curtain down the stage might be burnt out and the auditorium remain intact, there being now no continuity between the two.

In addition to this, water from the high-pressure mains is laid on, with hydrants on every floor of the theatre and on the stage.

The stage itself is constructed with every mechanical contrivance, and will be lighted entirely by the electric light; gas is not laid on to any part. This means an immunity from danger which cannot be equalled, and with the fire-resisting curtain and the two proscenium walls it is hoped that this theatre may have a long life.

The dressing-rooms have been very much enlarged, a new house behind the stage in Hope-street having been included in the present scheme. All staircases and passages to and from them have been reconstructed in iron and concrete, for, although the late fire did not destroy the dressing-rooms, it was thought advisable to improve them in every particular.

The dimensions of the new theatre are as follows:—

	ft.	in.
Curtain line to back of pit	76	6
Ditto ditto front dress-circle	44	0
Ditto ditto upper circle	50	0
Ditto ditto gallery	53	6
Ditto ditto back wall stage	42	0
Width of stage	72	0
Ditto proscenium opening	34	0
Height ditto ditto	29	0
Ditto stage to gridiron floor	59	0
Ditto pit floor to ceiling	50	0

The ventilation has been considered so as to get fresh air without causing draughts. In the centre of the ceiling is a sunlight of novel construction, being the first of the kind ever put up, it being a new patent. Immediately above it are two iron flues leading through the roof into the open air, so arranged that there is no possibility of a down-draught, but simply an up-cast. This sunlight is quite as much for ventilation as for lighting, and it will act equally as well when only turned down to one ring of lights; its object is to act as an extracting flue. Flues from the gallery ceiling also lead into this centre ventilating flue, and while fresh air is brought in through proper channels, precautions have been taken by the erection of additional doors in passages to prevent draughts.

The lighting of the theatre being mainly by electricity, which is placed not only round the box fronts, but in the interior, it has been found necessary in practice at all theatres to have a means of warming. This is provided here by hot-water pipes with radiators on either side of the house on every level. Thus the air in the corridors will become warmed before passing into the auditorium. The furnaces for working this heating are placed in chambers in a building behind the stage.

The whole of the ceiling, with the box-fronts, proscenium, &c., are made in fibrous plaster by Messrs. Jackson and Sons, of London, the patentees. The scheme of colour is white and gold. The walls are papered with a rich, deep terracotta red. The hangings of the private boxes are of cherry-coloured plush, and the linings to the walls of the boxes are of orange-yellow. Over the proscenium, in the tympanum formed by the arch, is a painting by Ballard, of London, representing "Apollo and the Nine Muses." The seats in the stalls, dress, and family circles are of peacock blue, with dark red carpets.

The following are the names of the various firms who have been associated with the construction of the theatre:—Morrison and Mason, general contractors, have done the excavating, bricklaying, and mason's work, with the following sub-contractors, all of Glasgow: carpenter and joiner, James Morrison; plasterer, R. A. McGilvry; painters, John Orr and Sons; plumber and gasfitter, W. Anderson; glaziers, W. Meikle and Sons. Fibrous plaster-work, G. Jackson and Sons, London; painting, decorating, and gilding, Edward Bell, London; heating and warming, James Coombe and Son, Glasgow; armchairs in stalls, dress, and family circles, C. Wadman, Bath; sunlight, Strode and Co., London; electric lighting, C. Hamilton and Co., Glasgow; upholsterers' work and carpets, Patterson Bros., Glasgow; fire-resisting curtain, E. and E. Taylor, London. Mr. Andrew Cavers has been clerk of works.

BOOKS RECEIVED.

Modern Wood-Working Machinery, by J. STAFFORD RANSOME, Assoc.Mem.Inst.C.E. (London: William Rider and Son, Ltd., Bartholomew Close).—The author of this volume of the useful Technical Series published by this firm is a specialist in wood-working machinery. The present book has been remodelled upon the author's former work, and brought up to date, and the illustrations of machinery are increased. The author has adopted a popular style, and his effort has been to give intending purchasers of wood-working machines general information to guide them in selecting desirable types. The possessor of the most perfect machine is in a position to make the highest profit. Inferior machinery entails repairs, unnecessary labour, and other drawbacks. These are points which Mr. Ransome forcibly dwells upon, as well as the need of a properly organised system. As to the prices of machines, these vary greatly, owing to ma[illegible] same names for machines used for widely different purposes. It is shown that mortising machines vary from £7 to £250, but one is used for light joinery, the other for heavy waggon railway work. Again, the heavier made machines do not always wear the longest, as every pound of metal in excess is a fault, especially in a working part. Some very useful suggestions are made as to these and other points. Easy means of access to the saws, cutters, tools, &c., are essential, as every minute that a machine is standing still means a loss of money. The author very justly remarks: "In making choice between two machines, it is very important to ascertain, not only how many feet of work each will do per minute, but how long, and how many times a day, each will have to stand idle while saws or cutters are being changed, sharpened, and adjusted." The author brings his practical experience to bear on various questions, such as prices and estimates, foreign machinery, second-hand machines, motive power, tree felling, handling logs in yard and mill, saw-frames, band-saws, cross-cut machines, moulding, boring, and mortising, tenoning, dovetailing, and other machines. Of motive powers water is said to be the cheapest. Gas-engines, like the "Otto" are serious competitors of steam-power, they do not require a constant attendant or boiler, require no carting of fuel, &c. All wood-workers, contractors, and manufacturers will find this handbook of great value in selecting and managing their machines. Many of the technical points in working are described, and the construction of the best types of machines are explained and illustrated by clearly-drawn engravings. The remarks on sharpening and setting saw-blades and other tools are worth attention.——*The London Building Act*, 1894, by R. CUNNINGHAM GLEN, M.A., LL.B., Barrister-at-Law, and ARTHUR A. BETHUNE, Barrister-at-Law (London: Knight and Co., Fleet-street), is another textbook of the new Building Act and the re-enacted provisions of the old Acts, of which books we have lately noticed several. Messrs. Glen and Bethune have produced a more complete work than we have yet seen. It contains the text of the London Building Act, 1894, with notes and decisions, besides the statute law relating to the formation and construction of streets and buildings within the Metropolis, and four appendices containing the enactments relating to the City; the standing orders of the L.C.C. by-laws, and regulations of the Council relating to streets and buildings; by-laws under the Public Health (London) Act, 1891; regulations and standing orders of the Commissioners of Sewers relating to the City; also forms in use by district surveyors under the Act of 1894 and under the by-laws of the Act, and the instructional letters issued by the Metropolitan Board of Works to district surveyors, and that of the L.C.C. These statutes, regulations, and instructional letters are of great value to the architect and surveyor in the Metropolis, as they throw much light on questions such as "new" buildings, &c., which are not clear in the Act itself. Not less useful are the series of diagrams in the last appendix, illustrating those sections of the new Act which relate to open spaces at the rear of buildings, courts within a building, minimum height of habitable rooms, height of building on a corner plot, recesses and openings in external and party walls, heights of parapet above gutter, chimneys, thickness of external and party walls in schedules, &c. These illustrative diagrams have been prepared by Mr. Alfred Conder, F.R.I.B.A., F.S.I., district surveyor of Woolwich. To the practical reader, the architect, and builder, these diagrams will be found of much value in explaining rather obscure sections. In one section, of court within a building, the word "height" should read *width*. The text of the Act is clearly printed, with marginal headings, and the notes, printed in a smaller type, are full and copious. The Act itself, although it consolidates and amends the enactments relating to streets and buildings, does not give the student all the statutory provisions which have reference to them; this work supplies the want by collecting them all, so that the real state of the law may be found on any given point without having to refer to numerous other acts and provisions. In the notes this connection is kept in view by the authors. A very comprehensive index is given. To the architect and surveyor, as well as the lawyer, this work will be found an invaluable textbook of Metropolitan Building Law.

APPLIANCES FOR GIRDER ERECTION.

THE writer on Girder Erection in *Indian Engineering* describes the advantages which an Imperial Government can afford in the provision of appliances in themselves costly, and wanted but once during the construction of a single work. The apparatus required in the erection of bridge girders is a particular case. Special machinery is necessary. The writer observes: "In building long girders two alternative methods are open to the engineer, whose duty it is to decide upon the course he proposes to follow when effecting their erection. A temporary staging may be constructed, and the ironwork built up in its final position on this platform, or the girders may be put together on the ground, and, when complete, lifted or swung, as the case may be, on to those piers which are to support the finished structure." The first method entails the disadvantage of having a cramped space to work in for the riveting and manipulation of the members, the second method is to be preferred, but powerful lifting machinery or heavy swinging shears have to be provided. As the writer points out, these appliances have to be specially designed and constructed for each large work, and although such apparatus may prove useful for other undertakings, as a matter of fact it is seldom adopted, owing to some peculiarity in the new work. Reference is made to Mr. Deane's paper describing the erection of the Anas Bridge girders on the Godhra-Rutlam Railway. If the appliances for lifting girders built below were designed with due consideration for portability and adjustment, they might be kept for other similar purposes of erection. In India these appliances are constructed only for the special wants of a particular erection, and are therefore roughly put together and not adapted to be used for other constructions. The author justly thinks that the maintenance of really suitable appliances would be a distinct advance on the present rough and ready methods in use in India. The construction of portable hydraulic lifting apparatus or movable shears and gantries might surely be undertaken by the manufacturing engineer adapted for countries and new colonies where bridge and other structures are required. Travelling platforms and scaffolds are made, and these, if constructed of iron and capable of being taken to pieces in sections, could be easily re-erected in positions where girder bridges are to be erected. A considerable saving in the cost of executing engineering works would be effected by such portable appliances.

CHIPS.

A new Primitive Methodist chapel and schoolroom were opened at Scalby, near Scarborough, on Friday. The architect is Mr. J. Caleb Petch, of Scarborough.

Alterations are being made to the Town-Hall, Bridport, embracing the ventilation, which will now be carried out on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air, while fresh air is admitted through their improved air inlets.

The new schools, West Bromwich, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The extension buildings of the Record Office in Chancery-lane will be opened by the Prince of Wales in November. The buildings, which were illustrated by plans and a perspective in our issues of Jan. 6 and 13, 1893, have been erected from designs by Mr. John Taylor, C.B., of H.M. Office of Works, at a cost of about £80,000.

Wavertree Recreation Ground, presented to Liverpool by an anonymous donor, and representing in value nearly £70,000, was opened with great *éclat* on Saturday.

Lord Wodehouse, who was recently fined for committing an assault on Mr. John Gaymer, the well-known ecclesiastical builder of North Walsham, in the course of an election for East Norfolk, has been removed from the Commission of the Peace.

Like the neighbouring parish of Marylebone, the St. Pancras vestry are substituting wood for granite sets and macadam in remaking the roads under their control, and most of the leading thoroughfares in St. Pancras have now been paved with wood. The hard and non-absorbent woods are now being mainly used.

The University of St. Andrew's is building a hall of residence for [illegible] women students on the lines of the Girton and Newnham Colleges at Cambridge, and the Oxford Halls for Women. The architect and the warden have visited the principal colleges and halls for women students in England, with the view of seeing their most recent developments.

The amalgamation of the Irish Land Agents' Association with the Surveyors' Institution of England being now an accomplished fact, steps are being taken for a similar expansion of the great professional organisation in Scotland, to be accompanied by a scheme of examinations adjusted to the conditions in that country.

A home for ladies in reduced circumstances from Brixton and Stockwell has just been built by Mrs. Buckmaster at Broadstairs. It will accommodate twelve residents, and is Queen Anne in style, the walls being of red bricks with tile-hanging on the first floor and timber-work and plaster in the gables. The roofs are tiled, and in the centre is a low belvedere with circular lead roof. Mr. E. Dewar Matthews, 11, Waterloo-place, S.W., was the architect, Mr. H. F. Sheppard the clerk of works, and Messrs. Wise, of Deal, were the contractors. The furnishing has been carried out by Maple, of Tottenham Court-road, while the heating and ventilation has been undertaken by Jeffreys, of Old Queen-street, Westminster. The opening ceremony took place last week.

Mr. Edward Charles Bursell, a sculptor, who has been resident in Cardiff for some fifteen years, committed suicide by cutting his throat at his residence in Glenroy-street, Roath, Cardiff, on Saturday night. He was well known as a carver in local church work.

St. Stephen's Church, Exeter, has recently been repaired externally and reseated. Both works were carried out by Mr. E. Mudge of that city.

Lord Rosebery will visit Scarborough and open the new Liberal Club at the latter part of this month or the beginning of October. The club is in the principal thoroughfare, and has been erected at a cost of £11,000.

At a special meeting of the Council of the Sheffield Society of Architects and Surveyors, the president, Mr. Charles Hadfield, in the chair, it was unanimously resolved to convey to Mrs. Pye-Smith and her family an expression of their respectful sympathy in the loss which they have sustained by the death of the late town clerk of Sheffield, Mr. J. W. Pye-Smith.

The partnership hitherto subsisting between A. Nutter and C. Riley, architects, land and building surveyors, estate agents, valuers, and fire loss assessors, Burnley, under the style of Riley and Nutter, has been dissolved.

Engineering Notes.

QUEENSFERRY.—The bridge over the Dee at Queensferry, 6½ miles below Chester, now being constructed at the joint cost of the Cheshire and Flintshire county councils and the Dee Conservancy Board, is approaching completion, and will be opened early next year. Mr. T. W. Barber, of St. Leonard's-on-Sea, is the engineer-in-chief, and Mr. T. K. Irwin the resident engineer. The unique feature of the bridge is that the centre is made up of a telescopic draw span, which will be worked by hydraulic power. The abutments on both sides of the river are already completed. Resting on these abutments, and on clusters of piles, will be two fixed spans—one on each side of the river—and out of these fixed spans will run telescopically two girders which meet in the centre and so complete the bridge. The telescopic girders, when withdrawn for the passage of vessels, will leave a clear opening in the centre of the channel of 120ft., the total width of the river between the abutments being about 400ft. The carriage way on the Flintshire and Cheshire sides to the edge of the centre span—that is to say, for a distance of some 140ft. from each abutment—will permit of two vehicles passing one another, but over the centre or movable span, only one vehicle can pass, the width of the roadway being here only 9ft. Two 3ft. 6in. footpaths, however, will run over the whole length of the structure, centre span included. The cluster of ten piles on the Flintshire side of the river is already in position, and the workmen are now screwing the piles on the opposite side. Messrs. J. Schofield, Sons, and Co., of Leeds, are the contractors for the abutments and approaches, and the contractors for the ironwork are the Teeside Iron Company, of Middlesbrough. The total cost will exceed £13,000.

THE SNOWDON RAILWAY.—The railway from Llanberis to the summit of Snowdon, 3,050ft. in height, is making good progress. The engineer, Sir Douglas Fox, will read a paper on the undertaking before the British Association at Ipswich next week. The undertaking is the only example in Great Britain of the rack principle, the system adopted being the Abt or double rack-work. At Llanberis, the lower terminus will be in the grounds of the Victoria Hotel, a short distance from the local station of the London and North-Western Railway, and on the summit of the mountain itself a Grand Hotel will be erected. The length of the line is under five miles, and it has been laid out with a view to obviate interference with the Ceunart Mawr waterfall. There will be two intermediate stations, and the trains will consist of a steam locomotive and two cars of the tramway type, capable of seating 50 persons each. The gauge of the railroad is a narrow one of 2ft. 7in., and the metals, made by Cammells, of Sheffield, run 41lb. to the yard. They are laid on steel sleepers. The rack-rails between the ordinary rails are made with double cast-steel cogs, into which the locomotive engages by two double pinions, so that four teeth are always in gear at the same time. No curves are sharper than five chains, or 264ft., radius, and no gradient steeper than one in 5½. The engines, which are made by the Rinecker-Abt Company, are fitted with Chatelier brakes, actuated by passing air into the locomotive cylinders, the piston working against the residue of air under pressure. The steel sleepers have been supplied by the Ebbw-Vale Works. The passenger coaches will be constructed by the Lancaster Carriage and Waggon Company. The contractors for the railway and the hotel are Messrs. Holme and King, of Liverpool. The date for opening the line to the public has not up to the present been definitely fixed.

◆

The urban district council of Brigg have received 15 competitive schemes for the drainage of the town. The number has been reduced to four, the authors of which have each had an interview with the members of the council.

At the meeting of the Christchurch rural district council, last week, it transpired that no plans had been submitted for the new board school buildings either at Bransgore or Ripley, and the clerk explained that the plans had been approved by the Education Department in each case. The members considered that the council had a right to see the plans to know whether they were in accordance with their by-laws, even supposing the Education Department had passed them, and a formal resolution, requesting the plans of both schools to be deposited, was carried.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are [illegible] up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., [illegible], LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

PARTY-WALL. (The length of 9in. wall marked A A in your plan comes within the definition of "party-wall"; but the 4½in. walls on ground plan appear to be clearly external walls. As to the second question, we do not understand for what purpose the 9in. party-wall is to be built, as the first-floor plan shows a dovetailed arrangement of the bedrooms. The sectional sketch is not clear if it applies to the plans sent. As to the construction, we do not think a party-wall carried on two 7in by 3in. joists would be passed by the local authorities. No by-law in the Model By-laws contemplates the erection of a party-wall on wooden joists, and from a constructional point of view, we should certainly say it is undesirable, if not bad.)

RECEIVED.—E. F. Sedgley.—B. R. S.—M. U. Co.—Jas. Turner.—T. R. (Leicester).—E. G. and Co.—F. R.

Correspondence.

WAR DEPARTMENT SURVEYORS.

To the Editor of the BUILDING NEWS.

SIR,—The prospects of surveyors in this department are extremely problematical in the face of the forthcoming reforms which have of late been so much discussed. What these are to be various conjectures have been formed, but it is very certain that should the Inspector-General of Fortifications have direct communication with the Secretary of State for War, and in any way override the future Commander-in-Chief as to the proper organisation of his corps, the outlook for surveyors will be very gloomy, as he is one of the old school, with little war service and bred up under the existing system, which leads outsiders to look upon his officers as genuine architects and civil engineers, and not the nonentities which surveyors find them to be.

It is evident that any radical change cannot come from the chief author of the existing system, as any alteration entails a loss to those in power. It is, however, consoling to think that we are to have a strong man in the coming Commander-in-Chief, who will look to the efficiency of the army, untrammelled by prejudice, and desirous of having the corps capable of taking the field against Continental armies. It is to be hoped he will have sufficient power to lop off those nonentities we meet in this department, who have fossilised themselves with correspondence, and are confessedly incapable of commanding troops on *active* service. The existing system has nothing to recommend it, as it makes neither soldiers nor architects, and turns officers into loafers against their will. The younger men feel this, but, as they rise, become callous and absolutely indifferent to the shame of knowing much less than their military foremen of works.

"Traveller" and "Verb. Sap." have pointed out what the existing conditions are—as they were. Should reform touch the department and rid it of these "deadheads," and properly recognise surveyors, the prospects will be good; but if the Inspector-General of Fortifications gets the upper hand—and he is waiting for the cast of the die—then let professional gentlemen avoid the Department.—I am, &c., REFORM.

◆

CHIPS.

At Hornsey, on Monday, Mr. Stanley Edward Spencer, the well-known balloonist, of Holloway, was married to Miss Rose Isabel Hawkins, who is described in the daily papers as "auctioneer, surveyor, &c."

The city council of Manchester at their last meeting accepted the gift of a replica of the well-known tapestry, "The Adoration of the Magi," designed by Sir E. Burne-Jones, and worked by Mr. William Morris. The original cartoon is hung in the Municipal Art Gallery at Birmingham, and only three copies in tapestry are in existence—one at Exeter College, Oxford, a second in the possession of Mr. Wilfred Blunt, and the third that just presented to the City Art Gallery of Manchester.

With the close of the Parliamentary session, the Royal Assent was given to the Bill confirming the Provisional Order extending the boundaries of the borough of Keighley. The newly-included areas comprise the populous lower portion of the Hainworth Ward, annexed from the new parish of Bingley Outer, and an extensive area formerly under the government of the Oakworth district council, notably the ancient village of Utley. The population of the borough is thus increased from about 32,000 to 36,000.

The Christchurch rural district council discussed at their last meeting the necessity for providing a fever hospital. It appeared that Mr. Burton, a local architect, had prepared two or three alternative plans for the institution during the past ten years, and it was proposed that he should be appointed architect. To this an amendment was moved that plans be invited in competition; but the consideration of both amendment and resolution was postponed, the medical health officer to be asked in the mean time to give advice as to the number of beds that would be required in each section of the hospital.

The new line between Wrexham and Ellesmere will probably be opened for both passenger and goods traffic on October 1st. Colonel Yorke, R.E., the Board of Trade inspector, will make his official inspection on Wednesday and Thursday in next week, the 18th and 19th inst.

The tower of Bonvilston Church (on the road between Cardiff and Cowbridge), which is in such a dangerous condition, has at last been taken in hand, and the work of restoration has commenced. The fine peal of bells will also be rehung. The work of restoration, &c., has been intrusted to Mr. Charles B. Fowler, F.R.I.B.A., of Cardiff, the contractor being Mr. W. James, of Cowbridge.

Herr David Vanderkellen, Director of the State Museum at Amsterdam, and a distinguished painter and author, died on Monday, aged sixty-eight years.

The Lords of the Committee of Council on Education have selected Mr. Gilbert R. Redgrave, Chief Inspector of Schools and Classes under the Department of Science and Art, as a Delegate to the Third International Congress on Technical Instruction which is about to be held at Bordeaux, in connection with the International Exhibition now being held there.

At a meeting of the Streets Committee of the Corporation of Middlesbrough, held on the 30th ult., Mr. B. J. Wolfenden, A.M.I.C.E., of the borough surveyor's office, Southport, was appointed assistant engineer. The final selection lay between Mr. J. Rush Dixon, of Walsall, and Mr. Wolfenden.

The day schools adjoining the Convent of the Cross in Parkwood-road, Pokesdown, near Bournemouth, are being enlarged, the enlargement being so extensive as to almost double the size of the schools. The work is being carried out by Mr. W. Hoare, of Victoria Works, Bournemouth, who built the former schools, and who was also the contractor intrusted with the erection of the convent buildings.

Intercommunication.

QUESTIONS.

[11417.]—**Models.**—Would any of your readers kindly oblige with some information concerning the making of architectural models? Are there any handbooks on the subject, or has it ever been dealt with in our pages?—J. G. O.

[11418.]—**Cool Roof.**—What means can I adopt to keep a slate roof cool? Is there any non-conducting material which could be utilised for the purpose? If so, how shall I apply it?—W. J. J.

[11419.]—**Sketching in Derbyshire.**—Is permission required, and if so from whom obtainable, for sketching at the following places?—Longstone Hall, Tissington Hall, Elleston Manor House, Wooton Hall, halls at Somersall, Herbert, and Sudbury, Bowsall Manor House, Hardwick Hall, and Bolsover Castle.—Nomad.

[11420.]—**Mortgagee and Surveyor's Charges.**—No arrangement having been made, on what scale is a surveyor entitled to charge?—1. On house property considered sufficiently secured? 2. On similar property not recommended? I believe a license is not required in these cases; but if the charges come under the head of "Valuation of Property," as in the Institute Schedule, is a license then necessary?—An Inquirer.

[11421.]—**Girder Calculators.**—Are there any mechanical means by graphic processes for calculating the strength of girders, and thereby save calculation or working out formulæ?—Sigma.

[11422.]—**Sussex.**—I am about taking a walking tour in this county, and shall be glad if any correspondent can give me the names of places and buildings within a reasonable distance of Eastbourne, either possessing interest of a natural or archæological kind.—G.

[11423.]—**Ventilating Pipes.**—As many sanitary experts are divided in their opinion as to the advantages of the soil-pipe ventilator, and also the inlets which are now put on every modern system of house-drainage, I should like the opinions of any practical readers who have tested these inlets and outlets. I am in doubt, myself, whether they always act as they are intended to do. Some assert that they are more pernicious to health than otherwise.—Open Mind.

REPLIES.

[11403.]—**Estate Management.**—In reply to the inquiry of "Z. Y. X." in your Intercommunication column, there is a book published by Messrs. Crosby, Lockwood and Co., in their Weale's Series, entitled "Building Estates," which should give all the information he requires.—W. Denton.

[11412.]—**Varnished Wood Ceiling.**—"G. B. D." had better paint his ceiling of a light colour, this would be the least expensive process of bringing back the reflecting power of the ceiling.—G. H. G.

[11413.]—**Geometrical Projection Drawings.**—Any treatise on projection would teach the principles. Why not join a school of art, where drawings of this kind are taught?—A. Z.

[11416.]—**Civil Engineering.**—To attempt to give a list of even a few of the best works on such a subject as this would be of little use to "W. H. H." He cannot do wrong, however, to get such works as Rankine's "Manual of Civil Engineering"; Henry Law's "Rudiments" in Lockwood's series, as elementary works; and for the various special branches he may get Humber's treatises on "Water Supply of Cities and Towns," and the four volumes of Humber's "Progress of Engineering," published by Lockwood, and the works on Hydraulic Engineering, published, I think, by Longmans. There are so many branches that it is misleading to a beginner unless knowing what branch he intends to follow (which probably he does not himself) to attempt to recommend books.—G. H. G.

◆

By the opening, on Monday, of the Sault Ste. Marie Canal, Canada's independent route from Lake Superior to the Atlantic seaboard has been completed. The construction of the canal cost £700,000 sterling.

The Lostwithiel and Fowey railway, built over 30 years ago on the broad-gauge system for mineral traffic, has just been converted to the narrow gauge, and reconstructed for passenger traffic for the Great Western Railway Company. The contractor was Mr. R. M. Parkinson. The line is five miles in length, and follows the bank of the River Fowey.

It has been decided to repair the Market Cross at Chichester, and the council have adopted the scheme recommended by Mr. Detmar J. Blow, architect, and approved by the Society for the Protection of Ancient Buildings. There will be as little alteration as possible in the present appearance of the structure, but the cross will be put into substantial repair. We illustrated the cross from a pen-and-ink drawing by Mr. Albert G. Thompson in our issue of April 8, 1892, and on Jan. 4, 1889, we gave a reproduction of a water-colour by Mr. T. M. Baynes, showing a suggested restoration of the structure.

The town council of Plymouth having applied to the Local Government Board for sanction to borrow £17,610 for purposes of street improvement and sewerage, £2,833 for the improvement of the Hoe and for providing bathing accommodation, and £1,600 for the erection of a mortuary, Colonel J. O. Hasted, R.E., held an inquiry into the application at the Plymouth Guildhall on Wednesday last.

Legal.

COMPENSATION AWARDS.

As a general rule, either party can take up an arbitrator's award on paying his fees, and then, if successful, he would be able to recover those fees as part of the costs of arbitration and award if that were given in his favour. But it seems that this sound and general rule does not apply to arbitrations under the Lands Clauses Consolidation Act, 1845. In the recent case of "The Earl of Shrewsbury v. the Wirrall Railway Committee" (*Times*, July 31), the plaintiff had claimed £21,700 for some land, and the railway offered £9,500. After arbitration, the company did not take up the award, so the plaintiff did so himself, and paid the umpire 400 guineas before he got it. The award gave the land-owner £11,860, and so he became entitled to his costs of the arbitration under the statute. Naturally, the plaintiff put down this 400 guineas as part of those costs; but the taxing-master disallowed the whole of the item, on the ground that it was no portion of the costs of the arbitration, it being the duty of the company, and not of the land-owner, to take up the award, under section 35 of the statute—a duty enforcible by mandamus.

The unfortunate land-owner then brought this action to recover the 400 guineas as money paid by him for which the company were responsible, as they were legally bound to take up the award, and to pay him, as the successful party, the whole costs of the arbitration. But Mr. Justice Romer decided that the payment so made had been voluntary, and was, therefore, irrecoverable; while if it could be considered as costs of the arbitration, it had been disallowed by the taxing master, whose decision was final and conclusive. Now the Court of Appeal here felt bound, rather regretfully, to support this ruling. The land-owner, instead of paying the umpire his fee to get the award, should have obtained a writ of mandamus against the railway company to compel them to take it up as directed by the statute, and he would then have been paid his costs of so doing. But as matters stand, owing to his having acted in the simple and straightforward way he did, instead of pursuing this roundabout method, he loses his 400 guineas and all the costs incurred in trying to get it back again, which serves to show that the law is still somewhat technical and uncertain.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

CHIPS.

In the case of Norman de Maid, of Clacton-on-Sea, builder, the discharge from bankruptcy has been suspended until a dividend of not less than 10s. in the pound has been paid to the creditors.

At Monday's meeting of the Middlesbrough Town Council, the electric lighting committee reported that, in accordance with the instructions of the council, they had selected Mr. R. Hammond to advise them as to the lowest cost of an economic working electric lighting plant.

At Monday's meeting of the Harrogate Corporation, a letter was read from Messrs. Martin and Fenwick, stating that it was intended to lay out what was called Paley's Estate, about 165 acres in extent, and sell it in sites for villas and terraces; and asking what the corporation would do towards the sewering, &c., of the estate. The letter was referred to the highways and sanitary sub-committee.

A Conservative Club is about to be built in Habershon-street, Splotlands, Cardiff, from plans by Messrs. Habershon and Fawckner, of Pearl-street, Cardiff.

The south porch of Great Burstead parish church, Essex, is in course of restoration.

All Saints' Church, Shrewsbury, which was built in 1875, Messrs. Bowdler and Darlington, of St. Julian's-friars, in that town, having been the contractors, is about to be renovated, and all the roofs retiled. The work is to be done in sections; the first portion, to be commenced in a few days, is the organ-chamber. The contract has been let to Messrs. Treasure and Sons, builders, under the superintendence of Mr. Lloyd Oswell, architect, all of Shrewsbury. The other portions to be done are the chancel, two side chapels, transept, vestries, and nave. The work will entail an expense of about £500.

LEGAL INTELLIGENCE.

Arbitrator's Award on Insanitary Property in Liverpool.—At Monday's meeting of the Insanitary Property and Artisans' Dwellings Committee of the Liverpool Corporation, the receipt was reported from the Local Government Board of the awards of Mr. J. Lawson Walton, Q.C., M.P., in respect of the compensation to be paid by the corporation to owners of insanitary properties. The award comprises 17 properties, of which ten were settled in court, leaving seven for the arbitrator's decision. The statement giving the amount claimed for the properties, the final offer, and the amount awarded in each case shows that the amounts awarded are in most cases only slightly in excess of the final offers of the corporation, and much below the amount claimed by the owners of the properties. In comparing the amounts awarded with the final offers, it has been decided by the Court of Appeal that the valuation of the properties must not necessarily be based on the value of the land and old materials only (which was the principle adopted by the late arbitrator, Mr. Hunter Rodwell, Q.C.), but that the rent-producing power of the property must be taken into consideration by the arbitrator in assessing the compensation. Under these circumstances, therefore, the results of the arbitration were satisfactory to the Liverpool Corporation and to the officials who have had the conduct of the cases. Mr. H. Percy Boulnois (city engineer) also reported that of the 572 houses in the 12th presentment 14 were demolished by the owners without asking for compensation; and 52 houses were agreed to be demolished on the payment by the corporation of sums amounting altogether to £437, or an average of £8 8s. per house. In those cases the owners retain the sites of the houses. The remaining 506 houses have been purchased by the corporation for sums amounting to £17,460, or an average of £34 10s. per house. Included in these purchases were four shops fronting Limekiln-lane, and let at rents of 6s. per week each. For those a considerable higher price than the average had to be paid, and if they are excluded, the average price paid for the remaining houses is £33 10s. per house. The sites purchased measure approximately 13 649 square yards, which have cost £1 5s. 7d. per yard. Against this there will be the balance obtained by the sales of old materials (less the cost of making good adjoining property); but these amounts cannot yet be ascertained, as all the property has not yet been pulled down.

Serious Charge against a Builder.—A Llandaff police-court, on Monday, Frederick Millward, builder, of Whitchurch, was indicted on remand under four charges—(1) of stealing a large number of builders' tools, to the value of £5 7s. 8d., between April 3 and 24 last, the property of Edwin Williams, Whitchurch; (2) of breaking into the lock-up house of Edwin Williams, Whitchurch, and stealing therefrom 41 pots of paint, three bundles of axle pulleys, four bundles of sash-cording, ten bundles of cockspur sash fasteners, and twelve bundles of hinges, value £2 8s. 4d., between April 11 and 17; (3) also charged by Evan Davies, Whitchurch, with stealing thirteen cupboard fronts, value £2, on October 27, 1894; and (4) with attempting to commit suicide by cutting his throat with a razor on May 16 last. On May 16, Mr. Williams observed prisoner leaving his dwelling-house to visit the premises where he was engaged in building operations. Prosecutor followed him, and discovered on his premises a large number of tools which he had missed. He thereupon gave information to the police, but before the police could arrest the prisoner he attempted to cut his throat. Edwin Williams, one of the prosecutors, said that upon being taxed with the theft, prisoner had offered him £20, and asked if that would "do for him." The majority of the stolen tools were found on the premises which prisoner was erecting, but four planes were found in the bedroom of his private house. Mr. Evan Davies, builder, deposed to finding thirteen cupboard fronts of his, which he had missed, in the back bedroom of prisoner's house. The Bench committed prisoner to the quarter sessions, and allowed bail.

◆

The preparations for the revival of the Olympic Games at Athens are now being actively pursued. The reconstruction of the Stadion is being carried out. The ground has been levelled over the foundations of ancient buildings. The cost of this work will be about £12,000 sterling, and will be defrayed by M. Averof, of Alexandria. The buildings will be of marble. The work on the Stadion is to be completed within five months from the present time.

Grove-street Chapel, Coventry, which, since 1838, has served as the headquarters of Primitive Methodism in that city, was reopened on Sunday as an Undenominational Christian Church. The building has been renovated inside and out, additions being made to the vestry accommodation, new seating provided, and a baptistery formed for the immersion of adult believers. Mr. T. Gaskin, of Gosford-street, Coventry, was the contractor.

STAINED GLASS.

BACUP.—A large stained-glass window has just been placed in the south transept of Bacup Church by Mrs. Howorth, in memory of her husband, the late Mr. John Howorth, of Hempsteads, Bacup. The window, which consists of three long openings, has been filled with glass designed to illustrate the Te Deum. The prominent figure in the central opening is the Lord Jesus Christ crowned, enthroned upon a rainbow, His right hand raised in the act of benediction, in His left the orb and sceptre, and having the earth for His footstool. "The Lord sitteth above the water-flood, and the Lord remaineth a King for ever." "The Heaven is my throne, and the earth is my footstool." A golden glory surrounds the entire figure, and beyond this are groups of adoring angels, some bearing ribbons with the words, "To thee all angels cry aloud," and "Thou art the King of Glory, O Christ." Below the enthroned Christ, and on either side, are shown the Apostles, the Martyrs, the Prophets, and the heads of the Church Universal, to illustrate the text, "The glorious company of the Apostles praise Thee," &c. The figures in these groups are in the act of adoration, and each figure is further distinguished by some appropriate emblem or attribute. The work is from the studio of Messrs. Powell Brothers, of Park-square, Leeds, whose design was selected in competition with other artists, and the whole has been under the supervision of Messrs. Mawson and Hudson, architects, Bradford.

CHIPS.

Three stained-glass windows, executed by Messrs. Swaine, Bourne, and Sons, Birmingham and London, have been placed in Northam Mission Church for the deaf and dumb, Southampton. The subjects are Our Lord healing the man deaf and dumb with the words "Ephphatha—be opened," the Virgin, and St. John.

Some years ago the Obelisk in the Central Park in New York was affected with a disintegrating process of scaling in a manner similar to that which creates anxiety for the preservation of Cleopatra's Needle on the Embankment. A preparation of paraffin was poured over it, with the result, as recently reported, of arresting decay.

The well-known drinking fountain, presented to the City of London by the United Kingdom Temperance and General Providence Institution for Mutual Assurance, opposite to whose offices at the north-eastern side of London-bridge it stood, has been removed to Clapham-common.

Rastrick Church, Yorkshire, has been reopened after some extensive internal decoration on walls and roof, upon the latter of which has been painted the days of Creation. The work has been done by Messrs. Powell Brothers, of Park-square, Leeds.

The Holborn Board of Guardians have adopted plans by Mr. Evans Vaughan for a new model laundry and epileptic wards to be erected at the Mitcham Workhouse.

The Duke of Devonshire will open the Midland Dairy Institute, at Kingston Fields, near Loughborough, on Tuesday, the 17th inst. The Institute has been formed for the counties of Notts, Leicester, Derby, and the Lindsay Division of Lincolnshire.

The Technical Institute in Waterloo-road, Runcorn, recently opened by Sir John T. Brunner, Bart., M.P., is a brick-built structure. The architect was Mr. John Bowden, C E., of Manchester, and the builders were Messrs. Hulse, of Winsford. The total cost has been about £4,300.

Alderman William Collinge has accepted an invitation to occupy the mayoral chair at Burnley from November next. Mr. Collinge is a partner in the firm of Messrs. W. and J. S. Collinge, Limited, upholsterers and cabinet-makers, Burnley.

The blessing and opening of the Roman Catholic Church of Our Lady of Refuge at Cromer took place on Sunday, August 25th, by the Very Rev. Canon Duckett, D.D. The new church is of red brick faced with stone, as also are the mullions of the windows. The architect is Mr. George Sherrin, and the builder, Mr. Chapman, of Hanworth. It is situated on the Overstrand-road, within easy distance of Cromer Station, on the slope of the hill upon which Cromer Lighthouse stands, close by the Golf Links and the new Links Hotel.

The urban district council of Leyton is erecting what promises to be the finest technical institution in Essex, costing between £7,000 and £8,000, of which the county council of Essex has promised £1,500. This building, with the town-hall connected with it, will cost £23,000 at least.

The members of the York Architectural Society have made a visit of inspection to the new sewerage works of the York Corporation at Fulford and Naburn, proceeding from the Guildhall by steamer. The city engineer, Mr. A. Creer, explained the scheme. At the hall at Naburn the party partook of tea.

WATER SUPPLY AND SANITARY MATTERS.

CHESTER-LE-STREET.—At a meeting of this council, held on Thursday, it was unanimously agreed to adopt the recommendation of the sewerage committees for two comprehensive and complete schemes of main sewerage and sewage disposal to be constructed forthwith in order to meet the requirements of the Local Government Board and Durham County Council, per plans and estimates prepared by Mr. D. Balfour, M.Inst.C.E, F.G S., of Newcastle-on-Tyne. The first scheme embraces the whole of the villages within the townships of Pelton, Ouston, and Urpeth; also the village of Chester Moor, remaining part of the town of Chester-le-Street, with an aggregate population of 19,500, and comprises 20½ miles of main sewers of 24in., 21in., 18in., 15in., 12in., and 9in. fireclay pipes and appurtenances at a cost of £15,030, and for sewage disposal works by chemical precipitation and filtration, in conjunction with intermittent land filtration on a small acreage as officially required, at a cost of £5,500, to be altogether repaid by a 30 years' loan, and involving an average assessment of 3d. per £ on a rateable value of £19,398. The second scheme embraces the whole of the villages within the townships of Washington and Usworth; also village of Pattinsontown in Barmston township, and Eighton Banks in Lamesley township, as well as houses in a small portion of the town of Gateshead, having the watershed to the river Wear, with an aggregate population of 12,500, and comprises 18¾ miles of fireclay-pipe main sewers varying from 21in. to 9in. diameter, and appurtenances, at a cost of £13,000. This amount includes ample outfall, subsiding tanks for simply clarifying the sewage before it reaches the tidal portion of the river Wear below Washington Staiths, having there considerable ebb and flow, and which the Rivers Pollution Act exempts from the expense otherwise indispensable of complete sewage disposal works. The entire cost will be repaid by a 30 years' loan, involving an average assessment of about 5½d. per £ for constructional works on a total rateable value of £32,058.

WINTON, HANTS.—The Christchurch Rural District Council are considering a proposal to give a water supply to Winton, a populous parish near Bournemouth, part of which is already supplied with water from the water company's mains. At last week's council meeting the inspector reported that he had made inquiries as to the number of houses in Winton parish which needed a better water supply. In North Winton and Moordown there were 142 houses supplied from wells, 175 from tanks, and 13 from public wells, whilst 16 had no water supply at all. The greater part of the wells were not, he added, protected from surface drainage and contamination, and in many cases the water in them was quite unfit for drinking purposes. The clerk said the cost of laying mains would be about £1,000, and the water company were not prepared to lay out that sum without a guarantee. After some further discussion, the matter was deferred to a future meeting.

* * *

At a meeting of the Coventry town council in committee, it has been resolved, by a majority of 18 to 6, to deal with the sewage question according to the Baginton or Sherbourne Valley scheme. The council have thus reversed their decision of a few weeks since to persevere with the Avon Valley scheme, for which they had previously failed to obtain sanction from the Local Government Board, and which is strenuously opposed by Lord Leigh. Mr. James Mansergh, C.E., of Westminster, has been instructed to prepare detailed plans for carrying out the adopted scheme.

The old plain east window in the parish church of Hythe, near Southampton, has been replaced by a stained-glass one. The centre light contains the Annunciation, the Madonna, and, above, the Crucified Saviour. The right and left lights show figures of the Magi and the Virgin, and the Shepherds and St. John the Divine respectively. In the two outer lights are the Salutation of Mary by Elizabeth, and the Baptism of Jesus on opposite sides, and above these figures of St. Elizabeth and St. John Baptist on either side. The artists were Messrs. Burlison and Grylls, of London.

The Watching and Lighting Committee of Aberdeen have resolved to introduce a system of overhead electric lights, suspended in the middle of the streets.

The management sub-committee of the Birmingham Municipal School of Art held a special meeting on Friday to award the "blue ribbon" of the school—namely, the scholarship founded in memory of the late John Skirrow Wright, and awarded once in six years for exceptional merit. The scholarship is of the monetary value of £180, and also includes free admission to all the classes at the Central School. The award is made on three classes of examinations. The examiners reported that the competition was keen and satisfactory, and on their recommendation the scholarship was awarded to Miss Mary J. Newill.

Our Office Table.

LADY WESTON, of Clifton, Bristol, has presented to the National Gallery a picture by William J. Müller, representing a "Street in Cairo," from the collection of her late husband, Sir Joseph D. Weston, M.P. The painting is an excellent specimen of the Oriental work of Müller, 1812—45, of whose landscapes the National Gallery now possesses three examples. It has been numbered 1463, and was hung on Monday at the north-west corner of Room XX. In the foreground are several gaily-dressed Arabs, Turks, and negroes, one man in a white burnous, who brandishes a long spear, being conspicuous. Behind are dilapidated two-storied houses, showing the mixture of pseudo-Classic pilasters and mesribeyehs characteristic of Cairo, and to the left, at the corner of the square, an old man squats on the board of his bazaar, waiting, pipe in mouth, for customers for his brazen jars. Behind, to the right, a square tower and a white dome of church and mosque cut into the cloud-flecked blue sky. The painting, which is signed, measures 23in. high by 35in. wide, and is hung on the line.

THE collapse of the landing-stage attached to the pleasure pier at Morecambe, on Monday, by which three lives were sacrificed and many persons received serious injury and severe shock, will call attention to the necessity for insisting that even the smallest subsidiary adjunct of an iron structure upon which great and sudden strains may come should be constructed with a liberal margin of safety above the theoretical limits of tension. Furthermore, such structures should be inspected at regular intervals—certainly at the beginning of every summer season. It has been stated by the secretary to the Morecambe Pier Company that the structure, which was erected so long ago as 1868-9, has been periodically examined by experienced men. In the present case the failure seems to have arisen through the snapping of a cast-iron girder which supported the iron grating 15ft. square forming the landing-stage proper, upon which the temporary gangway from the steamboat rested.

AT the concluding meeting, on Wednesday, of the Roman Catholic conference that has been held at Bristol, Dr. Gasquet read a paper on the "Metropolitan Cathedral," now in course of erection from Mr. J. F. Bentley's plans. Cardinal Vaughan afterwards stated that the new building at Westminster would have a larger nave than any other cathedral in the country, York not excepted. The structure would be 380ft. long and 156ft. wide, and would only be exceeded in dimensions by seven or eight of the old English cathedrals. They would thus obtain that which they most desired—namely, accommodation for a large number of persons in front of the high altar. They could not attempt to rival in costliness the buildings of old. They had to be satisfied with doing a little at a time. At present they were erecting the shell of the main building, and the great advantage the architect had seen in the Early Byzantine Christian style of architecture was that they could put up the entire shell at very little cost in the way of ornament. If they put up a Gothic building, the ornament must be put up at the same time. They hoped within two or three years, if Providence favoured them and the country took up the subject, to erect the entire shell of the structure.

IN his report to Sir Isaac Holden on the heating and ventilation of the Houses of Parliament, prepared by Mr. James Keith in March last year, the engineer summarises his indictment of the present system of ventilation as follows:—(1) That there is insufficient change of air in summer; (2) that the air admitted in winter is devitalised by being passed over scorching steam-pipes; (3) that the extraction of the vitiated air in the House of Commons is so arranged that only members on the front benches get any material benefit; (4) that sewer-gas finds its way into the committee rooms and into both chambers; (5) that in warm weather the ventilation is not only most ineffective, but there is a tendency to have down draughts of vitiated air impregnated with sewer-gas; (6) that the fresh air being admitted into both Houses and to the division lobbies through gratings on the floor, it is impregnated with dust, &c.; (7) that the atmosphere of the corridors and committee rooms, &c., is subject to contamination, owing to the weak and variable system of extraction; and (8) that the atmospheric conditions are much worse in the House of Commons than in the House of Lords.

During the course of excavations for the foundations of the Passmore Edwards Convalescent Home at Limpsfield Chart, in connection with Charing Cross Hospital, the architect, Mr. J. J. Thompson, of Chelsea, believed that good workable stone existed near by. The digging was continued near the site, and at a depth of about 40ft. from the surface the excavators struck stone. It proved to be a good, rich, endurable material of a greyish-green colour, and the hospital is being entirely built of it. The remains of an ancient stone quarry have also been brought to light, and experts who have seen it have no hesitation in adding it to the list of recently-discovered Roman remains. Many examples of pottery have been found—all of Roman origin—in the same place, and the discovery of these, and of the stone quarry has caused great interest. Not a little of the credit of the finds is due to the clerk of the works, Mr. Vinnell. The last discovery in the same place is a spring, the water of which has been analysed by the analyst to the Charing Cross Hospital, who reports that it is simply perfect. The water is obtained automatically by means of a ram.

The syllabus has just been issued of the Architectural curriculum at King's College, London. Under the efficient management of Professor Banister Fletcher, F.R.I.B.A., M.S.A., assisted by his son, Mr. B. Flight Fletcher, A.R.I.B.A., and by Messrs. James Bartlett and W. H. Webb, day and evening classes are held at the college, the course including: Architecture considered as a fine art, as construction, and in modern practice; constructional and geometrical drawing, quantities, engineering surveying and levelling, the geology and chemistry of building materials, and other subjects. There is an excellent museum of architectural photographs and building and sanitary materials, and a useful and well-stocked architectural reference and lending library at the college.

A movement is on foot, inaugurated by the Yorkshire Archæological Society, to raise funds with which to excavate the ruins of the Carthusian Monastery at Mount Grace, near Nothallerton. It is proposed to clear out and drain two of the best preserved of the old houses at the Priory around the great cloisters, to level the turf down to the surrounding gardens, to remove the accumulation of soil in front of the church, and show its connection with other buildings, and to open up the chapter house and the passage used by the frater priors, the relative positions of which are unknown. The owner, Mr. William Brown, of Arncliffe Hall, who is a member of the council of the Yorkshire Archæological Society, and local secretary to the Society of Antiquaries, has afforded every facility for the proposed new works, and has also promised pecuniary aid, while Mr. W. H. St. John Hope has expressed his willingness to assist the society in superintending the excavation.

The first meeting of the executive of the recently-formed Scottish Building Trades Federation was held on Friday afternoon in the rooms of the Building Trades' Exchange, Glasgow, Mr. David Heron, builder, Edinburgh, president, in the chair. Members were present from all parts of the country. Mr. James L. Selkirk, C.A., was elected secretary and treasurer. Arrangements were made for securing the affiliation of all trade associations throughout the country connected with the various branches of the building trade, and also for forming local associations where these did not at present exist. The annual meeting of the Federation was fixed to take place in Glasgow on Wednesday, October 23.

A coroner's inquest has been held at New York into the causes of the fall of the Ireland Building in that city, by which 16 men lost their lives. As in another recent case, the jury was composed mostly of architects and builders. The structure, a warehouse, was originally intended to be seven stories high, but was made a story higher after the lower portion was built; the foundations and walls, which had been approved by the City Building Department, were not increased in strength when the decision was made to put on an additional story; and the concrete foundations, which, if laid according to the specification would have been of sufficient thickness, were, without the consent or knowledge of the architect, made much thinner than the specification required. Furthermore, the contractor for the plastering had carelessly allowed a great weight of material to accumulate in the upper stories, and the flat roof was overloaded with gravel. The inevitable failure revealed itself in the foundations, and a dwarf column in the basement, which rested partly on a filled-in well, snapped, bringing down the entire warehouse. The testimony of the architect showed that he was paid only 600dol., say £120, for his work on the building, including general supervision; that two superintendents were employed, after the foundation-work was begun, by the owner, and paid by him; that, although he visited the work about twice a week, he did not particularly inspect the trenches before the concrete was put into them; and that the change in thickness of the footings was made without his knowledge or consent. The jury found the architect, the contractor, and three other persons guilty of manslaughter, a verdict which, if the evidence is correctly reported, is unduly rough on the architect.

At the last meeting of the Manchester City Council, Sir John Harwood called attention to the hardship sometimes imposed upon owners of property which had been condemned by a corporation as insanitary. Where the property was held on a short lease, the owner, in the event of his deciding to improve rather than to demolish, could have no time in which to recoup himself for the expense of the alteration. He suggested, therefore, that the Municipal Corporations Association should be asked to co-operate with the Manchester City Council in securing a Bill to compel landlords in such cases either to buy out the existing owner's interest, or to extend the lease to such a period as would give the owner a reasonable opportunity of recoupment. The chairman of the sanitary committee undertook to bring the matter forward on a future occasion.

◆

On Saturday a large and representative gathering of Borderers and others assembled at the site of Henlawshiel, on the Cavers estate, a few miles from Hawick, to unveil a granite obelisk, marking the spot whereon [illegible] stood the cottage inhabited by the parents of Dr. John Leyden (1775-1811), poet and Oriental scholar, and in which he spent his boyhood days. The committee also unveiled a tablet inserted in the birthplace of the poet in the village of Denholm. Both memorials have been executed by Mr. Robert Robinson, of Hawick.

Another of the Chapter-house windows at Lincoln Minster has been filled with stained glass, illustrating further the history of the cathedral, and is the eleventh of the series. The three compartments represent—(1) King Henry V. hearing in the Chapter-house the suit between the then Dean, John Mackworth, and the canons of the cathedral; (2) Bishop Fleming founding Lincoln College, Oxford; (3) Henry VI. holding his Court in the Episcopal Palace at Lincoln.

An inquest was held at Aston, on Friday, as to the death of Joseph Onions, labourer. A solicitor watched the proceedings on behalf of W. E. Aston, builder and contractor, of Lichfield-road, by whom deceased was employed at the time of his death. On Thursday in last week Onions was excavating a drain-sewer, and had got to a depth of 5ft. 6in., when the soil gave way, and he was buried. The ground was not shored up; but Mr. Aston had suggested to deceased that this should be done, and Onions said that he would not be able to work if the boarding was put in. Thereupon Mr. Aston ordered that the hole should be widened, so as to permit the shoring being done. The jury returned a verdict of "Accidental death," and added a rider to the effect that there had been negligence on the part of Mr. Aston in not having had the soil shored up.

The parish church of St. Mary, at Bagillt, was reopened on Tuesday, after having undergone extensive renovations and alterations. The principal improvement is the total renewal of the old and inconvenient pews, and the substitution of pitch-pine sittings of a modern and comfortable character. The principal entrance has also been removed to a more convenient part of the building. The work has been carried out by Mr. Richard Jones, builder, Bagillt, from plans prepared by Mr. Bibby, architect, Flint.

A project for bridging the Wye at Brockweir, near Tintern, is making progress. On Monday the chairman of the Highways and Bridges Committees of the Gloucester County Council, accompanied by Mr. Robert Phillips, county council surveyor, visited Brockweir, where they met the local committee in conference; the outcome of which was that it is proposed that local subscriptions to the extent of £1,000 be raised, and that the county councils of Monmouth and Gloucester contribute about £2,000 each, the estimated cost of an iron structure being about £5,000.

Trade News.

WAGES MOVEMENTS.

Inverness.—The Inverness plasterers went out on strike on Monday. They demand an increase on the standard wage from 7d. per hour to 8d., owing to the great amount of work that is going on in the district.

CHIPS.

The district council of Dawley have appointed Mr. J. J. Bailey as their surveyor.

The partnership heretofore subsisting between J. T. McLachlan and W. H McLachlan, builders, decorators, and house and estate agents, Duke-street, Adelphi, W.C., and The Pavement, Clapham, S.W., has been dissolved.

A stained-glass window of plain grissaile colours has been erected in Salisbury Cathedral by Lady Hulse, mother of Mr. E. H. Hulse, M.P., to the memory of her mother, the widow of Dean Hamilton. The window, which was executed by Mr. A. O. Hemming, of London, occupies the northern end of the north transept.

The Sunday-school premises at the rear of Trinity Baptist chapel, Haslingden, are about to be enlarged and reconstructed, and a lecture-hall and ten additional classrooms will be provided. Mr. H. Fielding, of Haslingden, is the architect.

The new station of the London and South-Western Railway at Bodmin is nearly completed, and the line will be opened for traffic on Tuesday, Oct. 1. Carriages will then run right through to London without change.

The works committee of the Edinburgh and District Water Trust met on Monday and opened the tenders for contract No. 1 of the Talla water scheme. There were in all eighteen tenders, varying from about £50,000 to £70,000, and five of the lowest were remitted to the water engineer to examine and report upon.

A scheme for lighting the central part of Swansea by electricity, and using in combination with the apparatus a dust-destructor, was formally sanctioned on Monday by the electric lighting committee of the Swansea corporation. The [illegible] scheme, which will be on the high-tension system, will cost about £56,000.

The members of the Yorkshire Archæological Society, about sixty in number, met on Friday at Nunnington, and having inspected the parish church, proceeded to Stonegrave Church, containing a Laudian screen, and in the churchyard a 10th-century cross. Oswald Kirk and Gilling Castle were afterwards visited.

Memorial-stones of new Wesleyan day and Sunday-schools at Horbury Junction were laid on Saturday. The building will accommodate 250 scholars, and the cost is to be about £1,000. Messrs. Thornton and Son, of Dewsbury and Wakefield, are the architects.

The Lord Provost's Committee of the Edinburgh Town Council have decided to take the advice of Mr. W. Wybrow Robertson, A.R.I.B.A., of H.M. Board of Works, Edinburgh, upon the plans prepared by Mr. T. Morham, the superintendent of works, for the enlargement of the City Chambers.

After a long discussion, the town council of Cardiff adopted on Monday a resolution appointing a special committee to consider and report as to the desirability or otherwise of carrying into execution the provisions of Part 3 of the Housing of the Working Classes Act, 1890, with respect to lodging-houses for the working classes.

The monthly report of the Amalgamated Society of Carpenters' and Joiners' states that strikes are still in progress at Swansea, Croydon, and Dundalk; but that in Darwen, Middleton, and Perth substantial advantages have been secured without any stoppage of work.

At the last meeting of the city council of Leeds, it was resolved to apply to the Local Government Board for sanction to borrow £100,000 for waterworks purposes. This money will be required, not to discharge liabilities, for there are none, but to meet the requirements of the city in relation to the water supply. The extensions needed comprise a new 30in. main from Swinsty to Eccup, the new pumping engines at Headingley for the high-level supply, and new service reservoirs at Harehills and Beeston for low-level supplies.

It has been decided by Mr. Farquharson, of Invercauld, to restore and render habitable Old Mar Castle, Braemar, the building in which the Jacobite rising of 1715 was hatched. "The Standard on the Braes of Mar" was raised at a point about half a mile further up the river, a spot now included in the site of the Invercauld Hotel. The work of restoration has been intrusted to Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2124.

FRIDAY, SEPTEMBER 20, 1895.

PUTTING SCIENCE FOR ART.

EVERY man of ordinary education thinks himself in no danger of confusing these two things. Yet it is common enough, even in writings of some literary pretensions, to find the one mistaken for the other. It is a blunder that seldom fails to show itself in the daily papers when the British Association week comes round; and this year it has appeared in some unusually fine specimens. We have had a high-class journal congratulating Sir Douglas Galton, not on the account which he actually gave of the discoveries of science since 1831, but on an account which that journal supposes him to have given of what it calls the "works" of science in bridges, railways, and the like. A British Association address must naturally be uncongenial reading to a political leader-writer; but if he shrinks from perusing it, he should decline to write about it. Yet, after all, he does not flounder more helplessly than the reporter and the telegraphist, who sent, as the latest news from Ipswich, a statement that "*helium* has been discovered in Bach gas." The person who was responsible for this singular announcement possibly supposed the possession of this rare element to be the secret of Bach's musical genius. It is well for other composers that he was mistaken, or chemists would have been contriving means by this time to subject some of them to destructive distillation.

These little drolleries, however, may be pardoned as a welcome relief, amidst the daily round of murders, suicides, and yacht-races. The mental obtuseness which takes science for art, and art for science, is a more serious thing. It arises, perhaps, in part, from the vulgar notion that art means making pictures, and nothing else. Art, on the contrary, as distinguished from science, means making anything, provided it is made in a human way, with thought and invention. Immense mischief has been done by drawing a sharp line between the so-called "Fine Arts," and the so-called "Useful Arts." There ought to be no such sharp line. Some arts, it is true do more for men's bodies, and others do more for their minds; and so far, the former are lower than the latter. But in ages when men cultivated all their faculties, instead of allowing half of them, as they now do, to perish by disuse, even the lowest art had something of grace and beauty in it. The very plumbing of olden times is better worth looking at than the jewelry of to-day. A bit of 15th-century carpentry, roughly shaped, and not even planed, has a charm which whole shopsful of cabinet-making and French-polish cannot rival. The village blacksmith, when he hammered out a key-plate or a casement-stay, showed momentary flashes of the same sort of power which created churches and cathedrals. It was not only in the Middle Ages that this happened. In Greece and Rome, too, at their best, all arts were fine arts. But a century or two ago a race of critics and connoisseurs arose, who misunderstood Classic work as much as they despised Gothic. They knew a little of Roman architecture and sculpture, and they had read something about Roman painting. Beyond this their minds were a blank. In their dense ignorance, therefore, they proclaimed architecture, sculpture, and painting to be the only material arts deserving the name of "fine." They practically told the mason and the carpenter, the plumber and the smith, that their thoughts and inventions were not wanted. It was for them, and the like of them, to occupy themselves with nothing but mechanical drudgery. Their business was with the "useful" arts, and for the useful arts ugliness was the proper thing. If it should happen by chance that some rich man was so given over to luxury that he wanted even these men's productions beautified, an architect or a draughtsman would "beautify" them by sticking them over with ornaments! The critics and the connoisseurs preached to a believing audience, and what they taught is the popular creed to this day.

Somehow or other this creed has got itself mixed up with the name of science, and when thoughtless people see a piece of construction that is very large and very ugly, it comes into their heads that science has made it. But science makes nothing. The business of science is not to make, but to find out how things are already made. In our time it has found out, amongst other interesting and important matters, a great deal about the nature of iron and its compounds. It has told us what is the strength per square inch of section of practically pure iron; of iron with this proportion and that proportion of carbon in it; it has ascertained what are the properties of iron combined with silicon, or with phosphorus, or with nickel, and an affinity of things of the same class. To everybody who finds in iron the material he requires for his special purposes this information is invaluable. He can calculate by means of it what sizes of iron are the very least which each part of his work must have, though science certainly does not forbid him to put larger ones, as from the way in which "scientific construction" is sometimes spoken of one might be led to suppose. But science, on the contrary, having taught him all it knows about the nature and properties of the stuff he is using, leaves him perfectly free to use it in whatever way may commend itself to his judgment. Now we see what the nature of the man is. If he is a man with all his faculties—a man like an ancient Greek, for instance, or a Mediæval builder, he will make a shapely work out of his iron, and a work more, and not less, strong and durable for being shapely. But if, as unhappily occurs much oftener, he is a man with his perceptions blunted and half his mental powers perished for want of exercise, he will make a work which is hideous to the core, and will then, perhaps, try to beautify it by plastering on vulgar finery. If he does this, let him take the blame to himself, and not lay it on science. Science gave him no advice on the subject either one way or the other.

Iron construction, especially, has become confused, in the popular notion, with science, because iron construction presents such easy and simple cases for science to inquire into. The engineer knows that his iron or his steel will bear so much per inch in the way of tension, and so much in the way of compression, and that each rivet has a certain average strength. He calculates his strains, and proportions his materials accordingly, after making some moderate allowance for chance defects. But this cannot be done with anything like the same accuracy in masonry or brickwork construction. In these, it is true, science can tell what and whereabouts would be the thrust of an arch of a certain shape and thickness, supposing there were no friction between the voussoirs. But frictionless voussoirs are not in the market, and nobody would buy them if they were. The strength of most arches depends greatly—sometimes wholly—on the friction between the arch-stones or arch-bricks, and on the cohesion of the mortar or cement they are set in. This varies with time, growing greater for years as the mortar or cement hardens, and then lessening again as time at last decays it. Moreover, at the same moment it varies in different parts of the structure. Here, the labourer made his mortar up well; there, not so well. At this point the cement was finely ground; there, in spite of all precautions, it was a little coarser; and there, again, the fixer "knocked it up" after it had begun to set. In this place the sand was sharp and good; in that one, a spadeful of dirt had got amongst it; and so on, from beginning to end of the structure. Who can calculate the exact influence of these things? Who ever will be able to calculate them? Yet it is such things as these which make it impossible for the architect, who is mainly a builder in brick and stone, to get as much good out of science as the engineer can, who is mainly a builder in iron and steel. The architect's figures are only an approximation: he has to make a liberal allowance, in addition, for sources of weakness, which cannot be precisely foreseen. The typical engineer, on the contrary, while he sticks to iron and steel, can very closely foresee the real strength of his structures. The result is that he revels in calculations. His conscience chides him for walking across a room without knowing the scantling of the joists; and if his engineering studies had begun in time, he would have declined to run alone till he was satisfied that the transverse section of his legs was large enough to support the weight of his body.

We can none of us have too much science. But we can easily make a wrong use of what we have, even if it is but a little. The worst use is to try and make it serve instead of art. Science itself never pretends to take up such a position. It simply answers our questions as to strength of materials, direction of strains, and the like. The artist makes a design for a structure, and science, on being applied to, will tell him—pretty accurately if it is in metal, and more vaguely if it is in brick or stone—what its ultimate strength will be. It shows him what are its weak points, and how far it is safe or unsafe. But, in addition to safety, there are a multitude of important things to be regarded in every design, and about most of these science says nothing at all. It does not follow from this that the designer should think nothing at all of them. Yet this is the tendency of the man who tries to put science in the place of art. Where science stops, he stops. By a delusion of his own mind, he takes it for granted that he ought everywhere to use the smallest quantity of material which, while the structure is fairly new, will be safe. By another delusion, he thinks it his duty so to proportion strains and resistances, that every part of his structure, if over-loaded sufficiently, would collapse, at least in theory, at the same moment. He is pleased to call the working out of these two delusions "scientific construction." The effect of them, in filling our cities, and even our country places, with hideous monstrosities, is seldom out of our sight. The delusions will have their day. But, in the mean time, it is not science which is to blame for them. Science invents nothing and designs nothing, either ugly or beautiful. Science merely ascertains facts, and leaves the inventor and the designer to turn them to account. When the inventor has very little power of invention, and the designer is ignorant of the first principles of design, they turn the facts of science to bad account instead of good, and then, if people tell them so, pretend it was science which forced them to do it.

MISUSE OF DETAIL.

CERTAIN amenities in building are just as much expected by every sane man or woman as those observances which touch dress or manners. And yet we very seldom find them studied by those whose business it is to erect buildings along our public town thoroughfares. Look, for example, at the many obstructions which impede our passage along the footway, the obtrusive porch and steps, the shop window, the cellar opening, not to speak of the exasperating shop lamp or awning. Some of these details are thought, perhaps, beneath the attention of the architect; but it is just because they are so that they become themselves obnoxious, and remind us somewhat ironically that we cannot justifiably disregard them. In a true sense, indeed, an architect ought to be omniscient or ubiquitous, and should not consider anything, however small it may appear, to be too trivial to be attended to. It is one distinguishing mark of the architect's work, that every minute detail receives attention, just as it is of the cheap jerry builder that all are invariably scamped. Who, for example, has not observed in the cheap buildings of the day the want of finish in matters like grates, door furniture, festoonings, and the *et-ceteras* of the trades generally? Even the way the base of a stone pillar is designed, or a window-sill or doorstep is finished, is clumsy and awkward. And just in the same spirit of unheeding detail do we find many things that are thoughtlessly designed, which are a continual source of vexation and nuisance. Such things as an awkward and inconvenient entrance, a crooked passage or staircase, an obstructing shop-front, are aggravating to everyone who has to use them, and they always reflect very painfully on the architect. We can cite numerous instances. Mr. A., who goes to the new municipal offices, invariably sustains a ricked ankle in stumbling down a few steps in a dark corridor, or he stumbles up two or three unsuspected steps in a vestibule or lobby. Or, owing to an awkward and badly set out angle winders on the staircase, Mr. B. sustains an injury. Both A. and B. blame the architect for the bad arrangement, and as they are both accidents of painful remembrance, they leave a far more lasting impression on the mind than any of the good or artistic points in the design of the building. What A. and B. have experienced, hundreds of other people must experience every year. Again, how many people who frequent public halls and churches libel the architect if they catch a cold in the head or suffer from neuralgia, owing to the position of the windows or the means provided for opening the casements? These details have more concern for congregations than all the architectural skill evinced in the design. Bad ventilation or poor acoustical properties are equally reprobated at the architect's expense. A hundred other things may be mentioned which concern the reputation of the architect more intimately than any of his cherished convictions as to proportion or artistic design. After all, these details appeal more directly and powerfully to the mind, which looks for some correspondence between what is reasonable and right and what is artistic. If we deny any relationship between them, we have no right to say that architecture is the art of embodying fitness in the most agreeable or beautiful manner.

One sort of mistakes refers to projections. How much a projecting porch or bay window should obtrude, and in what place, are points which do not often occur to the architect's mind. He introduces them on his plan without in the least thinking of the thousands of people who will pass them or come in collision with them during every day in a busy street, and he only studies the elevation of his building. And it is the same with details like cornices and columns. But, surely, the public ought to be considered in such matters. Of course, the local authorities of most towns frame by-laws which regulate these matters. "Rules as to projections" are provided in the London Building Act, but in spite of them we observe very awkward arrangements. If we cast our eye over the provisions of the new Act now in force, we find certain rules. Thus, it is enacted that in a street of a width of not more than 30ft., a shop-front may project beyond the external wall to an extent not exceeding 5in.—why not 6in. we have never been able to discover. In a street of greater width than 30ft., a shop-front may project 10in., but not more. These regulations are useful and necessary in street buildings, if they can be observed; but they seem almost ridiculous when in one shop-front we find a very clumsy and awkward window-sill which projects several inches beyond the limits so assigned. Another thing we cannot understand is why the cornice of a shop-front is limited in projection to 13in. and 8in. respectively, while other lower projections can be made without stint. Again, in one sub-clause to section 73, rules are given as to the height of woodwork of shops, which is not to be fixed higher than 25ft. above the pavement, and as to the fixing of woodwork nearer than 4in. to the centre of party-wall, &c.; but we do not find a word about projecting sills, or pilasters of wood in other positions. The rules given have been made chiefly as a safeguard to prevent the spreading of fire—a very desirable precaution; but as to other inconveniences of projecting woodwork, nothing is said. There are also a number of rules given relating to bay-windows—that they must not project more than 3ft. from the main wall, or be nearer to the party-wall than their projection, &c., and as to oriels and turrets, it is laid down that they may project only so much (12in.) over the public way, and no part be less than 10ft. above level of footway, &c. Here we have definite rules as to projection; but there is not a word said about other projections, like steps, or buttresses, or piers, which may be so clumsily placed as to become positively dangerous to foot passengers. It is not merely that all projections are more or less awkward and dangerous to the public, but their position may make them more so. The last clause of this section seems to exempt many kinds of projection, for it refers to copings, stringcourses, cornices, fascias, window dressings, and other architectural decorations, which are plainly excepted from the operation of the Act. We certainly should be the last to lay down any Procrustean rule as to projections to buildings, especially those of architectural character, except those which are awkward and dangerous. Because they are obtrusive and uncouth we should say they have lost their character of being architectural. In one place or position a projecting pier or cornice or stringcourse may be architectural, in another position—where it becomes awkward—it cannot be. The position and circumstances ought in every case to determine the fitness and beauty of an architectural feature. As a practical example we should unhesitatingly condemn a cornice which projected over the footway at the height of one's head or shoulder, and which threatened everybody with a knock on the head or shoulders every time he passed it unwittingly. And yet such instances occur, even in central London. On the east side of Arundel-street the brick piers of a house have stone cornices or cappings which are extremely awkward to the pedestrian, and there are many similar examplifications of the architectural misuse of detail, where they may be positively wrong because misplaced and awkward. All projections in the wrong position are absurd or positively dangerous, and if statute does not touch them it is the duty of the architect to see that his own code of ethical principles rigidly excludes them.

TRICKY DRAWINGS.

EXAGGERATION is a vice not confined to writers of fiction and dramatic authors. Artists and draughtsmen are adepts in the art of misrepresenting or magnifying qualities which appeal to the senses or human passions, and the tricky draughtsman knows what an effect a few touches, a dash or a dot, or even a shadow, may produce in the mind of the undiscerning public or committee. One noticeable instance of trickiness has been mentioned by Mr. T. G. Jackson, A.R.A., one of the examiners of architectural design of the National Competition Drawings which we lately noticed. In his report on the designs, he refers to the treatment of elevations or geometrical drawings by many of the students, who are fond of tricking up geometrical elevations into pictures, and he points out very truly that the habit is not only "useless, but mischievous, encouraging students to think in elevation rather than in perspective, and the public to believe that an elevation gives a true idea of a design." We have before now advocated the value of an architectural designer thinking in perspective, or in the solid, more than he is in the habit of doing. Under no circumstances can a geometrical elevation give a fair view of a building, as it is needless to inform anyone acquainted with the subject; yet it is the one and only representation of a building which the popular mind can understand. A plan which is also a geometrical projection is a reasonable mode of representing the horizontal section of a building, but it does not lend itself so easily to misrepresenting the facts; and the same is to be said of a vertical section. Each represents precisely and exactly the real proportions of each room, its length, width, and height, and every line in a plan or a section defines the solid parts or walls which are cut through. Not so the elevation. The lines in many cases represent only the front faces of solids, the vertical projection or traces of features, which have a depth or meaning which cannot be expressed. But the elevation appeals to the public eye, while the plan and section do not, and for this reason architects and draughtsmen have devoted a great deal of time and artistic labour in making them as pictorial as possible. One way of doing this is to introduce shadows; to put in shadows of every projection, every pier or column and cornice, to shade up the reveals of the windows, often regardless of any rule of true shading. The effect is, of course, as every draughtsman knows, quite magical. The dull, lifeless look of the geometrical drawing is enlivened, and the flat tints or washes brightened up by the process. The details and projecting features, so to say, leap into light, just as the modern "Dot and Dash" style of illustration has a tricky look and sparkle about it, which seem to captivate our Transatlantic brethren.

We remember when the pernicious habit of "back-lining" drawings was very common. It was done for a similar reason—to brighten the drawing; and, after all, we doubt whether the practice is not less open to objection than shading, which gives a fictitious appearance to the elevation. Mr. Jackson observes, on this subject, "The art of elaborately shading geometrical drawings has no practical value. No architect ever makes such drawings in his practice, and there is no demand for assistants who can do them." Observe, this remark was made more particularly in reference to those shaded drawings of buildings which the art schools encourage their students to execute in competition. Happily there are not many architects who indulge now in shaded elevations, though the practice was very common at one time, as may be seen in many of the tinted or shaded elevations left by the late John Soane, the Smirkes, and other architects of a past generation. The French and German schools have long followed the same plan, and many of their elevations of buildings are remarkable examples of scientific shading and execution. As a useful exercise in projecting the shadows of features on sciographic principles there is nothing to say against the practice: the objection is in making the art a mode of pictorial representation, and of devoting so much of the young student's time to it. Our chief objection is to substituting it for a more rational way of indicating relief or solidity, as that of perspective projection, shading, or colouring geometrical drawings. A cast shadow of a tower, or a porch, upon an elevation cannot be of much value artistically, as it does not correctly represent to the eye the real effect, to do which the shadow must be represented in perspective. We do not find fault with this kind of drawing as an exercise in projection, but only when it is used to trick up or misrepresent the object.

The introduction of trees and figures in the foreground of elevation drawings is inexcusable. The practice of shading or "flashing" in the windows in elevations is also carried too far by some draughtsmen. Flat dark washes or broken tints as a conventional mode of showing window openings are reasonable: but we have seen the reflection of glass represented in a manner repugnant to all sense of propriety. We must remember an elevation is simply a geometrical drawing, representing the real proportions to scale of the features on one plane; it is merely a conventional mode of defining the dimensions of a building—a technical drawing, and any attempt to impart to it qualities of a pictorial kind is altogether out of place.

An exaggeration of another kind—a deception which is sometimes practised in competition drawings—is to tack on to an elevation a return side in rapid perspective, with an object of making an easy perspective view. No doubt there is a temptation to do this to save time, if the return elevation has any important feature in it. It is so easily done, and a pictorial completeness (save the mark!) is at once given to the drawing. Imagine a corner tower "cooked" to show the return, or an octagonal cupola—we have seen such a distortion; and a worse one, the geometrical elevation made to appear in perspective by showing the returns, or one side of the window reveals and arches! To such improprieties does the cunning craftsman commit himself!

But the art of illusion by means of lines and colour does not stop at elevations. Perspectives are often most cunningly manipulated by architectural draughtsmen in a manner that is quite a reproach to the profession. What, for instance, is more deceptive than dragging into view a part of a building which could not by any possibility be seen from the point of view selected? We have often remarked the upper part of a tower or a cupola put in where it could not by any chance be seen, or a portion of a front "forced," which, correctly, would be lost to view by a projecting wing or part of the building. These exaggerations are thought to be legitimate by many artists, because it is the only means open to the architect to represent his building as it really would appear if we could take it in all round, or as it would appear if he sent a good model of it. They say, with some reason, that a correctly drawn perspective, like a photograph, may give, after all, a very false impression, or misrepresent or exaggerate portions or features which, in actual fact, would not appear. Very true; but this is the fault of the draughtsman in selecting his point of sight or the "horizontal line." Within certain limits every perspective draughtsman who is an artist can take little licenses without being chargeable with trickery; he can, for instance, extend or diminish his "points of distance," place his "picture plane" a little nearer or further from the station point by what is practically the same thing—viz., making certain adjustments or alterations in the drawing itself, after the main perspective lines have been run. He can heighten this or that feature, lessen this or that projection, and adjust and balance a number of little points which only the artist can do without seriously misrepresenting the general effect. Like an honest craftsman, the architect knows how to give and take without exaggeration of a kind which encourages spurious draughtsmanship. Competitions are chargeable with encouraging architectural jugglery, for the simple reason that the competitor is tempted to flatter the public eye and the vanity and self-conceit of the Englishman. The "man in the street" says: "I know nothing about art, but I know what I like"—a phrase which has prompted the draughtsman to cater for a class of people who are not very critical. In short, it is the old dodge of catering down to the people's taste. The designer, too, falls into the trap, whether he is designing art furniture or buildings. Vulgar and superfluous ornament and colour are to be found in the piano or the coal-vase seen in the furniture dealer's window; so also the design with plenty of domes and turrets is more captivating than the plain, honest-looking building. One of the usual tricks amongst draughtsmen is to exaggerate the scale of the building by an artful extension of the real visual rays, by manipulating the "picture plane," by introducing a landscape or a number of figures, which very seldom obey the laws of perspective. These magnified, and often distorted, views "take" the popular eye. If there is a tower at one corner, it is made prodigious: the vanishing lines are rapid and drawn at an acute angle; every window recess or cornice is drawn with an exaggerated fulness, the lines and shadows are coarse or strongly put in. Exaggerated importance is given to a portico: every column and coffer of its beamed roof is drawn with telling effect. When we refer to the plan and elevations, we are disillusioned at once: they are comparatively small and meagre. But the draughtsman is not the only sinner in the art of misrepresentation, the colourist is equally guilty. In addition to obvious tricks of the brush, he is addicted to various kinds of exaggeration. One of the commonest is that of casting intense shadows. These are not always real, but imaginary cloud shadows over the front of the building, obscuring a part of the design which is poor or unsightly, as sweeping right across a façade with the object of producing an illusive effectiveness, of strengthening the profile of a dome or a piece of skyline. But when intended as real cast shadows, how often are they true? And in this indictment we by no means leave out the artist in "black and white" or line perspectives. From the absolutely feeble and purposeless way some of these drawings are shaded, it is only generous to assume that they are quite ignorant of the simplest rules of shading. Imagine the cast shadow of a tower standing in front of a building going right off at an angle across the façade, parallel to the object which casts the shadow; or the by no means uncommon mistake of assuming the solar luminary to be in different and opposite points of the heavens. These blunders are common enough in competition and other drawings. When shadows are introduced for artistic reasons, they can at least be put in not to offend against common laws of nature, as some painters have done when they introduce a rainbow with the colours in inverse order. A dark, thick shadow is not in keeping with an architectural drawing: it is put in rather with the object of unduly accentuating a feature or projection, and for this reason it is misleading. Heavy and opaque tints are also to be avoided in drawings of this kind, and it ought to be one of the rules of architectural colouring that the tints or washes should be thin. Another mischievous practice is the use of bright colours, and of methods of execution which are more suitable for pictures. In a few of the recent competitions, the perspective drawings were tinted more in the manner of so-called "artistic advertisements" in bright reds, greys, browns, and yellows, than sober views of buildings—quite subversive of those principles of architectural colouring which have been recognised as true. No wonder these extreme modes of tinting have caused committees and their advisers to look with suspicion and distrust on the colouring of any kind of competition drawings.

◆

THE BRITISH ASSOCIATION AT IPSWICH.

In continuation from last week's report of the Congress of the British Association which has been held at Ipswich, we give, as in former years, abstracts of a few of the papers of special interest to our readers. Full reports of the proceedings are given in the last and current issues of the *English Mechanic and World of Science.*

POSSIBILITIES OF COAL IN SUFFOLK.

In opening the Geological Section, the President, Mr. W. Whitaker, delivered an address upon "Underground in Suffolk and its Borders." He pointed out how much the knowledge of the geology of the county had been advanced by engineers and others by means of the 476 wells, of which an account with some geologic information had been published. He summarised the information thus obtained in reference to the drift, crag, Eocene, tertiaries, and cretaceous beds; and coming then to the most interesting problem in the geology of the Eastern Counties, "What rocks underlie the cretaceous beds at great depths?" said beyond the out-crop of the lower beds of the cretaceous series in Cambridgeshire and Norfolk we found a powerful development of the great Jurassic series; but the only two recorded deep borings in and near Suffolk that had pierced through the cretaceous base, at Culford on the north-west and Harwich on the south-east, showed not a trace of anything Jurassic, passing suddenly from the Cretaceous into far older rocks. The recent trial boring at Stutton showed precisely the same thing, the gault resting directly on a much older rock. The proof of the occurrence of Silurian, Devonian, and carboniferous rocks next beneath cretaceous or Jurassic beds having been, to some extent, established by trial borings in the London basin, the first place suggesting itself to geologists for trial borings was the neighbourhood of Dover, and the trial had been made successfully, several hundred feet of coal measures having been found with several workable beds of coal. Reasoning from this discovery, and from the results of many other borings, Mr. Whitaker could not see why they should expect anything but a like occurrence of coal measures in detached basins in our vast underground tract of old rocks. What was the evident conclusion from what we knew and what we might reasonably infer? Surely that trials should be made to see if such hidden coal basins could be found. There were objectors in this as in other matters. He remembered the time when certain geologists disbelieved in the possibility of the occurrence of coal measures anywhere in South-Eastern England, it being argued that the formation thinned out before it could get so far eastward. The first boring made specially to test the question (at Dover) disproved both the above negative theories by finding coal measures with workable coal. Let them hope that a like result might happen in East Anglia, and the pessimists again be in the wrong. They must not, however, expect an immediate success like that at Dover. They were here much further from any known coal-field.

BORING FOR COAL AT STUTTON.

Mr. J. Vivian, C.E., managing director of the Vivian Boring and Exploration Company, described, in a paper read before the Engineering Section, the details of the machinery employed in the Stutton boring. His machine consisted of a drill armed at the point with black diamonds equal in hardness, though not in toughness, to the white brilliant. They had now bored 1,350ft., starting with a bore 11in. in diameter, and now having one 5¼in., tubes being inserted from time to time as they went down through bad ground. They pierced through the chalk at 825ft., thence it was gault till a depth of 895ft. was reached, and after that sandstone and shale. Mr. Vivian said there was no definite depth specified that they were to go, but his company had guaranteed to go 700 yards, there being thus close upon 800ft. more to go. His firm had, of course, nothing to do with the strata, except to produce samples.

Mr. Whitaker also described the trial boring at Stutton. This, the first attempt of the Eastern Counties Coal Boring Association, was in the low ground southward of Crepping Hall, and had been successful in reaching the base of the cretaceous beds at the depth of 994ft., and in proving that these were underlain by a much older rock. The tertiary and cretaceous beds passed through were as follows:—Drift (river gravel), 16ft., London clay and Reading beds, 54ft.; upper and middle chalk, 720ft.; lower chalk, with very glauconitic marl at the base (almost a greensand), 154ft.; gault, $49\frac{1}{2}$ft.; and palæozoic rock, with a high dip. The thickness of both chalk and gault was slightly less than at Harwich, and there was also a little less of the tertiary beds.

COAST EROSION.

The committee appointed at the jubilee meeting at York, in 1881, presented its fourth and final report on the erosion of the sea coasts of England and Wales, and the influence of the artificial abstraction of shingle or other material on that action. The seagirt counties were 29 in number, and all of them, except Cornwall, Devon, Northumberland, and Cumberland, were being eaten into by the sea. In some cases the inroads were very serious, owing to the soft nature of the rocks. The committee reported:—"The preservation of the coast and the conservation of our seagirt counties is a matter of urgent necessity. It affects many varied interests—governmental, county councils, Crown rights, and private ownership. Under these circumstances, the committee do not offer any suggestions as to the department which should take charge of the work, or as to the incidence of taxation to provide for the same, but are of opinion that a working result could be most quickly obtained by a departmental committee of the House of Commons."

Two papers dealing with the inroads which are being made by the sea near Southwold were read, that by Mr. Horace B. Woodman dealing chiefly with the sections of strata freshly exposed, while Mr. John Spiller dealt with the losses of cliff at Southwold, Covehithe, and Easton Bavents during the past twelve months.

LIGHT RAILWAYS.

Major-General Webber, C.B., gave an address on "Light Railways as an Assistance to Agriculture," in which he submitted a scheme showing eleven or twelve light road lines radiating from Ipswich, averaging about seven miles each in length, designed to be constructed at the side of the public roads in the country, and in the roadways where they pass through the streets. The capital expenditure he put at £124,000, and he estimated that these lines would pay 3 per cent. on the capital outlay. There would be no difficulty in working these 77 miles by means of electricity if overhead conductors were permitted, and the refusal to allow them was ludicrous in view of what is carried out in towns like Lubeck, Gera, Breslau, Christiania, and many other towns abroad. All could be worked from one central electrical generating station, but they could not be made to pay with the sparse traffic and low rates prevalent in the district. As to gauge, he noted that at Tiptree, in Essex, a light railway is projected, and that a gauge of 4ft. $8\frac{3}{4}$in. is proposed, but he advanced strong arguments in favour of a much narrower gauge.

THE GROWTH OF HARWICH AND ROTTERDAM.

A paper on "The Growth of Harwich" was read by Mr. William Birt, general manager of the Great Eastern Railway, who showed that the town possessed no railway communication till 1854, and that the growth of the port dated from 1863, when the G.E.R. commenced to run boats to Rotterdam. It was now the fifth in importance of English ports. The Dutch authorities are now constructing a short railway round Rotterdam, which will shorten the distance *viâ* Harwich to Berlin, Northern Germany generally, and Russia by 25 miles.

The President of the Section (Mr. L. F. Vernon Harcourt) read a paper on the new outlet of the River Maas at the Hook of Holland, and the improvement of the Scheur branch up to Rotterdam. He said:—The gradual shoaling of the mouths of the Maas, coupled with the increasing draught given to sea-going vessels, rendered the access to Rotterdam inadequate in the first half of this century. In 1858 Mr. Caland proposed cutting a new direct outlet for the Scheur branch of the Maas across the Hook of Holland, continued across the foreshore into deep water by fascine-work jetties, and this scheme was approved and commenced in 1863. The north jetty was carried out in 1863-74 to a length of 2,187 yards, and the south jetty in 1864-76 for 2,515 yards; the channel across the Hook was excavated, 164ft. wide and 10ft. deep, in 1868-71; and the old outlet to the south of the Hook was closed by a dam in 1872. The new channel was first used by fishing vessels in 1871 and by steamers in 1872. The river was also regulated by training works, in a gradually widening channel, from Rotterdam to the Hook. The scour, which had been relied upon for widening the cut and deepening the channel across the foreshore between the jetties, proved inadequate to accomplish this. Accordingly in 1882 the widening of the narrow cut by excavation and the deepening of the jetty channel by dredging, and its narrowing 656ft. by a low training bend to the south, were commenced. The river above has also been further regulated and deepened by training and dredging. By these works the river has been made to widen out uniformly from 330 yards at Rotterdam to 765 yards at the ends of the jetties. The minimum depth at low tide between the jetties and in front has gradually been increased from 10ft. in 1882 up to $26\frac{1}{4}$ft. in 1893, and the rise of tide adds about $5\frac{1}{2}$ft. The maximum draught of the vessels navigating the new channel has increased from $19\frac{1}{3}$ft. in 1882 up to 25ft. in 1893. Vessels can now reach Rotterdam from the sea in two hours. The improvement of the river has transformed Rotterdam into a large port; large basins surrounded by quays have been formed opening into the river, in addition to quays along the river; and considerable extension works are in progress for providing further accommodation for vessels and the rapidly growing trade of the port.

REMOVABLE WEIRS FOR PREVENTING FLOODS.

A paper was contributed by Mr. R. C. Rapier and Mr. F. G. Stoney on the practicability of controlling the discharge of flood waters by means of removable weirs more efficiently than by fixed weirs. From the drainage aspect, the fixed weir was only a blundering, stupid obstruction; and the first use of a river was the drainage of the country. The rainfall reaches the rivers more rapidly now than formerly, and, therefore, the rivers ought to be widened, deepened, or straightened; but for navigation there must be capacity without velocity. The fixed weir must be low enough to allow the flood waters to get off somehow, and during ordinary river flow has to put up with less head of water and less power than nature supplies. Thus the fixed weir provides only an inefficient compromise; and it was obvious that the maximum range of requirements may be fulfilled by means of a removable barrier. Removable weirs—a sluice-gate on free rollers—could be applied to any river for navigation, irrigation, or power. They could be operated under all conditions of head and flowing water. The great sluice erected 12 years ago at Beleek to control the waters of the Loch Erne lakes are a fair example of maintaining a full summer water-level for navigation and mill power, while giving absolute command of great periodical floods. The Manchester Ship Canal affords a useful example of the application of these sluices to canalised rivers. There are others across the Rhone near Geneva, at Richmond on the Thames, and for the river Clyde at Glasgow. In the discussion that followed, Mr. Chatterton, C.E., held that the tidal channel below Teddington was altogether insufficient to take off the tremendous volume of water coming down in time of flood, while the removal of fixed weirs would take away the head of water too. The utility of removable weirs was attested by Major-General Webber, Mr. Deacon, Professor Unwin, Alderman Sir B. T. Leech, of Manchester, and Sir F. Bramwell; and Dr. Anderson, Mr. Head, and others spoke. The president recognised the value of removable weirs; but said, while they might mitigate floods, they could not prevent them. Mr. Stoney, in his reply, admitted that the sluices would not prevent floods; broadly speaking, a river must be capable of discharging its maximum flood. He concurred in recognising the necessity for water-shed authorities to prevent the isolated action of local authorities.

It was arranged to hold the next meeting of the Association at Liverpool, to be opened on September 16, and that for 1897 at Toronto.

AUSTRALIAN RENAISSANCE ARCHITECTURE.—II.

(By Our Special Sydney Correspondent.)

[WITH PHOTO-TINT ILLUSTRATIONS.]

SINCE I despatched, under the title of "The American Romanesque in Australia," an account of the new office building of the Equitable Life Assurance Society of the United States, another gigantic edifice, also erected in Sydney by another great American Insurance Company, has grown towards completion. In this instance, however, America has had little to do with the structure, beyond the very important matter of providing the "sinews of war." The style of architecture adopted is that which has hitherto been employed for nearly all the great secular buildings in Australasia—namely, the Renaissance. With the exception of the iron and steel castings, and certain patented and other articles, which had necessarily to be imported (and which came almost entirely from England), the fine materials and splendid workmanship are Australian; and the architect, Mr. John Kirkpatrick; the contractors, Messrs. Phippard Brothers; and the clerk of works, Mr. James S. Hawkes, are all natives of these colonies and established in Sydney.

The new Sydney office building of the Mutual Life Insurance Company of New York stands at the north-western intersection of Martin-place and Pitt-street, directly opposite the great General Post-Office, and on one of the finest sites in the whole city, having a frontage of 100ft. in the former thoroughfare and 73ft. in the latter, while the height from the pavement to the top of the parapet is 114ft., and the depth to the sub-basement floor 14ft. 9in. There are in all nine stories, and the building is solidly constructed of stone as regards the principal façades, with back, side, and internal walls of brick. The stone employed for the basement (which is only half-sunk below the street level) and the ground floor is the adamantine grey-drab Bowral trachyte, whilst that for the six upper stories is the fine Waverley sandstone quarried within a few miles of the spot—a stone possessing a creamy straw-colour when freshly hewn, which soon assumes a warm, deep ochreous hue, and finally passes into a light, reddish-brown. Contrary to the practice not unfrequently adopted here, even in important buildings, of simply facing with ashlar the so-called solid stone walls, both the trachyte and the freestone are in this instance used absolutely solid throughout, so that the walls possess a massiveness rarely equalled even in the best Australian structures. The foundations are carried down to the solid rock, 29ft. below the street level, and stand upon a bed of concrete 8ft. 6in. wide; while the enormous iron columns (to be presently described), which play so important a part in the constructional treatment, are supported upon huge trachyte base-stones, 3ft. deep, and weighing nearly eight tons apiece. At the level of the sub-basement floor, the usual horizontal damp-course is of Val de Travers asphalte, 1in. thick; but from this point upwards there is likewise a vertical damp-course of the same material inserted in the thickness of the main walls, and extending to the height of the retaining walls. The sub-basement contains three large chambers, with lavatory accommodation, meter-rooms, &c., while the available space is further enlarged by a considerable amount of cellarage below the footway of the street. The basement, which is floored throughout with Nepeonic of extra thickness made specially for the job, contains two spacious halls divided from each other by heavy iron doors, and lighted by windows giving partially above the street level, and partly into an area within the retaining walls, and fitted with prismatic lights. Here also are placed the cylinders for working the hydraulic gates. Access is gained from the front by means of wide descending iron staircases closed a little way down, with the space-economising Bestwick patent iron gates, and further protected at the entrance with dwarf swing railing-gates. There are likewise similar entrances from Pitt-street, and an excellent approach from a back lane, with cart docks and a hydraulically-worked goods lift capable of raising a ton weight.

The exterior of the edifice presents a style which may be best described as modern German Renaissance of a severe and slightly eclectic type. Throughout the whole design there is a commendable absence of the florid "fat" which disfigures so many otherwise fine buildings here as elsewhere, and perhaps more particularly here than there. The principal façade, which directly faces the great General Post-Office in Martin-place, consists of a long centre with two wings, the trachyte elevation of the ground floor and half-basement extending to a height of 35ft., or 57ft. to the top of the superstructure. The central portion contains three lofty semicircular-headed ascending main entrances, and two subsidiary descending ones below the ground-floor windows, while in each wing is also a window, all the windows being of corresponding form with the main entrances. The masonry is boldly rusticated with rough-hewn blocks, relieved by the tooling of other features, and further by a small amount of carving, panelling, and polishing, and the general appearance of the trachyte portion of the façade is severely grandiose and massive. Above this is a large and elaborate architectural composition, less happy in design perhaps than the remainder of the elevation, but which serves, however, to accentuate the importance of the building to the general eye, while it also softens what would otherwise have been an over-violent contrast between the colours of the two materials, and so carries the transition from the drab of the trachyte well into the ochre of the freestone. Over the centre of this superstructure is perched, upon a massive wreath which forms the framing of a lunetted window, the American Eagle, with its outstretched wings measuring some 10ft. in width, magnificently modelled by Herr Kretzchmar, and splendidly executed, in Sydney, in hammered, riveted, and brazed bronze by the Wunderlich Patent Ceiling and Roofing Company. The arch heads of the entrance and the balconettes to the windows are filled with fine wrought-iron work of extremely artistic design. Above the confining trachyte stringcourse, with its polished fascia, the central portion of the five next stories is divided into the same number of bays.

Plainly rusticated piers, a moulded stringing, and window balustradings constitute all the decoration that is employed upon the first floor and the entresol, though the windows in the wings have columns and entablatures. But in the second, third, and fourth stories the wings become more ornate, each being embellished with a Corinthian Order with pairs of columns supported upon pedestals. The general entablature extends right along the building, but broken round the wings, while beneath it the central portion is arcaded with a sub-order of Ionic character, sufficiently enriched with wreaths, *cartouches*, and other ornamental features. Above the main cornice, the fifth floor is treated as an attic, divided out by piers, and surmounted by a partially balustraded parapet. The treatment of the Pitt-street façade is similar, only that the ground-floor entrances are replaced by windows, and the central upper portion has but three bays instead of five.

On entering the building by the central doorway, an ingenious peculiarity of plan becomes speedily apparent to the technical or professional observer. A few steps lead into the vestibule with its deeply coffered semicircular-headed ceiling, its Sicilian marble wall-directory framed in golden bronze, and its black and white marble pavement; and thence are reached the main hall and staircase by glazed swing-doors, opening in an extremely handsome, architecturally-treated screen partition of solid cedar, abundantly enriched with moulded, fluted, and carved work. But on passing these doors it is seen that the hall and staircase are not planned centrally with the vestibule. The vestibule is placed on the centre line of the building, but the hall and staircase are not, though to the superficial observer they would seem to be so. A few words will explain this peculiarity of the plan, and its reason. The entire length (or width) of the building is 100ft., and the internal width of the hall containing the staircase and elevators is 25ft. Had the hall, then, been placed centrally, there would have remained on either side, after allowing for the thicknesses of the walls, about 30ft. only, as the width of the largest chamber it was possible to give, and that was not sufficient for the requirements of the "Mutual of New York." But by shifting the stairway-well some 6ft. to the left, sufficient space is gained on the right to meet the company's needs; while the placing of one of the elevators and the lowest flight of stairs directly opposite the vestibule doors not only satisfies the eye upon the score of symmetry, but immediately appeals to the sense of practical convenience. Another interesting example of ingenious planning is the carrying of the first half-landing of the staircase across the upper portion of the hall as a sort of galleried bridge. The merits of this expedient are twofold. Where, as in this case (and in many others in Sydney), a stairway has to be taken from a lofty ground floor up a well of comparatively limited area, the arrangement affords an agreeable relief from the numerous winders, or (as here) the several short, straight flights of steps, while it presents an interesting and effective architectural feature when seen from below.

Leaving for the present the general interior arrangement of the building, the special points in the constructional treatment may now be glanced at. I have already mentioned that the inside walls are of brickwork. Although the system of construction can scarcely be said to be the American system, still any of these divisional walls can at need be removed without injury to the structure itself. Such a need, however, is not very likely to arise, since the object of the architect has been to produce, not a building capable of being most easily cut about from year to year at the existing tenant's will and pleasure, but one so planned as to afford the best possible accommodation of the kind desired that the space at disposal could furnish. Still, the internal walls are removable, if necessary, without the introduction of bressummers, without underpinning, or anything of the kind, as they are carried independently of the main construction. The actual chief structural support inside of the main walls consists of cast-iron columns, steel girders, and rolled steel joists. The columns, the largest of which are 20in. in diameter, were cast vertically in single lengths, the longest ones being 27ft. The upper portions are so designed with square boxings open on the two opposite sides, that the girders, instead of simply resting on them, run right through them; while both the tops of these boxings and the bottom of the columns being flanged, they are immovably bolted together within the thicknesses of the floors. This will readily be understood by the accompanying sketch (B). The tests imposed in the specification for the iron and steel work were exceptionally severe, and those carried out in England, before the articles were shipped, were conducted under the superintendence of an ex-president of the Institution of Civil Engineers. The spaces between the joists are completely filled with concrete laid *traegerwellblech*, so as to afford a solid core for the floors and ceilings at once fireproof, damp-proof, vermin-proof, and sound-proof. In the upper surface of the concrete are laid small bevelled wood joists, to which are fixed the floorboards of $1\frac{1}{4}$in. genuine New Zealand kauri pine, secret nailed, while underneath is fitted the necessary light wooden battening, bracketing, or lining to which is attached the embossed zincwork composing the ceilings and cornices, and also the soffits of the staircase and galleries, throughout the building. The staircase, which runs from the sub-basement to the top story, is formed of rolled steel joists and stringboards incased in zincwork; the treads and risers, and likewise the balusters, are all of ornamental cast iron, with a moulded cedar handrail, and a handsome trachyte newel at the foot of the stairs; while the landings, half-landings, and quarter-landings are floored with black and white marble arranged in geometrical designs, corresponding with the vestibule and main hall floors.

The embossed zinc ceilings and cornices, capitals and bases of iron columns, and soffits and stringboards of the steel stairway are a peculiarly interesting feature of this building. Their employment, so familiar in the Palace of Justice at Vienna, and in many other important Continental edifices, is not exactly a novelty here; but this is by far the most extensive application that has yet been made of them. Their manufacture in Sydney is but a very few years old, and was introduced by two English gentlemen, brothers, and of German family, resident here, Messrs. A. and E. Wunderlich, who visited Germany to bring over the necessary plant, together with such skilled artisans as were required to give the industry a start, and to train Australian workmen in the various processes involved. After the initial difficulties incidental to most of such undertakings had been overcome, the concern was developed into the limited company already mentioned; and the works, situated in a convenient suburb of the city, now supply most of the ceilings and many portions of the roofing in the more important buildings, not only of Sydney, but of the sister capitals and many other cities and towns in Australasia. The manufacture is, in the main, simplicity itself. The zinc, in sheets, is heated to a temperature of 254° Fahr. (at which it attains its extreme of malleability), and is then passed through powerful embossing presses, or rollers, according to the nature of the article to be produced. The various portions are next trimmed, and riveted or brazed together into such pieces and sizes as are most convenient for fixing; and the more complex or important parts are finally screwed, while the lighter portions are lipped and bradded to a proper cradling fitted to receive them. In the case of some small articles—such, for instance, as *pateræ* at the intersection of mouldings—casting is found to be a more economical process than stamping, and is then employed. The zinc is usually painted directly it is fixed; and the decoration, either in oil or distemper—in the former case, two oils and flat are the extreme that is necessary, owing the non-absorbent nature of the metal, together with any gilding that may be required—can be at once proceeded with, and finished off without a day's delay before the scaffolding is struck. Moreover, so little body being required in the painting, the purer-coloured and incorrodable zinc white can be used instead of white-lead, and indeed is preferable. The extreme lightness of the material, and the cleanliness and expedition attending its use, together with other merits, have made it very popular among Australian architects, particularly as it is free from several disadvantages peculiar to either plaster or wood ceilings in this hot, variable, and sometimes exceedingly wet climate. Without describing in detail the various zinc ceilings, cornices, &c., employed in the "Mutual of New York" Building, one particular instance of the successful application of this material may be cited. The elaborate entablature in the company's public office can scarcely measure less than 8ft. in girth, and was originally designed for execution in plaster or Keen's cement. It is carried out, however, entirely in zinc, and, notwithstanding the numerous mitrings at the intersections of the beams, the result leaves nothing to be desired. I am credibly informed that this entablature is the largest piece of work of its particular kind that has ever been executed anywhere by this method of construction.

The arrangements for the installation of the electric light have been studied with exceptional care, and are exceedingly complete; indeed, a leading Sydney electrical expert considers them the most perfect of any in the colony. The building is lighted by 1,000 handsome 16c.p. Edison-Swan incandescent lamps. The installation has been effected by a Sydney electrician, Mr. G. K. Kirkland.

The twin hydraulic elevators are placed on either side of the staircase, and are contained within walls constructed chiefly of terracotta lumber, for the sake of lightness. Both run to the top floor of the building, one travelling the whole distance (108ft.), and the other starting from the main hall. The cars, which are of unusually large dimensions, are of walnut, with carved panels, angle mirrors, and top lights of cathedral glass. They run on $1\frac{3}{4}$in. Bessemer-steel rods, attached to 5in. by 4in. Oregon guides by steel brackets, the timbers being bolted to wrought-iron brackets in the corners of the well-holes.

With reference to the construction, a very few more points may be briefly noted. The walls are finished internally, from top to bottom of the building, in Keene's cement; and the same material is employed for such decorative features as are not constructed of stamped zinc. The whole of the joinery and other woodwork (except the fittings in the company's own public office) are of solid cedar, and exceptionally good workmanship; and the beauty of the grain displayed in the carefully picked stuff for the panels is almost a revelation in cedar-work, especially in the large chambers, which are all dadoed. The polished bronze-gold door-furniture has been locally and admirably made to the architect's special designs.

The interior arrangement of the building may be described in very few words. On mounting the staircase, which is pleasantly lighted by four spacious and handsome stained-glass windows of artistic Renaissance design and colouring (executed in Sydney), and further by an embossed glass lantern, the first-floor landing gives access to the company's own public office, occupying the whole right side of the structure, 66ft. deep, 36ft. wide, and 27ft. high (the height being that of the first floor and the entresol above). A row of four large columns down the centre of the chamber supports the main beams, while the rich entablature rests upon a series of corresponding pilasters, the whole being richly panelled, sub-panelled, and otherwise ornamented, and finished in particoloured decoration, the delicate hues of which are employed with excellent taste. The portion of the floor devoted to the public use is laid with black and white marble; and the Tumana wood fittings, especially the counter, with its projecting centre, its finely-panelled front and artistic divisional superstructure, all admirably designed in the richly ornate Cinquecento style, are extremely striking. The Tumana wood comes from the New Hebrides, and I believe the present is its first employment here. Its colour when polished is a sort of tawny orange, and the handsome grain is not unlike that of the Australian red bean. Leading out of this great chamber, besides the special lavatories for office use, are rooms for the general manager, the secretary, and the chief medical officer; but the most notable feature is the "inspection gallery" (an American device), which is carried round three sides of the apartment, at the level of the entresol, and from which are visible at any moment the acts and operations of every person in the public office. The gallery is partly supported upon cantilevers, and partly hung from the ceiling, and is approached both from the entresol landing of the general stairway and by a very pretty little cedar staircase worked into a corner recess of the apartment. The gallery front is artistically balustraded in cedar, and side by side with the heavy steel rods by which it is hung run the gaspipes and electric-light wires, all of which are encased in bronze to form columnar standards with projecting brackets for ornamental lights. The treatment and arrangement are not only novel, but exceedingly effective. Across the staircase landing is another large and ornamentally-treated chamber, 49ft. by 28ft., and 15ft. high (the height of the first story without the entresol), the entresol being there divided out into some half-dozen rooms intended for private offices. The second, third, and fourth floors, each with its own complete lavatory accommodation, are devoted to a number of private houses of various sizes, one of them being no less than 25ft. long, and all exceptionally well lighted. On the fifth (and top) story are placed, in addition to more offices, the caretaker's quarters, consisting of seven rooms, and a spacious general lavatory, &c., comprising baths; while hot water is laid on from a saddle-heater in the caretaker's kitchen. Above this, again, is a large tank-room containing twelve 400-gallon tanks, together with the necessary provision for inspecting the roofs by means of dormers. From the street, the two large ground-floor banking chambers on either side of the building, each with its own manager's rooms, lavatories, &c., complete, are approached by sharp flights of a dozen steps, through main entrances, closable, like the central one, by the hydraulically-worked wrought-iron gates. These gates deserve a word of special mention, not only on account of the admirable character of the design, but for their fine and particularly deft workmanship at the hands of a local craftsman—workmanship that would certainly be no discredit to Coventry or London. The bank chambers measure respectively 52ft. by 36ft. and 37ft. by 25ft., with a uniform height of 20ft. Their general treatment is much the same as that of the company's public office, excepting as to the Pitt-street windows, which are semicircular-headed and double-sashed, and, measuring, as they do, 12ft. in height by 8ft. in width, and glazed with the best British plate, are the largest in box frames ever constructed in New South Wales. The building is provided throughout with marble chimneypieces, those in the large business chambers being of porphyry, St. Anne's, and *rouge royal;* while each of these apartments contains a pair of mammoth steel safes 5ft. 6in. wide and 4ft. 6in. deep.

It only remains to be said that this exceptional edifice, which is one of the most important erected in Sydney for many years past, was commenced as recently as May, 1893, and is expected to be open by the early part of August, probably before these lines appear in print; that the cost of the building itself (including architect's commission) will probably not exceed £80,000—certainly a low figure when Australian prices are borne in mind; and that the sum paid for the land on which the structure stands was £126,000. Though certain points in the design may be open perhaps to criticism, the edifice, as a whole, is unquestionably an ornament to the commercial heart of the "City of the Beautiful Harbour"; while the manner in which the work has been carried out reflects high credit upon the building capacity and skill of Australasia, and of New South Wales and Sydney in particular.

De Libra.

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—IV.

By Joseph Horner.

FIG 2 illustrates a test-bar on supports *a*, *a*, in which the amount of deflection is much exaggerated. The bar forms the arc of a circle of very large radius. Bars do not as a rule take a regular curve under test, but they approximate thereto. When a bar is curved into an arc of a circle, the inner curve must be shortened by compression, and the outer curve must be lengthened by tension. Somewhere in the bar there must be a line of demarcation, along which neither form of stress is acting—a neutral line, or neutral axis.

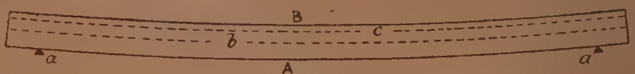

Fig. 2.

The reason why there is a section somewhere along which there is no stress, is due to the method of loading. In a bar subject to purely tensile forces, the stresses are distributed equally throughout the mass. But when a beam is subjected to transverse stress the cross-bending action must involve two opposite conditions—the stretching of the lower side A, Fig. 2, and the compression of the upper side B. These conditions are most intense along A and B; but away inwards from the lower and upper faces the intensity of these actions gradually diminishes, until the line of demarcation is reached in which neither force is in operation—the line called the neutral axis. Fracture does not occur along the neutral axis at all, but at that axis there is a point of divergence of the fractures of compression, and of tension, clearly seen in Fig. 1, in the last article. Theoretically, no strength, therefore, is required along that axis, as there is no stress; but, of course, in practice such is necessary. Along this axis there must be a connecting web, and this must be sufficiently stiff to resist side stresses or buckling. The position of the neutral axis will vary in structures made of different materials. In wrought iron and mild steel, in which the compressions and tensions are of equal value, it will lie about midway between A and B, or at *b* in Fig. 2, supposing the bar to be of equal section. But in cast iron it will lie very much nearer to the upper than to the lower flange—at *c* in Fig. 2. In the neighbourhood of this axis, holes may be, and often are, cut out without weakening girders made in cast iron.

The neutral axis of a solid bar of cast iron of rectangular section should be situated at about one-seventh of the depth from the upper edge, compare with Fig. 3, which shows a test-bar in section, and in which *c* is the neutral axis, and the full shaded portion the section in tension, and the part with broken shading that in compression. Since, too, the position of the neutral axis varies—moving upwards or downwards according to the ratio between the tensile and compressive strength of a given material—we should expect to find some variation in its position in different qualities of cast iron in which the proportions between tensile and compressive strength differ. And such, in fact, is the case, even to a considerable extent, so that instead of a relation of one-seventh, as in Fig. 3, it may range from one-fifth to one-ninth in extreme samples of grey and white iron. Test bars of soft iron always deflect more before fracture than those of hard metal. But in average cast iron it would seldom be lower down than in Fig. 3, while in a good deal of iron it would be higher up. This has been demonstrated by Mr. Barker, who cast many bars, and drilled holes through them at different depths, raising or lowering the position of the holes until he located them in such positions that the strength of the bars as compared with solid bars remained quite unaffected by the drilling of the holes. He demonstrated that a bar which had its centre cut out to leave rather less than one-seventh of the metal from the top for compression *a*, Fig. 4, and fully one-third from the bottom for tension, *b*, Fig. 4, was as strong as a solid bar. So that in a bar 2in. deep a slot 1$\frac{1}{16}$in. deep can be cut without affecting its strength. It follows, therefore, that the same proportion could be cut out of any girder or stanchion without diminishing the strength.

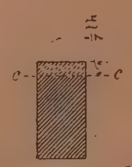

Fig. 3.

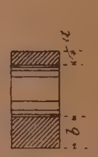

Fig. 4.

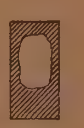

Fig. 5.

This, also, has an important bearing upon the question of soundness of castings. Castings under inspection should be condemned for blow-holes and general sponginess in some portions, while more extensive defects in other parts may be allowed to pass.

Thus, returning to the test-bar as an object lesson, it is obvious that if the hole drilled out in Fig. 4 still leaves the bar as strong as the solid bar in Fig. 3, then, obviously, if there were a hole running right through the bar, as in Fig. 5, the bar would be just as strong as though solid. Hence blow-holes in and around the neutral axis of an iron casting need not, unless very extensive, condemn a casting to the scrap-heap. Again, since iron is about six times stronger to withstand compressive than tensile stress, a few blow-holes, sponginess, or faults on the compressive side of a casting may be allowed to pass. But if they occur on the tension side, they are fatal to the trustworthiness of the casting. If Figs. 4 and 5 were turned upside-down, and loaded, they would fracture at a mere nominal load. Such matters as these are of immensely greater importance than a difference of two or three hundredweight at the testing machine, or than the presence or absence of a clean skin on castings.

It is seldom that castings of the girder type are used of the plain rectangular form like that of the test bar. That would be most uneconomical, for the same reason that it would be wasteful of material to use solid joists or solid columns. Since there are sections of these which are subject to hardly any stress at all, it would be wasteful to mass metal there which can be better distributed over the parts subject to actual stress. So that with a given quantity of metal contained in a rectangular section, a beam can be built up by judicious rearrangement of the metal, capable of withstanding a much greater load; or a beam can be made to stand the same load, with a much smaller expenditure of metal. We will consider the design of such beams in the next article; but now, before leaving the subject of test-bars, I will give an illustration of a method of testing bars which, I think, has not been described in English journals, but which has certain advantages over the common method.

In testing common bars, the load is always a dead load, gradually applied—that is, successive weights are added, or, what amounts to the same thing, a jockey-weight is moved outwards along a lever arm, until the test-bar is loaded to its breaking strength. Impact does not come in at all. A few years ago I was engaged on a lot of cast-iron crane work, which was being done for French engineers for the ill-fated Panama Canal, and in which stringent specifications for test-bars were made. Our method of testing bars by means of a dead load gradually applied was not used; but an impact test was specified. I formed the opinion then, which I see no reason to change, that the impact test is more valuable as indicative of the general suitability of cast iron for some classes of work than the dead load test. Probably very few failures of cast iron occur by reason of the excessive application of a dead load. Such failures more frequently occur in consequence of a sudden impact—a live or impulsive load—than from other causes. For a material like wrought iron or mild steel, which takes on a considerable permanent set, and a high percentage elongation and reduction of area before fracture, there can be no better test than that of a load or a pull gradually applied. But cast iron has no sensible limit of elasticity; it does not elongate or become reduced in area, but breaks off, as people say, "as short as a carrot." For such a material, therefore, the best test seems to be that of impact, which reveals the toughness and elasticity under suddenly applied stress as much as it does the absolute strength.

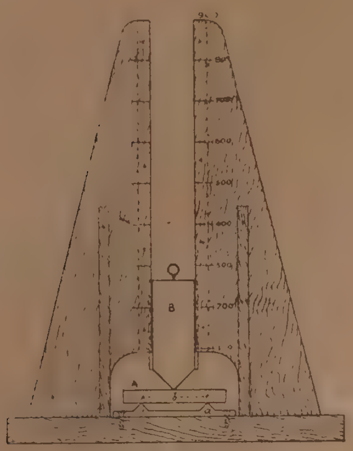

FIG. 6.

Figs. 6—8 illustrate the apparatus rigged up for testing. Fig. 6 is the apparatus in elevation, Fig. 7 a perspective view of the falling weight used, Fig. 8 a cross section through weight and guides.

The particulars of this method were as follows:—The test-bars A, Fig. 6, were 40mm. square (1·57in.), 250mm. long (9 84in.), and supported on cast-iron knife-edges, *a a*, 160mm. apart, *b* (6·29in.) A weight B, compare with Figs. 7 and 8, is allowed to descend in guides, between which it has a small amount of clearance, as shown, and to fall upon the bar, and the height from which the weight has fallen at the time of descent when fracture occurs, is noted as a measure of the strength of the bar. The weight is 12 kilos (26·44lb), and its lower edges are bevelled, but the point is rounded and blunt. Fracture occurring with a fall from a height of 700 millimètres or 70 centimètres (27·5in.), measured from the top of the bar to the top of the weight indicates a good bar. Fracture will occur between about 65cm. and 90cm., the latter indicating, however, iron of exceptional good quality. Railway-rails, which are subject to severe impulsive loads, are tested by similar means—by a falling weight. When, therefore, cast-iron work is subjected to the same kind of stress, it seems in keeping therewith to use the impact test instead of the dead load.

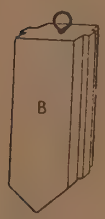

FIG. 7.

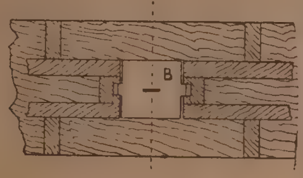

FIG. 8.

THE CITY AND THE ENGINEER.

(*Concluded from p.* 367.)

SO much for the official engineer in relation to one part of city extension. How is it with the engineer employed by the owner to lay out his property? Shall he work for one master, his employer; or two, employer and public; or the two and a possible third, himself, as judged by his work in after years? Looked at from this side it would seem that he has a hard task, but if he will carefully consider he will find that these seemingly conflicting interests will be reconciled if he can hit upon the right thing to do, have the faculty to see clearly for himself and as clearly to set the matter before others, patience to hear and weigh objections, and tact to lead those he is in contact with to choose the better thing. Often times he will need to make concessions, to do the thing he would not, but let him be careful lest he allow himself to do what he should not. There is often a broad distinction between these. A street plan must provide first of all for thoroughfares leading from centre to centre by the most direct available route. Such thoroughfares should be of ample width, 80ft. to 100ft., according to circumstances. They naturally come in time to be streets of retail shops, which require a goodly width of sidewalk, and the centre will be used for street railways; hence a less width than 80ft. should not be proposed. More than 100ft. is unnecessary and adds too much to cost. For business streets a good division is sidewalk one-fifth and between kerbs three-fifths. Grades and pavements of thoroughfares must be suited to traffic. For sidewalk paving artificial stone flagging has demonstrated its fitness and durability, if honestly laid of good material. It can be put down in most localities for less cost than natural stone flagging. For roadway paving subject to very heavy traffic trap and granite blocks will be most economical to maintain. Under moderate traffic—that is to say, of weights on wheels—sheet asphalte and vitrified brick are about the only materials now known to be fit. The day of wood street surface has come and gone thrice during my active time, and I think the material has now passed beyond consideration. Sheet asphalte is likely to acquire new popularity and to be laid at a considerable reduction of price, one of the steps to such a consummation being the development of numerous deposits of asphalte in our own country, whence refined asphalte may be distributed to any point and in the form of natural rock to many cities at reasonable cost. A promising field for a limited number of young men is to become expert in the handling of this material under the varying conditions met in its practical use. There is also need for a laboratory investigation of the properties of asphalte, so that specifications can be drawn by engineers instead of contractors. Vitrified brick as a street-paving material is rapidly coming to a prominent place. The advance in the modes of manufacture and towards uniform quality of product has been very rapid, and there is now no reason to hesitate about its adoption for fear of failure. Further progress will doubtless be made in manufacturing processes, and engineers will also come to adopt rational specifications for, and correct modes of using, this material. Good material deserves good treatment, and good treatment means good foundation. This remark is applicable to all kinds of pavement. Rapidly growing cities not having a gravelly soil to begin with are compelled to use for a season the cheapest material that can be had for street surface, the ruling consideration being that it must keep vehicles from miring. These makeshifts hardly come within the province of the engineer, for skill is not required to use them, nor science to discover their weak points. We will charitably pass over these as belonging to a temporary stage. It will assist the passage from use of temporary expedients to more lasting work, if it be understood that streets not used as thoroughfares, and especially side or back streets on which the only vehicles are the delivery waggons, do not require a wide driveway, which may be reduced to 18ft. or 20ft. For residence streets in general, the narrower the driveway the more attractive the street, if the unpaved surface be planted and well kept. The practical difficulty in the way of realising our ideals is commonly financial; but a large part of the glory and honour of our lives depends upon overcoming difficulties, and must come from obtaining desirable results with limited means. The engineer never walks in dreamland, where he might think of what he would do if unrestricted, but in the everyday world of what can be done with conditions as he finds them. Some may think that I have been leading you through a dreamland, because cities grow—we know not how or why—rather than are planned and built. Just so far as this is true those who have to do with municipal affairs are justly subject to reproach because they are not doing their full duties. The kings of olden time used to found and build cities. In modern times a Baron Haussmann had the courage to undertake the transformation of an old city according to a plan. Measures for similar transformations on a smaller scale are not uncommon in old-world cities. Cannot as much or more be done under American institutions, where we mostly have not to tear down old structures, but only to enter open fields and transform them to become the fit abode of American citizens? Many changes would need to come into our governmental ideas before what I have sketched could be realised through the regular municipal agencies, possibly the partial adoption of municipal socialism; but there is another agency that can be brought into the work. Associated capital, wisely employed, not working from philanthropic motives, but for the more sordid one of profit. We have all seen railway companies come boldly into a city and acquire not rights of way merely, but ample terminal and yard facilities, removing or razing entire blocks of buildings. We are familiar with the remorseless action of a social or moral blight which seems to fall upon sections of cities when, for any reason, they have fallen out of step with progress, which is more destructive of values than a fire and open to no remedy but change of use and reconstruction. In a few cases we have seen a coterie of men join together as a so-called syndicate, purchasing all the property within the limits they have marked out, removing everything in the shape of improvements, wiping out existing streets, and by a new layout transform the ground from inferior to better use, with profit to themselves and benefit to the community at large. Many cases have occurred where large tracts of land have been transformed from agricultural to urban uses by capital used under the skilful direction of the engineer. These enterprises have usually contemplated eventual occupancy by the wealthy, well-to-do, and comfortably circumstanced classes. A wider and as profitable field is open to those who will provide homes and home places for those who daily toil for daily bread. All that is required to realise what I have sketched is a mind to grasp the possibilities of the situation, the ability to set these possibilities before men of means and enterprise, the tenacity of purpose and executive power to carry out a plan. The engineer so gifted will find in every growing city an opening for him, none the less promising if he have one or two competitors. Cities have characteristics no less marked than men. Some exist and grow because of natural advantages, such as harbour and water transportation, without effort or the assistance of wisely designed and executed public works—e.g., London, New York, Philadelphia, St. Louis. Others have some natural advantages, but are handicapped by lack of these natural facilities for commerce, but which respond to the necessity of providing what nature denied—e.g., Liverpool, Manchester, Chicago, and Buffalo. Others have few natural advantages, but have indomitable courage and enterprise, backed by faith that he who works shall win; they go about the creation of all they want—e.g., Glasgow. The engineer is peculiarly fortunate who pitches his tent in these latter cities, for the man with ideas is in demand in such places. I cannot close without suggesting that a very important problem must shortly be solved, that of providing means for the dense masses who crowd the business heart to pass to and fro within the restricted area. I have stood at a street intersection, where street cars at one half-minute intervals during rush hours were crossing at right angles, and calling to mind the increase of movement within 10 years, have wondered what new devices would be required before another 10 years. There is a future for engineers in and about cities broader and more inviting than was before young men of my time, when the chief employment was pioneer work in the wilderness.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. MIDDLETON.

XI. — ITALIAN RENAISSANCE: CONSTRUCTIONAL ORDERS, AND THE EMPLOYMENT OF ARCH AND VAULT.

AT first sight, it is somewhat remarkable how rarely the orders were used in a constructional sense during the Italian Renaissance, until one remembers that this style was founded upon the essentially arcuated style of ancient

---

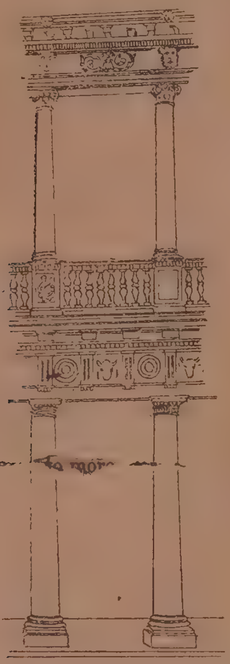
Rome, and that therefore the construction might be expected to be that of the arch rather than that of the lintel, in spite of the horizontal tendency of all ornament. It is true that there are great examples—as, for instance, the portico to the Redentore Church at Venice; but they are not many, and as showing any divergence either of spirit or of detail from what might have been expected in older Rome, are of little importance here. At the same time, such porticoes (for an entirely trabeated building of any size is not to be found) are made to harmonise with the rest of the edifices which they adorn in a manner which is entirely absent from such an example as that of the Pantheon.

In small things, however, such as loggias and the cloisters round courtyards, trabeated construction is more commonly found, and there it is usually treated with considerable delicacy. The example illustrated, from the Courtyard of the University at Padua, by Sansovino, gives a very good idea of what is meant, and other examples would only differ according to date, locality, and genius of the designer in such way as might be expected. The orders are superimposed in the two stories, as a matter of course, in correct sequence; but the most noticeable point is the wide spacing of the columns, quite opposed to ancient precedent, and apparently rather the result of habit from designing for arched openings between columns independently supported, than of study of ancient works.

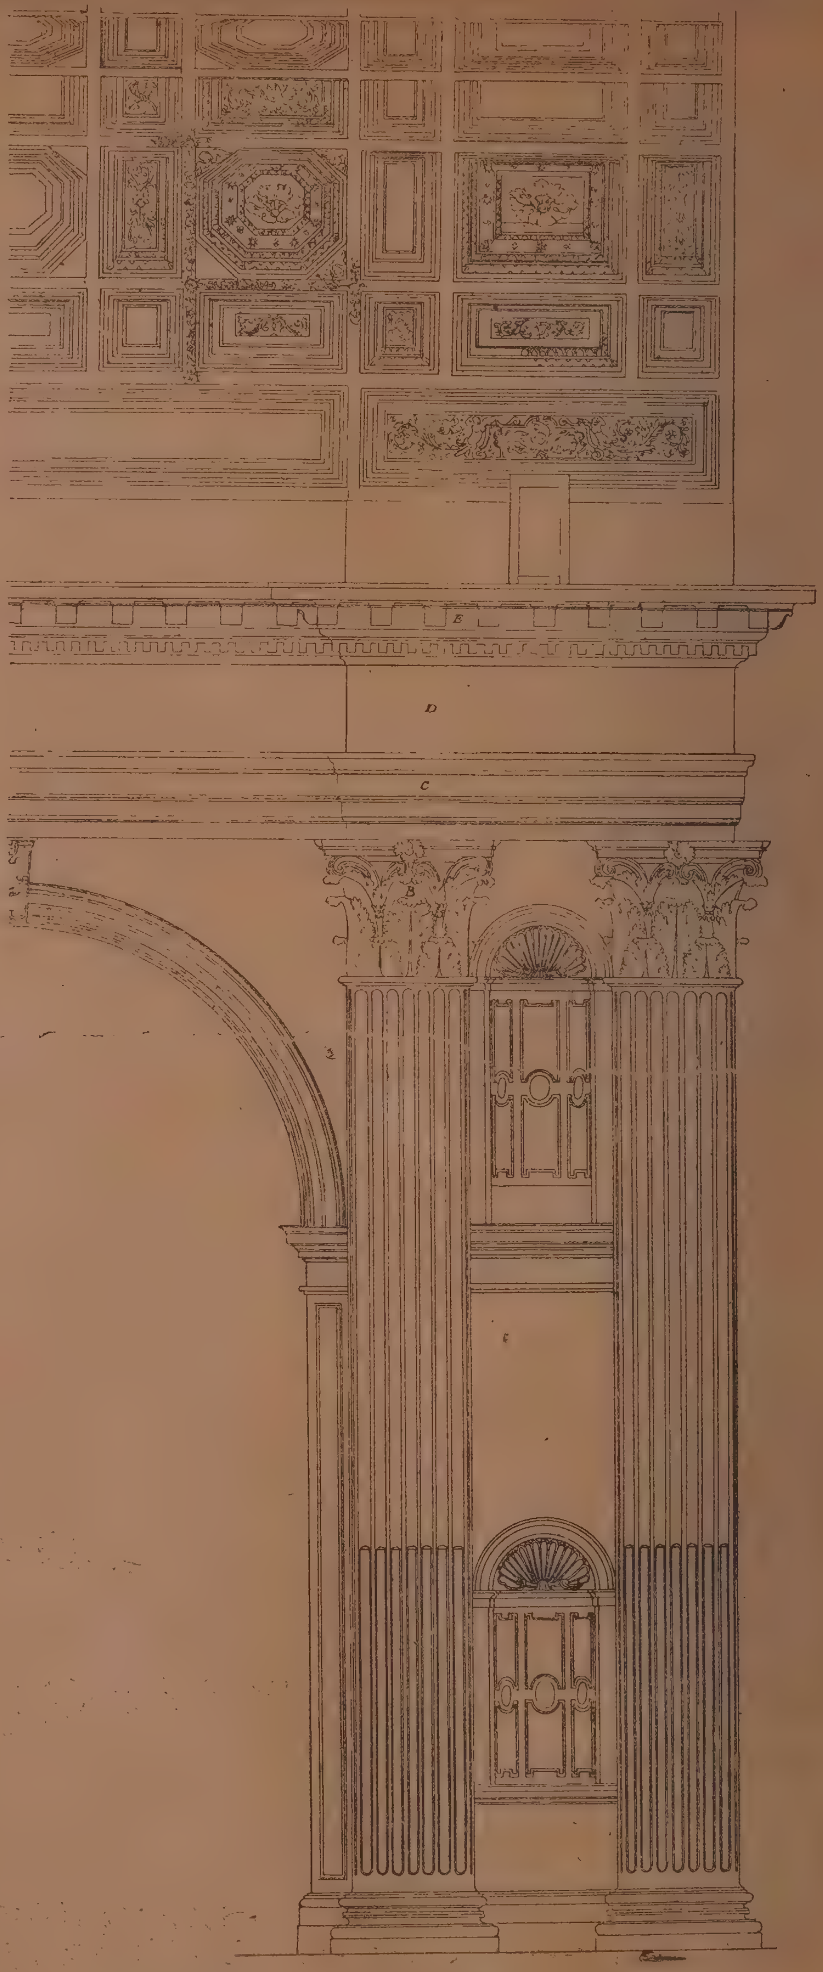


COURTYARD, UNIVERSITY, PADUA. By Jacopo Tatti Sansovino. (From Schütz.)

Even in such positions it is more common to find arches and vaults carried upon columns, or even whole orders—an entirely Gothic construction, with a Classic dress. It was done, too, without proper provision, as there would have been by the introduction of buttresses in Gothic work, for the cross thrusts of the vaulting, and in the sketch of the cloisters at San Spirito, Florence (added by Bartolommeo Ammanati to Brunelleschi's church), which accompanies this, there will be noticed the iron tie-rod which was consequently necessary. This sketch also shows how, in this instance, the small architrave and moulding over are used as a string to the trabeated construction and as upper abacus to the columns supporting arches.

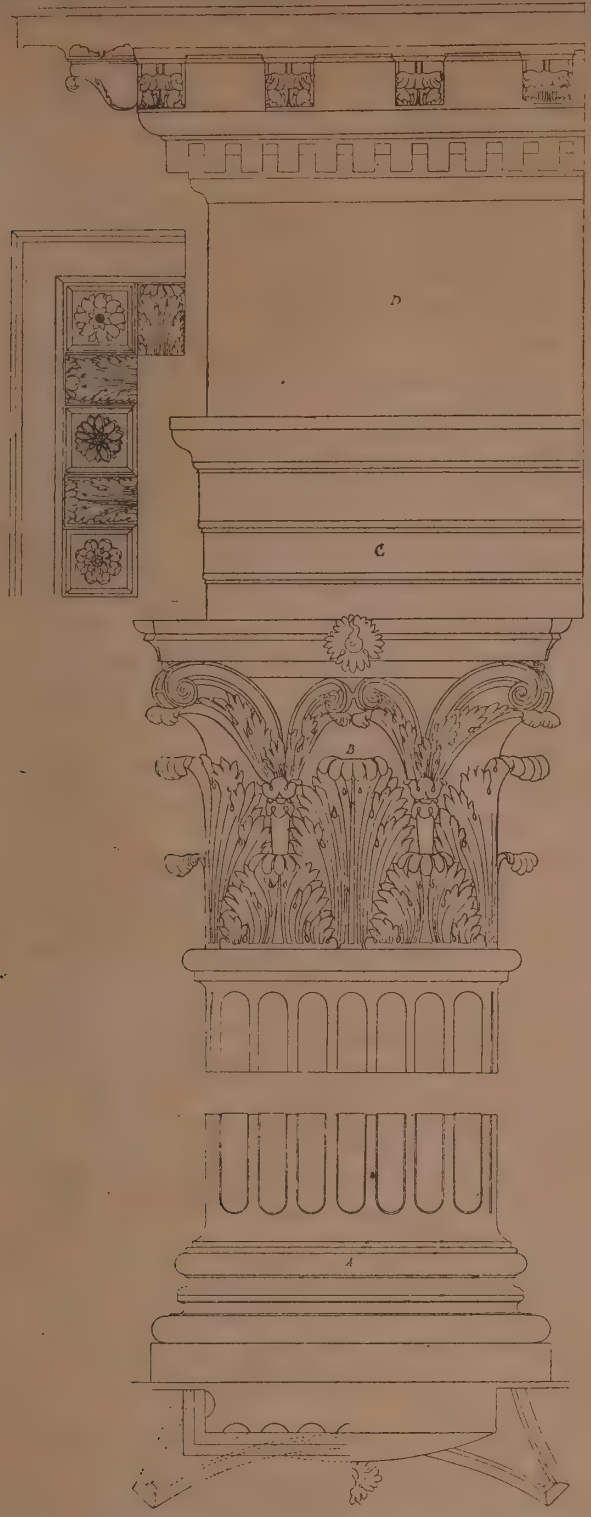
It is the same spirit which influences Bramante's courtyard of the Cancelleria Palace, and, in fact, all other examples. Here the great difficulty has occurred at the angles, and it is met by employing square piers there in place of columns, with detail slightly varied to suit the circumstances.

But it was not in small subjects only that the arch and vault were employed. The nave arcades of the churches were almost invariably arcuated, and almost as invariably the aisles at least, and generally the naves also, were vaulted; and the example illustrated, that of St. Peter's at Rome, as it is the greatest, may be considered as fairly typical of all, in spite of the natural differences of treatment in different towns, by different men, and at different times.

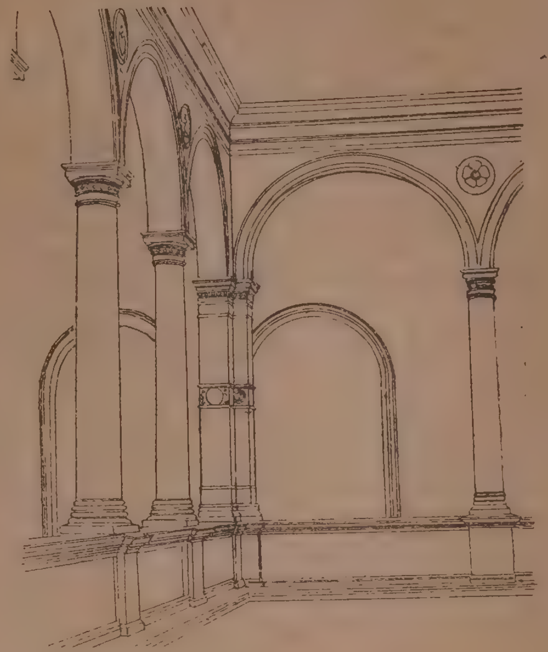


NAVE ARCADE OF ST. PETER'S, ROME. By Michael Angelo.

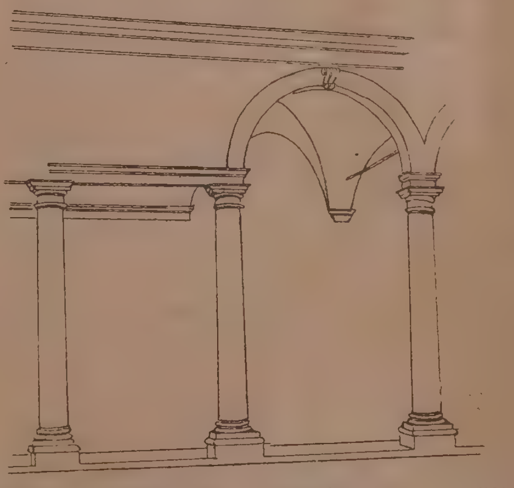
Here the arched construction is quite distinct from the applied pilasters, which cut clean through the impost moulding, and as the pilasters do not



INTERNAL ORDER OF ST. PETER'S, ROME.
BY MICHAEL ANGELO.



UPPER ARCADE OF THE COURTYARD, PALACE OF THE CANCELLERIA, ROME. BY BRAMANTE.



SAN SPIRITO, FLORENCE. CLOISTERS, SECOND COURT.
BY BARTOLOMMEO AMMANATI. (From Schütz.)

project beyond the general face so far as this moulding does, leaving the moulding projecting in profile beyond them, the effect would hardly be good were it prominently noticeable; only the huge scale of the whole almost hides the blot. The wall-surface between the pilasters is enriched by panelled, semicircular niches, having their domes coved in with the shell ornament, commonly, but quite erroneously, thought to have been employed in Venice only. It is also to be found in a wall fountain from Florence of quite early date, which is now in the South Kensington Museum.

The coupled pilasters at St. Peter's, with the entablature which they carry, form a grand Corinthian order, based, as Michael Angelo's Corinthian orders were apt to be, upon that of the Pantheon. The entablature is, however, composed of but few members, and the frieze unenriched, while every part, even the mouldings between the faces of the architrave, is well pronounced; the unity which it was to express, and the binding together of the whole internal composition which it was to effect, being thus fully established, with no excess of detail to distract attention. In fact, the entire entablature and cornice do not draw attention to themselves, but fulfil their object as being an integral part of a great whole. They form, too, the dividing line between the nave arcade and the great barrel vault which springs above the cornice, and this is profusely ornamented, with deeply recessed and moulded coffers filled with scroll work and huge pateræ.

An objection has frequently been raised to the apparent coarseness of the details near the eye level at St. Peter's—such as those of the pilaster bases. Large as they are, however, and consequently coarse if considered *per se* by little people with eyes for only that which is close at hand, yet in relation to the whole building, and to the orders to which they belong, they are but properly proportioned, and they should be judged as parts of the great whole. In fact, it is in relation to the whole thing which they decorate that all detail should be designed, and not for its own sake and for its individual self-assertion or demand for attention.

PRESERVATION OF TIMBER.

IT has been frequently stated, perhaps on the principle that "good wine needs no bush," that good timber needs no artificial preservation—in a word, no pickling. To a certain, but somewhat limited, extent this statement is true. So, also, to a much greater extent is the corollary which must inevitably be deduced from it, that inferior timber stands very much in need of some one or other of the numerous preserving or pickling processes which have been employed now for many years. The necessity for thus injecting some fluid preservative into the pores of timber depends upon a variety of conditions and circumstances, which combine in the majority of cases to so fiercely attack timber that its durability and life would be of a very temporary character unless they were fortified and prolonged by the extraneous assistance of art. It was not, in fact, until the introduction of railways that the necessity for timber sleepers arose, which were placed in a position of peculiar liability to decay and ultimate destruction, that one heard anything about creosoting, burnettising, vulcanising, and the numerous other present familiar pickling terms. Before that period, timber was selected for the particular kind of work it had to do, and for which it was the best suited. No doubt there are some good "all-round" timbers which will do fairly well under any conditions; but they are not always to be obtained, either in the scantlings demanded or at the price allowed. It became imperative, therefore—in fact, inevitable—to use what timber could be procured at a reasonable cost, irrespective of whether it was the description best suited to the purpose or not, and supply its natural deficiencies by artificial means.

Of all positions in which timber can be placed by the architect, the engineer, or the builder, and of all the duties which can be laid upon it, a railway sleeper has unquestionably the hardest time of it. All who have had to do with timber pile-driving are aware of the hammering which they undergo before they can be "got down." In earlier times, when lighter rams and much longer falls were used, the heads of at least one out of every three were frequently smashed to pieces, entailing the necessity of cutting them off, re-hooping them, and by more careful driving finally getting them home. But when once the pile was down, the superstructure erected upon it, and the whole building securely and happily brought to its bearings, the pile's trouble was over, and it might, as it has done, rest tranquilly and durably for ages. No so with the railway sleeper, which, if the name be intended as significative of the easy and indolent life it is supposed to lead, is terribly miscalled. From the moment it is laid down as part of the permanent way of a line, its miseries commence. It is exposed to all the ever-varying changes of torrid and frigid zones, and, in addition to all the fury and malevolence of the elements, it is daily and hourly exposed to the fearful pounding of the tremendously heavy modern locomotives, which carry twenty-four tons and sometimes more on a single pair of driving wheels. It is true that sleepers are in a measure protected by the ballast on the line; but on bridges and viaducts, unless these are built of stone or brick, which in modern times they generally are not, sleepers are usually laid naked, as in a large iron or steel bridge the weight of the ballast packing becomes a serious item in the calculation of its strength and cost. If we add to these elements of destruction the worms, the white ant, and other insects which devour wood as their daily food in tropical climates, it is not to be wondered at that even the pickling process fails to preserve the life of a sleeper, and that steel and cast and wrought iron are becoming more and more employed as substitutes for the older material.

In addition to the numerous preserving processes to which timber is subjected, there are other methods of treating it which are of a milder character, although their action is always directed to one and the same end. Steaming is one of these processes which greatly improves some descriptions of timber, especially beech, which, of all woods, depends most for its quality upon the nature of the soil upon which it is grown and the position of site. When these conditions are favourable, the wood is close-grained, fairly free from sap, and tough and compact, but fine in fibre. Floors laid of beech of this quality have outlasted others of oak. The operation of steaming frees the sap by breaking up the cells, and it should always be carried out as soon as possible after the tree has been felled. Mining engineers have found by experience that in dry places oak will rarely be serviceable after half-a-dozen years of wear and tear, as the dry-rot gets hold of it. When immersed in water it will hold its own, like elm, for almost an indefinite period. Another mild pickling process consists in dipping timber twice or oftener in boiling tar. Paving-blocks are usually prepared in this way, and subsequently stacked to let the surface tar run off. The difference between the action of an asphaltic or bituminous composition and that of ordinary cement in grouting in the joints upon timber paving blocks is deserving of notice. In taking up the surface of an old street, or in removing old blocks to join up new streets, the action of a cement mastic was found to be exceedingly detrimental to the strength and durability of the timber. On the other hand, the bituminous composition acted as a preservative.

It must be borne in mind that there is a wide difference between steaming, dipping in tar, and simply immersing timber in any preserving solution, and pickling it in the proper sense of the term. In the latter case, the solution must be forced by great pressure into the cells and the core of the wood, and obviously, the harder the material, the greater the difficulty and uncertainty in performing the operation. After all precautions have been taken, it has frequently, especially in sleepers, been discovered that the penetration of the preserving fluid was only skin-deep. Some woods are so hard as to render the process of pickling them neither possible nor desirable; others are far too expensive, and some, again, which would in other respects be very suitable for the process, cannot be obtained of the scantlings required. There can be no doubt that it is the softer, cheaper, and in some sense inferior descriptions of timber which benefit most by the application of a preservative. They lend themselves with greater facility to the impregnating solution, which the harder woods refuse, and which they are not by any means so much in need of. There are some conditions absolutely indispensable to insuring the success of any antiseptic solution used for preserving different kinds of timber. The preservative itself should be of a nature suitable for the purpose, and it may be mentioned here that some woods benefit more than others by the use of some particular fluid. They are not all alike valuable for all descriptions of timber; it is also of importance that the solution should, during the process, be maintained in a perfectly fluid condition. Among others, creosote, sulphate of copper, and a solution of zinc chloride may be depended upon. The first of these is still very much used at home and in some parts of the Continent. It has a comparatively low price, and its essential oil impregnates the fibres of the wood, and stays there in a condition of almost insolubility. A modified process is employed by some of the railway companies in France for injecting creosote into their sleepers and conseits. The steam is first caused to pass over the surface of a quantity of creosote, and when in a superheated state applied to the sleepers. After the action of considerable steam pressure, the creosote can be made available for subsequent occasions. Copper sulphate is seldom availed of now; but zinc chloride and a mixture of the last-named solution and of creosote are pressed into the service by railway engineers in France.

From what has been stated it is clear that under the same conditions, and the same amount of pressure, a hard wood will absorb less of a "pickle" than a soft one. If we allow an oak sleeper to absorb a weight of about 14lb. of creosote, a beech sleeper will take up 34lb., and one of pine 30lb. It is not often that the injection of the solution is pushed to the absolute saturation limit of the timber, as the heavy additional expense incurred would not be justifiable. A few words may be appropriately said respecting the vulcanising preservative process, since it not only very considerably prolongs the life of the timber, but augments the strength of it as well. The timber to be treated is inclosed in a closed iron cylinder for a period of ten hours, and exposed to a temperature of over four hundred degrees and to a pressure of 165lb. per square inch. The result is that the cells of the wood become as saturated as the process permits of by the antiseptic fluid. It appears that this process does not, similarly to some of the others, render the timber brittle, or what would be termed, if applied to ironwork, "cold short." Neither does it char it, another inconvenience to which pickled timber is sometimes exposed, or cause it to become shaky or split.

T. C.

THE SOCIETY OF ARCHITECTS.

THE "house list" of members nominated to serve as officers and Council of the Society of Architects for the session 1895-6 is as follows, the names of those proposed for re-election being indicated by an asterisk and those whose office it is proposed to vary by a dagger:—President, *Edwin J. Hamilton; Vice-Presidents (two), T. Walter L. Emden and †Silvanus Trevail, F.R.I.B.A.; Council (twelve to be elected), *C. Aubrey Bassett-Smith, Frank J. Brewer, F.R.I.B.A., †Ernest Day, F.R.I B.A., *Edgar Farman, Arthur R. Finch, *J. W. Frazer, A.R.I.B.A., *Robert Keith, *Henry Lovegrove, A.R.I.B.A., Alfred M. Ridge, Francis J. Smith, F.R.I.B.A., *George Thomas, and J. W. Walmisley, F.R I.B.A.; Hon. Secretary, *Ellis Marsland; Hon. Corresponding Secretary, *Major F. Seymour Leslie, R.E.; Hon. Treasurer, H. Goodall Quartermain; Hon. Auditor, †W. R. Mallett. The following officers, being *ex-officio* members, are not subject to election:—Past Presidents, C. G. Ellison, H. Roumieu Gough, F.R.I.B.A., George Highton, F.R.I.B.A., J. J. Lish, W. Howard Seth-Smith, F.R.I.B.A., and Robert Walker. Additional nominations for council and officers may be made by any three members, who shall send in their nomination, properly signed, to the Council before the first day of October, and the names of such nominees will be incorporated with the list proposed by the Council, which will be arranged alphabetically.

CHIPS.

The parish council of Harpenden, Herts, have agreed to purchase the local water undertaking from the private company owning it, for £7,600.

The Dowager Marchioness of Exeter has placed a memorial tablet to the late Marquis (1825-95) over the family seat in the chancel of Barnack Church. It was placed *in situ* on Friday, and is of pure statuary marble. The work was carried out by Messrs. Roberts, of Stamford.

Active operations will immediately commence for the construction of the railway from Madras to Bezwada. Mr. Edward J. Moore, engineer-in-chief, has already located his office in Cathedral House, opposite St. George's Cathedral, at Madras. Mr. Alfred Grant, examiner of accounts, has his office for the present in the same building. Three executive engineers have been appointed by the Government of India, Messrs. Boydell, Duncan, and Gerrard, and work will be begun from both termini simultaneously.

The funeral of Mr. Samuel Jones, who died at his residence in Bristol on Sunday week, aged 84 years. took place on Thursday in last week at Arno's Vale Cemetery in that city. Mr. Jones was formerly an engineer, and was associated with the famous Brunel in the construction of the Great Western main line between Bristol and Bath, and with the Box Tunnel. He was also one of the foremost of those concerned in the making of the Neath Valley Railway. He was married, but survived his wife, and left no children.

New schools for infants have just been built for the Eling School Board. Messrs. Mitchell, Son, and Gutteridge, of Southampton, are the architects, Mr. Jukes is the builder, and Mr. Loder the clerk of works.

On Thursday, the 12th inst., at the offices of the urban district council, Hendon, Colonel W. Langton Coke, C.E, held a public inquiry into the application of the local authority to borrow the sum of £879 for the tar-paving of Church-walk and Hermitage-lane. The council were represented by Mr. S. S. Grimley, their surveyor.

The Udaipur-Chitorgarh Railway (on the mètre-gauge) was opened to traffic on August 1. It is 60½ miles in length, and cost only about £2,100 sterling per mile. It extends from Chitorgarh on the Rajputana-Malwa system to a point 8½ miles below Udaipur.

A new bridge erected across the Dee at Maryculter, near Aberdeen, was formally opened on Friday. The structure consists of five spans, the one in the centre giving 94ft. of clear waterway. The piers are of solid masonry, and the girders are of steel. The roadway is carried on cambered trough flooring, the troughs being filled with concrete, on the top of which granite cubes are set and run in with asphalte. Mr. James Barron, C.E., Aberdeen, was the engineer, and the outlay has been £5,600.

The Philip-street Baptist Chapel, Bedminster, was reopened on Sunday, after having been repaired and redecorated throughout. Considerable damage having been done to the main wall of the building in Clark-street by the construction of the relief culvert, whereby the wall had been shaken, the chapel authorities had recovered £380 damages from the corporation, and while having this repaired it was decided that the schoolroom and chapel should be attended to throughout.

The Ven. Archdeacon of Kingston laid, on Saturday, the foundation-stone of the new church of St. Andrew at Limpsfield, near Oxted, East Surrey, which is to be erected at a cost of £2,000. The church is to be Gothic in style, the facings being of stone from the local quarries, and the dressings of Bath stone. The architect is Mr. Reginald T. Blomfield, M.A.

The memorial-stone has been laid of the new fever hospital for Glasgow at Ruchill Park, in a north-western suburb of that city.

ROTHERHITHE TOWN HALL.

This building, now in course of erection at a cost of £15,000, will provide accommodation for carrying on the vestry's business, including an assembly hall for public meetings in the parish. The front will face Lower-road, the side Neptune-street, and the back Moodkee-street. The main entrance in Lower-road communicates with a central octagonal vestibule, from which the various offices are entered. The principal staircase leading from the vestibule will give access to the vestry hall, committee-room, &c., on first floor, and the side entrance in Neptune-street, with staircase therefrom, will lead to the public gallery, to vestry hall, and to the coroner's court on the first floor. The public hall, with gallery, will occupy the eastern portion of the building, with the main entrances thereto in Moodkee-street, and exits will be arranged on both sides. The exterior will be faced with Portland stone and red brick, with a Cornish granite plinth, and the roofs will be covered with green Westmoreland slates. The foundation-stone was laid on Tuesday last, the 17th inst., by Mrs. Carr-Gomm, lady of the manor of Rotherhithe. Messrs. Murray and Foster, John-street, Adelphi, are the architects, and Mr. Howell J. Williams, Bermondsey-street, S.E., is the builder.

HYDRO. AND HOTEL, BLACKPOOL.

This design was submitted, last year, in a limited competition, for a new hydropathic and hotel proposed to be erected at the extreme end of the South Shore, Blackpool. After the several designs had been submitted, owing to an absence of unanimity among the directors, the project has for the present been left in abeyance. Accommodation was provided for large dining and drawing rooms, smoke- and coffee-rooms, billiard-rooms, passenger and luggage lifts, suite of Turkish baths, complete culinary department, together with 90 bedrooms. The design, as illustrated, was prepared for execution in tawny terracotta (either Burmantofts or Doulton's), to be roof-tiled with Ruabon red tiles. The architects are Messrs. Woodhouse and Willoughby, of Manchester.

NEW INSURANCE OFFICES, SYDNEY, N.S.W.

(See article, "Australian Renaissance Architecture," on page 400.)

WAXWELL FARM, PINNER.

This work consists of additions to hall, drawing-room, dining-room, kitchen offices, bedrooms, stables, and lodge, to one of the most picturesque old half-timbered farmhouses with which the district abounds. Warmth, comfort, and sanitary completeness have been carefully studied without in any way departing from the character of the ancient work. English oak (old) has been used as far as was possible in the half-timbering. The panelling with which the dining-room and drawing-room are fitted, and the internal beams, are also in English oak left unstained, while the hall and staircase partitions and open roofs, &c., are in American whitewood and plaster. Messrs. Green and Abbott, of Oxford-street, have ably carried out the work. The architect is Mr. W. Howard Seth-Smith, F.R.I.B.A.

NEW PREMISES FOR THE NATIONAL TELEPHONE COMPANY, LTD., NEWCASTLE-ON-TYNE.

These buildings, which were completed at the end of last year, cover an area of 900 super. yards, and are entirely monopolised by the above company for their Newcastle and district business. The cellar basement is utilised as large stores, workshops, and chamber for boiler for heating purposes. The ground floor consists of entrance hall from Pilgrim-street, with main staircase, large general, cashier's, inquiry, and manager's offices, and waiting-room fitted with call-boxes, porter's room, at the rear of which are placed the cloakrooms, w.c.'s, lavatories, &c., for the lady operators, with through-communication into the main switch-room, 80ft. by 35ft.—a lofty single-story building, with open dressed pitchpine roof, lighted by a large lantern light—and through this again into the instrument room. The first floor contains the district manager's, draughtsmen, and engineer's offices, with large dining-room for operators, private lavatories, w.c., and cloakroom for managers, and similar provision for clerks, together with additional instrument-room at the rear. The second floor contains the caretaker's rooms, and kitchen communicating with operators' dining-room by a lift. The entire premises are heated by hot water, and are lighted with electric light. The main elevation and part of return elevation are built in red Corncockle stone, the remaining elevation to back streets being of local brick. The roofs are covered with Westmoreland slates. The cost of the entire works was £6,500. Mr. W. C. Tyne, of Gateshead, was the contractor, and Messrs. Armstrong and Knowles, of 38, Grainger-street West, Newcastle-on-Tyne, were the architects. The illustration is taken from that exhibited in the Royal Academy this year.

PAIR OF HOUSES, TUFNELL PARK ESTATE, N.

These houses are in course of erection in the Anson-road, Tufnell Park, N., from the designs of Messrs. Truefitt and Watson, architects, 5, Bloomsbury-square, W.C. The main elevations are to be faced with red bricks with stone dressings. The roof is to be covered with Broseley tiles, and the woodwork painted white.

A BRITTANY FIREPLACE.

This is a very quaint example of the carver's art, and at one time must have belonged to a house of some consequence, as evidenced by the shield of arms with its two supporting stags. The busts filling the circular sunk panels are boldly carved and full of character: they probably illustrate in a rude manner the members of the family. They not being sufficiently numerous, apparently, to fill the two returns as well as the front of frieze, one return is filled with a spirited design of carved foliage and fruit. The work is of the early part of the 16th century; it has recently been acquired for the nation, and is to be seen at the South Kensington Museum.

◆

A new hotel is about to be built at Felixstowe from designs by Mr. W. Oldham Chambers, of London, late of Lowestoft. The contract has been taken at £9,855 by Mr. John Youngs, of Norwich, and work will be commenced at once.

A daring burglary was committed on Saturday at the office of Mr. James Nuttall, the contractor for the sewerage work at present going on in Cambridge, and whose offices are situated in Alexandra-street in that town. The amount placed in the safe in Mr. Nuttall's office ready for paying the workmen amounted to £600, and the whole of this sum was taken by the burglars. The police were aware that money was kept in the safe, and a special watch has been kept upon the premises. The thieves removed the safe from its position opposite a window, where it could be seen by the constable on the beat, replacing it with one made of wood. The safe was then forced and rifled, the robbery not being discovered till next morning. The police find that the robbery was committed by an organised gang from London, and that they have been traced to King's-cross Railway Station. Mr. Nuttall was insured, and the workmen received their wages on Saturday two hours later than usual.

COMPETITIONS.

Accrington.—In a limited competition for a new cottage hospital to be built at Accrington, the plans of Messrs. Haywood and Harrison, of Accrington and Lytham, have been placed first by the assessor, Sir Douglas Galton, K.C.B., President of the British Association, and that firm have been instructed to carry out the work. The building, which is in the Renaissance style of architecture, will provide accommodation for 20 beds, with matron's and nurses' rooms, large operating theatre, board-room, &c., and will be built of local plastic bricks with stone dressings.

West Ham Technical Institute.—The Technical Instruction Committee of the West Ham Town Council will meet to-day to consider the report of the assessor, Mr. J. Macvicar Anderson, F.R.I.B.A., with regard to the 73 designs submitted in this competition. The designs will be on view at the Public Hall, Barking-road, Canning Town, E. (station, Canning Town, Great Eastern Railway), from Saturday, September 21st to Saturday, September 28th inclusive, admission being by ticket, which may be obtained on application to the town clerk, Town Hall, West Ham, E.

CHIPS.

Mr. Ezra Hounsfield Linley, now of St. Louis, Missouri, has just presented to his church in that city a pulpit which is a facsimile of the one in the parish church of Sheffield, given by Mrs. George Wilson in memory of her husband. Mr. Linley's pulpit is the work of Mr. Forsyth, of London.

The small Gold Medal for Painters has been conferred upon Mr. John S. Sargent, A.R.A., in connection with this year's Berlin Art Exhibition.

A Students' Union is about to be added to the buildings of Queen's College, Belfast, which celebrates its jubilee this year. The plans have been prepared by Mr. Robert Cochrane, F.S.A., F.R.I.B.A., of H.M. Office of Public Works, Dublin. Tenders have been accepted, and the total cost, with furnishing, will be about £7,000. The building will be commenced forthwith, and it is expected it will be ready for occupation by students at the beginning of the session after next.

The owner of the Bathwick Estate has intimated his intention to ask the town council of Bath to accept the fields known as Henrietta Park, containing seven acres, as a public park for the benefit of the city.

At the Established Church at Strathpeffer on Sunday week, a new organ, which has been in course of erection for some weeks by Messrs. Ingram, of Hereford, Edinburgh, and London, was formally inaugurated.

On Tuesday week a dedication service was held in All Saints' Church, Leek, on the occasion of the opening of the new organ, which has been built and placed in the church by Messrs. Jardine and Co., of Manchester. The cost of the organ, without the case, which it has been decided to defer providing, has been £560.

The vicar of Dawlish being desirous of restoring the tower, pinnacles, and buttresses of the parish church, a committee has been formed to consider the question. The estimated cost of the work is considered by Mr. Dobell, the architect consulted, to be about £1,500, and the first third of that amount has been promised.

The name of Thomas Daniell, Bennett's Mews, Stamford-street, S.E., builder, occurs in Friday's list of adjudications in bankruptcy published in the *London Gazette*.

After much discussion, the Blackpool Town Council decided on Friday to lengthen the promenade in a southerly direction, the extension to cost £16,000. Another important improvement decided upon was the widening of Hounds Hill corner on the promenade, the purchase of the necessary land costing £6,000, whilst a scheme for widening the whole extent of the promenade was mooted.

The water board of Swindon have adopted the plans of Mr. James R. Shopland, of Swindon, their engineer, for covering the service reservoir, which measures 154ft. 6in. by 158ft. by 16ft. in height, with arching supported on concrete piers.

A new set of pumping engines has just been inaugurated at the Hereford Corporation Waterworks. They cost £3,800, and were constructed by Messrs. Worth, Mackenzie, and Co.

The members of the North Staffordshire Archæological Society visited Matlock, Cromford, and Wirksworth on Wednesday week.

A group of Sunday-school buildings are about to be built at New Mills, near Tring. Mr. W. Huckvale, of Tring, is the architect, and Messrs. Honour and Sons, of the same town, are the contractors.

Building Intelligence.

Balsall Heath.—The Right Rev. Bishop Ilsley laid on Thursday, the 12th inst., the foundation-stone of a Roman Catholic Church, which is to be erected in George-street, Balsall Heath. The church, which will be dedicated to St. John the Evangelist, will consist of nave, aisles, with octagonal-ended sanctuary, two chapels, and sacristy at the east end, and porch, baptistery, and organ gallery at the west end. The north aisle, however, will not be built at present, though the piers and arches will be provided. The building, which has been designed by Mr. Vicars, of London, and is being erected by Messrs. Harley and Son, of Smethwick, will be in the Early English style, the material being brick with Bath stone dressings, and will have an open-timbered roof, panelled. The ultimate size of the church will be 107ft. by 44ft., giving accommodation for about 400 worshippers. The cost will be about £3,500.

Birmingham.—Messrs. Barrow, Limited, have in course of erection new premises, consisting of stabling, van-houses, covered yards, dwelling-house, &c., situated (on the Birmingham Improvement Scheme area) in Dalton-street. This building will have a frontage of 51ft., and depth of about 90ft., and will be three stories in height. The dwelling-house will face the street, and will be of modified Gothic character, with best red brick facing and terracotta enrichments. The stable building will consist of van-houses, loose boxes, and "inclines" on ground floor; stalls, loose boxes, and harness-room on first floor; and store-rooms, &c., on second floor. The building will be mainly of fireproof construction, concrete and steel girders being extensively used for flooring and other purposes. The total cost of erection will be about £2,600. The architect is Mr. J. Statham Davis, of Dolobran-road, Sparkbrook; and the contractor Mr. Thomas Rowbotham, of Coventry-road, both of Birmingham.

Grahamstown, S.A.—The new chancel of the Episcopalian Cathedral at Grahamstown will be consecrated on All Saints' Day. The cathedral was originally designed by the late Sir Gilbert Scott, R.A., and a perspective view of the completed edifice with plan appeared in the Building News for March 22, 1889. The fine tower and broached spire at the west end were built some years since; but the nave is, we believe, still a temporary structure. The chancel approaching completion is from revised designs by Mr. J. Oldrid Scott, F.S.A., of Spring-gardens, S.W. It is 60ft. deep by 40ft. wide, and is carried out in stone, the fittings being of mahogany. At the south-west angle are two vestries, with organ-chamber above.

Shirley.—New schools in Shirley-road, built for the School Board for Millbrook, near Southampton, were opened recently. They have been designed by, and erected under, the direction of Mr. A. F. Gutteridge (of the firm of W. H. Mitchell, Son, and Gutteridge, architects, of Southampton), with Mr. H. W. Randall, of Woolston, as clerk of the works. The work has been executed by Mr. H. Cawte, builder, of Shirley, whose contract price was £10,250. The main block of buildings consists of three schools, planned to accommodate 950 children—viz., 300 boys, 300 girls, and 350 infants. The leading principle in the arrangement of each school is a central hall, around which are placed five classrooms; these communicate with the halls by glazed screens and doors, the lower portion having cupboards. That and cloak lobbies and lavatories are provided at each entrance for the children; also rooms for the use of head and other teachers, with lavatories. The buildings are erected of red bricks, with Portland stone copings and sills, the finishings to exterior brickwork being of Bracknel bricks. The buildings are covered with slates, finished with ornamental bands of permanent green. A prominent external feature is the ventilating and smoke-shaft, which rises to a height of about 80ft. Internally the floors are formed of cement concrete, upon which wood blocks have been laid by the Westminster Wood-Block Flooring Company, excepting lobbies, lavatories, and offices, which were laid with Limmer asphalte by Mr. Bradshaw, of Portsmouth. The whole of the walls are plastered and distempered, the dado being finished with Keen's cement. The woodwork is of red deal, stained and varnished. On the first floor in the centre block is the board-room. The windows throughout are of large dimensions, with semicircular heads, the lower portions having sliding sashes. The upper portion of the windows is fitted with hanging lights, and glazed with tinted cathedral glass, while all are fitted with Leggott's patent opening gear. The premises are heated throughout on the hot-water low-pressure system, with ventilating radiators placed in the central halls, rooms, and corridors. The vitiated air is removed by foul-air extraction flues, with inlets at the ceiling and floor-levels, connected with an air duct, through which it is drawn to the shaft by means of a separate furnace in summer and the boiler furnace during the winter months. At the end of the infants' school is situated the cookery school, provided with close and open ranges and gas cookery stove and desk accommodation on solid platforms, with other conveniences for the teaching of cookery. The caretaker's cottage adjoins, and consists of six rooms, with offices. The offices, with play-sheds adjoining, are placed in the rear of the yards, the roofs of which are covered with rolled plate-glass and Braby's patent zinc roofing. They are fitted with Merrill's latrine troughs, with automatic flushing cisterns. The whole of the playgrounds are being covered with tar-paving by Messrs. Hobman, of London and Maidstone. The schools throughout have been furnished by Messrs. Illingsworth and Ingram, of London and Leeds, the desk adopted being their dual desk of American oak.

Tamerton Foliot.—This 15th-century parish church, near Plymouth, was reopened on Wednesday week. During the early part of the present century it was allowed to fall into a bad state, and the interior was very much disfigured by an ugly west-end gallery and large box pews. In 1850 it was found desirable to almost rebuild the south aisle, to restore the roof, and reseat the church. The north aisle remained in a very dilapidated condition until recently, and in 1891 two trees fell across the eastern portion of the north aisle, doing irreparable damage to the roof. The restoration of the aisle and the rearrangement of the church, so as to provide space for a properly-fitted chancel and a new organ and vestry, have now been carried out from plans by Mr. G. H. Fellowes Prynne, of London and Plymouth. The work included in the contract just executed provided for a new aisle and heating chamber. There is also a new chancel, and five steps now lead from the nave to the altar, giving greater dignity to the east end. The sanctuary steps are of white Sicilian marble, and those leading to the chancel of granite. The new organ, built by Messrs. Hele, adjoins the south side of the chancel.

Upton, Chester.—A special meeting of the Cheshire County Council was held on the 12th inst. to deal with a report of the finance committee submitting an additional estimate of £11,000, beyond the estimate of £80,000 previously submitted, for carrying out the enlargement of the Upton lunatic asylum. The committee of visitors reported that they had thought it advisable to obtain from the architects, Messrs. Grayson and Ould, of Liverpool, an explanation, in writing, of the excess of the builders' tender over their original estimate. It was found possible to make such modifications in the bills of quantities as would effect a reduction of £9,059 in Messrs. Jones and Sons' tender of £79,500, which had been agreed to. The committee therefore submitted the following estimate of the total cost of carrying out the plans approved by the council:—New buildings as per revised tender, £70,441; outfall drainage, lighting, and furniture, £8,744; architects' commission and cost of quantities, £4,387; clerk of works, £500; farm buildings as per contract and architects' commission, £2,865; total, £86,937. The sum, it was explained, did not include the isolation hospital for the twelve beds, which would require an extra £3,500. The chairman of the committee moved that a further sum of £11,000 be granted, in addition to the £80,000 already sanctioned, for the purpose of carrying out the enlargement, and that the visitors of the asylum be empowered to enter into contracts not exceeding £91,000. He remarked that the disparity between the lowest tender and Messrs. Grayson and Ould's original estimate was accounted for by the fact that the architects' estimate was made two years ago, since which time there had been an advance in wages, with a prospective further advance. There was a difference in the brickwork alone of £4,000. The architects' figures were based on the figures which applied to Rainhill asylum, and the difference between the price there and the bricks that would be required for Upton was roughly about £4,000. Another element in the excess was that, after a close inspection, it was found that the foundations would have to be carried to a greater depth than could possibly be anticipated. Alderman Thomas Beeley severely criticised the committee, observing that the total cost at first was to be £40,000, then £50,000, then £90,000, and again £100,000, and now it had fallen back to £91,000. Dr. Hewitt explained that the original figure of £40,000 or £50,000 given by the committee was merely a repetition by them of what Dr. Davidson, the asylum superintendent, had said he thought the work might be done for. Ultimately the resolution and the recommendations of the committee were carried unanimously.

◆

CHIPS.

The partnership heretofore subsisting between E. F. Titley and J. A. Jones, architects and surveyors, Birmingham, under the style of Titley and Jones, has been dissolved.

The Sites and Plans Committee of the Court at Aberdeen University have approved of plans submitted by Mr. Mackenzie, A.R.S.A., of the tower to be erected at the extremity of the north wing of Marischal College, fronting Broad-street. The plans show a lofty structure of dressed granite.

Mr. Oliver E. Winter, the deputy city engineer and surveyor of Norwich, has been appointed the surveyor of St. George the Martyr, Southwark, in succession to Mr. A. M. Hiscocks, C.E., who retires on a pension.

The Hardman Institute at Milton, near Burslem, was opened on Thursday, the 12th inst. On the ground floor there is an entrance-corridor, with a reading-room, 24ft. by 17ft., a coffee-room 21ft. by 20ft., and a billiard-room, besides a library and rooms for domestic use. The upper floor consists of a concert and lecture room, with seats for 250 persons, and other accommodation. The walls of the corridor and the room on the ground floor are lined with salt-glazed bricks and enamelled tiles, dado height, and the floors are laid with wood blocks. Externally the elevations are of red brick, relieved with moulded brick bands and terracotta. The tower, the height of which is 50ft., rises over the main entrance. The architects were Messrs. Dains and Son, and the builder is Mr. Moss.

At the London Auction Mart last week a fair number of sales were held, but all of an uninteresting character, and the days' totals were but small. The aggregate for the week was £16,507 only, but there is every prospect that the autumn season will be a busy one.

The new electric light works in Sandy-lane, Coventry, are approaching completion, and will be opened by the Mayor in about a month's time. The building contract, which was commenced in July, 1894, was intrusted to Mr. C. G. Hill, and the contract for the supply of the machinery and plant to Messrs. John Fowler and Co., of Leeds. The building, erected from designs by Messrs. G. and I. Steane, comprises engine and dynamo house, and switch room adjoining, boiler-house, coal stores, offices, electrician's room, and other accommodation, with space for extensions at one end.

It is expected that the new National Portrait Gallery will be ready for opening to the public some time in November next, if not sooner; the work of transferring the various collections from Bethnal Green is practically complete.

The British school at Gladstone-road, Boscombe, is being enlarged by the addition of an infants' department at the rear, from the designs of the architects of the present block, Messrs. Lawson and Donkin, of Bournemouth.

A new Established church in the lower reach of Glenfalloch, in the parish of Arrochar, and about a mile from the head of Loch Lomond, was opened on Friday. The church is seated for 100 persons, and has been built from plans by Messrs. John Burnet, Son, and Campbell, of St. Vincent-street, Glasgow.

A fire occurred on Tuesday week at a three-story building occupied by Mr. James Deacon, master joiner and builder, Shipley. The building extends from Wharfe-street to Wainman-street, and the damage done amounts to £2,000. This is the third time that these premises have been burnt down.

The proposal to raise £12,000 as a memorial to the late Sir Andrew Clark, to be devoted to adding a block of small wards to the London Hospital, has practically failed, less than a fourth of the suggested sum having been subscribed. Two small wards and extra rooms for porters will now be the outcome of the movement; but should funds permit, the suggested wards can be placed over these as additional stories at a future time.

ARCHITECTURE AND THE APPLIED ARTS AT LIVERPOOL.

THE City of Liverpool School of Architecture and Applied Arts commences its second session on the 1st of October next. Mr. Frederick M. Simpson, Roscoe Professor of Art, is the director, and Mr. Arthur Stratton the demonstrator. The other teachers are Mr. C. J. Allen for sculpture and wood-carving, Mr. R. Anning Bell for painting and drawing, and Mr. J. Platt for wrought iron. The school aims primarily at effecting a complete union between the different arts and crafts. To produce this unity, it is considered necessary that the students in the different crafts should work side by side in the same studios. It is not enough that the students of the three arts of architecture, sculpture, and painting should be together; with them will also be associated the stone and wood carver, the designer in stained glass and in textile fabrics, the furniture designer, gold, copper, and iron smiths, and workers in other crafts. The men will, it is hoped, by this means not only get into touch with one another, but will also gain that insight into each other's work which is absolutely necessary if their own is to be brought into harmony with it. Most modern work fails because each craftsman knows nothing at all about his neighbour's craft. The school also provides in its studios and classes a course of training for students in the different arts of painting, sculpture, and architecture, and special instruction of an advanced kind for skilled craftsmen and artisans, especiallly in those crafts allied to architecture.

The school consists of: (1) the architectural studio; (2) the sculpture and modelling studio; (3) the decorative painting studio; (4) the wrought-iron workshop; and (5) the wood-carving workshop.

The architectural classes are held in the Victoria Building, University College, the others (with the exception of the wood-carving) in the building specially erected for their accommodation on University College ground, with a separate entrance from Browalow-street. The wood-carving class is carried on, at present, in the wood-working department belonging to the engineering department, University College.

In the architectural studio, the course of studies is so arranged as to meet the wants of two classes of students: those already engaged in architects' offices as pupils and assistants; and those who intending to become architects, shall pass through a course of architectural training before entering an architect's office.

For the latter class of students the course of training extends over two years, and embraces freehand and architectural drawing, construction, and a knowledge of building materials; design, both elementary and advanced; the history of ancient and mediæval architecture, mechanics, modelling, &c.

Students entering for the complete course pay a composition fee of £25 for the session of three terms.

It is hoped that those who intend to be builders will take advantage of the course, as well as those who wish to become architects. Two free studentships are offered in each of the five divisions, as well as money prizes.

COUNTY LUNATIC ASYLUMS.—XXIX.

By GEORGE H. BIBBY, F.R.I.B.A.

THE ASYLUM FARM.

THE extent to which farm buildings should be provided in connection with asylums must depend necessarily upon circumstances connected with the locality; whether the district from which the patients are drawn be an agricultural or manufacturing one, and, if the latter, whether it be practical or profitable to teach or employ patients upon works which they may have been previously unaccustomed to perform.

A large proportion of the male patients in many asylums are employed upon the farms, gardens, roads, &c. The agricultural works executed by them are often of considerable value to the various institutions, whether regarded as a desirable bodily occupation leading to mental improvement, or as a profitable investment of their labour upon the land; potatoes, cabbages, and various vegetables, as well as hay, oats, rye, grain, mangold-wurtzel, &c., are produced for consumption on the estate, and are often an important consideration, having regard to the exceptional circumstances relating to the nature and value of the labour of the insane patients, and matters of a kindred nature.

And even the care of dumb creatures, horses, cows, pigs, poultry, &c., is calculated in some instances to foster those habits of thought and consideration for others than self, which have so salutary an influence upon the lives of all. With many, sane as well as insane, it is an intense concentration of thought upon self that leads to so much misery. Occupation for mind and body is good for all, whether it brings in a pecuniary return or otherwise; but as a rule the produce resulting from the works performed by patients on an asylum estate should show at least a bare profit, if only by reason of the low cost of the labour.

Sewage-irrigation of the asylum estate is carried out in many instances with more or less success. It should be with fresh sewage, the volume made each day being passed over some portion of the land, and never stored in tanks. An area specially prepared should be provided to act as a sewage filter for the outflow of the whole asylum sewage. The land requires to be specially prepared and worked for effective sewage irrigation, and should be broken up to a depth of 18in. at reqular intervals not exceeding two or three years, either by deep or double ploughing, or by spade labour, thus loosening and working the soil and subsoil so as to enable the sewage to become incorporated with the earth. In irrigation there must not be stagnation, either on the surface or amongst the subsoil. The land should be so laid out that the "carriers" will distribute the sewage in a thin film over the whole surface, and the subsoil drains should be so contrived that they may regularly remove the subsoil water. Under such conditions as these, the use of special means of deodorisation would seldom become necessary; but the sewage-farm should, of course, be placed as far away from the asylum main-buildings as may conveniently be arranged.

In arranging for the plans of the asylum farm-buildings, consideration must obviously be given to the numbers of male patients capable of outdoor employment, the nature of the soil, and the extent of the asylum estate. In the Banstead Asylum there are about 2,000 patients, of whom rather more than 700 are males. The following table gives the areas and appropriation of the land:—

	A.	R.	P.
Site of the asylum	13	0	0
Recreation grounds—males	7	0	0
Recreation grounds—females	13	0	0
Farm buildings and gas-works	1	1	0
Dwellings and mortuary	0	3	1
Cemetery	2	0	0
Roads and boundary walls	5	1	1
Kitchen garden	8	0	0
Arable land	49	2	38
Fairlawn Field—Arable	17	2	30
Total	117	2	30

In the asylum farm-buildings here, provision is made for the accommodation of 203 pigs, 40 cows, 8 horses, and some 60 or 70 head of poultry, also buildings for the storage of implements, tools, &c., for garden and field use, and for the reception of carriages, carts, harness, roots, hay, seeds, manure, and other farming matters. About 50 of the patients are stated to have been occupied about the farm—that is, about one to every 14 of the male patients in the asylum were employed upon the farm roads, kitchen gardens, fields, and cemetery land, &c.

Conservatories should also be provided to a moderate extent, from which flowers and plants can be produced for use (especially in the wards for the sick and infirm inmates) for the decoration of the day-rooms and the dining and recreation halls. The position of the conservatories and greenhouses, however, depends much upon the general arrangements of each asylum, in some instances being conveniently placed near to the medical superintendent's residence, and under the general control of the foreman gardener.

I have mentioned several of the occupations of patients, in connection with which it is necessary that the asylum architect should provide rooms or sheds, and have pointed out that many works and improvements may be deferred, for the sake of economy, to be completed by the patients after an asylum has been opened. There is yet another work which may come under the supervision of the asylum architect or enginerr, and that is road-making. These officials have to arrange and provide for the several roads within the estate of the asylum, as well as, at times, for the approaches thereto. This involves a large expenditure, especially when the asylum is located in a district where labour and materials are scarce or unsuitable. Some of the roads require to be laid in a most substantial manner, and this will be admitted if it be considered how many thousands of tons of coal, provisions, and materials (compelling traffic of a heavy nature), must pass to and from an asylum of even moderate dimensions. Some of the roads should be formed before the building of the asylum is commenced, to enable heavy masses of stone, bricks, and building materials to be brought to the site with due economy (unless, indeed, a branch railway be laid directly up to and on to the asylum site in connection with the nearest main railroad. This course has sometimes been found the most economical, and contractors have often found it to be worth their while when executing such work upon a large scale to lay a line of rails of very considerable length at their own cost, in order to save the expenses of cartage; this plan was adopted, I believe, at the Claybury asylum, and also in the extensions to the Essex County Asylum at Warley, near Brentwood).

Some authorities are of opinion that it is better that a roadway should be *undulating* rather than level, it being contended that the horses are eased by the change of position of the harness and load, and that they are thereby less fatigued on a road with slight ascents and descents than on one that is of a dead level. There may be some foundation for the theory that a horse finds relief by having his harness and line of traction varied, but there can be no reason for asserting that an *undulating* road is preferable to a level one as a means of diminishing the expenditure of muscular power. It is quite true that level roads are occasionally more difficult for horses than undulating ground, especially on low levels, but this is not because the road is more level, but because it is frequently more soft and wet, and so productive of greater friction than when on higher and firmer ground. There is no more exhaustive road than a sandy plain; but this is not because it is level, but because it is sandy and soft. Coachmen and others who extol the advantages of undulating roads, do not, it may be believed, reason very deeply on the matter, and wrongly ascribe to the horses the satisfaction they themselves experience from a change of position, while the horses probably feel no other satisfaction than that which temporarily arises from the diminution of their burden on descending an incline, and there can be no doubt that all roads to asylums, both within the estate and from the neighbouring towns, should be as level as circumstances will admit, and should be made with a hard and smooth surface so as to resist the pressure of heavy loads. The removal of large quantities of earth and rock is usually a very expensive process, but even in the formation of ordinary roadways it is too generally neglected. This, when it arises from insufficiency of funds is to be regretted; but the first expense of the formation of a road is but small in proportion to the permanent diminution of power from imperfect construction and cost of repair. There is no doubt that loss in a great many cases arises through undervaluing the importance of level roadways and the effects of ascent and descent on the force of traction. The roads should be as straight as possible, and if made curved or winding to avoid inequalities of levels, the curves must not be sharp or sudden.

These questions of asylum roads, farms, and sewage irrigation are, therefore, of special importance, not only for reasons of economy, but also as offering opportunities of useful labour by the male patients, and with regard to that of sewage-irrigation, the Commissioners in Lunacy have long since considered it desirable to issue practical suggestions (*to asylum authorities*), by Sir Robert Rawlinson, K.C.B., who states that sewage may be used for agricultural purposes with advantage if proper knowledge and care are made available; that it contains the elements of every field or garden crop which is grown, and may be applied to both root and vegetable crops, &c.; and that for surface irrigation not less than one acre to each 150 patients should be provided, unless the land is very porous and is especially prepared to act as a filter; and gives much other useful information upon the subject generally.

Very frequently the asylum estate, prior to its purchase for the use of the insane, consisted of farm land, more or less suitably drained and prepared for the purpose; but occasionally the property had fallen out of cultivation, and in various respects required much work in excavations, levellings, embankments, and drainage. A certain quantity of water is essential to healthy vegetable life; but an excess of it contained in the soil becomes injurious to the greater number of the kinds of plants required to be produced, which suffer from the effects of a continued saturation of the ground. When land is surcharged with water, the air is prevented from due access to the pores of the earth, and actions take place in the soil which retard the decomposition of putrescent manures applied to it, and impair the utility of some of mineral origin; the seeds of the plants frequently perish, and plants not aquatic in their habits grow feebly when their roots are thus in contact with water stagnant in the ground. The temperature of the *saturated soil* is colder by several degrees in the months of spring, summer, and autumn than when the ground is dry; and when saturation takes place in the winter a longer period elapses before it can acquire a temperature favourable to vegetation. The water retained in the soil may either be retained by the particles of the earth by cohesion, or may fill its pores and interstices, unable to make its escape. It is in the latter condition that it may be supposed to be injurious to the soil and growing plants. The care of the drainer must therefore be directed either to prevent this accumulation of water in the soil, or to remove it by forming for it outlets by which it may pass away.

As may be seen by a comparison of the following tables of areas of land at the Claybury and Hanwell asylums respectively, there is a considerable difference in the extent of the land attached, although each asylum is alike capable of providing for about 2,000 patients. Hanwell Asylum was opened about the year 1831, while Claybury Asylum was not opened for the admission of patients until May 16, 1893; but the latter asylum estate also provides accommodation for a few private paying patients.

HANWELL ASYLUM.	A.	R.	P.
Site of the asylum and buildings	8	1	29
Farm buildings	1	0	2
Shrubberies	2	0	0
Airing courts (male)	8	3	38
Ditto (female)	8	1	30
Cricket ground	5	0	0
Burial ground	1	2	30
Water in dock	0	0	28
Laundry-yard and drying-ground	0	2	0
Roads and yards	6	0	0
Brent Island	0	2	15
Kent Lodge	0	1	30
Kitchen garden (including paths)	2	2	0

New Field ,, ,,	19	2	19
Brent Meadow ,, ,,	6	0	0
Viaduct Field ,, ,,	18	2	0
Total	103	0	9

Although also intended for about two thousand patients, it will be observed that not only is there much more land attached to the Claybury asylum, but also the airing courts and buildings cover a much more extensive area than at Hanwell, where 151 men work on the land.

CLAYBURY ASYLUM.	A.	R.	P.
Site of asylum, including four internal airing courts	20	0	0
Recreation grounds and airing courts	20	0	0
Isolation hospital and mortuary	2	0	0
Mansion, stables, yards, and grounds	9	3	0
Old lodge and garden	0	2	3
Steward's house, lodges, and plantations	5	0	38
Farm buildings, cottages, gas works, &c.	6	3	30
Kitchen garden	10	0	0

Roads and footpaths	8	0	0
Woods	49	0	0
Arable land	49	1	30
Pastures	81	0	20
Boundaries and fencing	3	0	35
Total	269	2	20

In connection with the farm-buildings, one or two cottages for labourers might be arranged for. At the Hanwell Asylum, in addition to the farm working patients, there are about a dozen labourers and gardeners employed about the grounds, and only two of these are housed at the cost of the asylum. These are as follows:—One vegetable-shed labourer, five general labourers, three gardeners, one carter, and two cowmen. The custom as to providing cottages for these classes varies in different districts, and where the county asylum is situated at a considerable distance from a village or town, it is frequently necessary for the asylum architect to provide a number of small cottages either upon or within a reasonable distance of the asylum estate, *in addition* to those to which I have before referred as necessary for the accommodation of artisans and workpeople constantly employed upon the estate, and for the married attendants and others. If placed on the asylum estate, most of these cottages should be placed near to the public roads, and not near the centre or distant parts of grounds, unless there be special reasons relating to aspect and altitude, &c., and the cottages should *not* be midway between the fever hospital and the asylum. The one or two cottages required by the farm labourers, &c., might conveniently be located near to the asylum farm-buildings.

(*To be continued.*)

KIRKSTALL ABBEY.

THE ruins of this Cistercian Abbey, at Leeds, are interesting fragments of the monastic splendour of the 12th century. The abbey was founded in 1147 by Henri de Laci, Baron of Pontefract. It was first established at Barnoldswick-in-Craven, but afterwards the Order removed to Kirkstall, and on the site of the present ruins erected a temporary church. The present church and claustral building were completed during the life of the first abbot, who died in the year 1182. At the general dissolution of monasteries, in the year 1540, the abbey was surrendered to the Crown, and the property subsequently became the property of the Earls of Cardigan. In 1888 the estate came to the hammer, and was nominally purchased by Colonel Wilson, of Leeds. Colonel J. T. North, who is a Leeds man, at once signified his determination to secure the ruins for his fellow-citizens, and the outcome of subsequent negotations was that the Abbey became the property of Colonel North for £10,000. In 1889 the estate was formally handed over to the Corporation of Leeds by Colonel North, who was presented with the freedom of the city. At this time the ruins were a dark and ivy-covered mass, picturesque, but rapidly crumbling to dust. Scarcely a strong wind blew but it carried away some piece of masonry, and it became absolutely necessary for the Corporation, in order to preserve the ruins, as well as in the interests of the safety of the public, to support the tottering walls. In 1890 the aid of Mr. J. T. Micklethwaite, F.S.A., of Westminster, was called in, and the work of repair and investigation began. The first step decided upon was the removal of the ivy, a proceeding which has given rise to a certain amount of adverse comment, and this work revealed a state of decay far more advanced than was supposed. The tower was in a very unstable condition, and a large buttress has had to be erected in the transept to support it. The end wall of the chapter-house had also to be rebuilt. In the Abbey grounds great improvements have been effected. About 5ft. of earth has been excavated all round the abbey, exposing to view the mouldings round its base. The earth thus excavated has been used for the making of an embankment along the river-side, which has been planted with willow. A 36ft. carriage drive has been made round the abbey, and numerous gravel-covered footpaths are now in the process of construction. Here and there are flower beds, which as yet are not planted. In laying out and extending the grounds about £5,000 has been expended, whilst the work of preserving the ruins has cost between £7,000 and £8,000. The formal reopening of the Abbey, after the work of renovation, took place on Saturday.

WHY THE MORECAMBE LANDING-STAGE FELL.

SOME remarkable evidence was given on Thursday in last week at the adjourned inquiry into the deaths of the three persons who lost their lives in the pier disaster at Morecambe. Emilus Hill, the manager, said the pier was surveyed in December last, at his request, by Mr. Thomas P. Worthington, of Blackpool, who sent his report to the directors; but it was not acted upon in any way by the board. The directors then had their doubts as to the condition of the pier; but, notwithstanding this, persons were permitted to use the landing-stage, which was considered quite safe. Thomas Parkinson Worthington, architect and engineer, said he examined the pier in November last, in accordance with instructions from the last witness, and sent a written report and detailed plans on the 14th February of this year. He recommended various repairs, improvements, and alterations, including a new system of bracing, fresh landings, and the substitution of sound bolts for those corroded, but was not consulted about going on with the work. He had examined the pier that morning. The bolts at the end of the middle carrying-girders were corroded, and had lost so much strength as not to be equal to carrying the weight of the girders, the grates, and the people upon them. It was not safe at all. The general cause of this weakness and wearing of the bolts was the great oscillation of the pier, which he did not regard as stable. The pier itself was strong, but wanted bracing. He estimated the proportion of the weight upon the girder to be about 5¼ tons, with which weight it was bound to collapse. Witness was handed a bolt, which he said would at first weigh about 4lb.; but it now only weighed about 1½lb., as it had been reduced by corrosion. The fixings of the landing-stage above the one which gave way were nearly as bad. A "dog" had been used instead of a bolt, and in some places there were only four bolts instead of eight. There were several places where the bolts had dropped out, and hundreds wanted renewing. By the Coroner: Bolts less than an inch in size should be examined every six, eight, or ten years. Seeing that the pier had been erected twenty-six years, every bolt should have been examined two or three times. The structure had gone far too long without examination. Mr. Hill (recalled) said the landing-stage was added in 1872. Witness (continuing) said when the weather was rough the pier-head was insecure, and not safe for people to go upon. The gratings might fall, and in doing so might strike against the cast-iron columns, which would at once break. The state of the fixings, added to the natural decay of the bolts and attachments, was the cause of the disaster. There was nothing whatever to show that the pier had originally been a railway bridge; but he saw sufficient to show that it was not strong enough for a proper railway bridge. He noticed that the girder was simply held by bolts, and was not socketed in a beam; that would materially weaken its carrying power. In his report, witness condemned the fixings and attachments, and advocated a new system of bracing and the erection of new landing-stages altogether. He had contemplated that the Pier Company would go on with the work at once, and had not expected that a fresh season would be allowed to pass without the structure being strengthened.—The Coroner read extracts from Mr. Worthington's report to the directors, in which he detailed the repairs required, and estimated the cost at £5,561 7s. 6d.—John Edward Gill, chief draughtsman for Messrs. Butler and Co., ironfounders, said he had examined the landing-stage, and had come to the conclusion that the cause of the collapse was the corrosion of the bolts produced. He had pointed out to the manager that some of the pillars were 12in. out of the vertical. He thought the method of construction was not a proper one.—The inquest was adjourned until Wednesday in next week, September 25th, when an official report will be presented to the Coroner by Lieut.-Col. Addison, R.E., who examined the structure on Monday on behalf of the Board of Trade.

THE A.A. BROWN BOOK.

IN anticipation of the forthcoming session of the Architectural Association, to be inaugurated on Friday, October 11th, by the presidential address of Mr. W. D. Caröe, the familiar "Brown Book," embracing a calendar, roll of membership, time tables of the studio and classes, and list of officers and meetings, has just been published by the A.A. Committee. The volume steadily increases in bulk, and now numbers 198 pages against 194 last year. A new and excellent feature is a tabulated list of the past presidents, hon. secretaries, and hon. treasurers of the Association. The first president, Professor Robert Kerr, who served in 1847-8, is still living, as are also two other well-known members of the profession who occupied the chair more than forty years ago, Mr. James Edmeston (1853-4) and Mr. Thomas M. Rickman (1854-5); Messrs. James K. Collings and John P. Seddon, the honorary secretaries of 1850-1, and their successors, Messrs. H. J. Braithwaite and Arthur Billing (1852-3), and Mr. Arthur Cates (1853-5), happily likewise are still with us, together with Mr. T. W. Goodman, joint secretary and treasurer forty years since—proofs of the youthfulness of the early officers of the body.

In their annual report, the committee state that 50 new members were elected and 7 were reinstated; the losses by death and resignation, however, amounted to 77, being a net decrease of 20. The total number of members is 1,111 (as compared with 1,131 in 1894, 1,129 in 1893, 1,125 in 1892, 1,138 in 1891, 1,129 in 1890, 1,094 in 1889, 1,052 in 1888, 993 in 1887, and 972 in 1886). A special sub-committee has been formed to take active steps to inquire into the working of the classes, and to suggest means to secure a larger attendance of students. The committee express regret that the courses of lectures on Professional Practice, Geology, Colour Decoration, and Heating and Ventilation were not held, owing to an insufficient number of students in these subjects. In accordance with what has now become an established custom, the lecturers and instructors met at the close of the session to discuss any alterations or suggestions which they thought it desirable to make with regard to the efficient working of the Educational Scheme. The question of premises has again received the earnest consideration of the committee, and the enlargement of the office and library will be completed by the opening of the new session. The attendance at the ordinary meetings has been well maintained, and larger than for many years past. Papers were read by Messrs. A. Beresford Pite, Keith D. Young, E. O. Sachs, C. G. Harper, John Slater, B.A., W. S. Weatherley, H. H. Statham, T. Stirling Lee, F. W. Pomeroy, J. W. Singer, E. C. Pinks, Henry Holloway, C. W. Whale, John Belcher, and Walter Crane. The library and register of assistants were well used. Summer visits were made during 1894 to the Houses of Parliament, Westminster Abbey, Oxford, Eton College, Kettering, Rushton Hall, and North Mymms Place and Church. The annual excursion was held in August, 1894, with the city of Wells as a centre. An increased attendance is reported at the spring visits, upwards of 100 members being frequently present. These were made to the Church House, Pavilion Music Hall, All Hallows, North St. Pancras; Brompton Oratory, St. Peter's, Ealing; the Building Trades Exhibition, and St. Olave's Grammar School. The common room which has been opened at 56, Great Marlborough-street, W., has been well patronised. The "A.A. Sketch Book" continues to prosper under the joint editorship of Messrs. W. G. B. Lewis and J. Begg, and its committee have received gratifying additions to the number of subscribers. A conference on the Technical Education of London Workmen was convened, and two meetings were held, at which there were present representatives of architects and builders, educational bodies, and trade unions. Sir Arthur W. Blomfield, A.R.A., was elected chairman, Mr. E. W. Mountford vice-chairman, and Mr. F. T. W. Goldsmith hon. sec. of the conference. The committee add: "The sittings of the conference have been temporarily suspended, owing to a difference of opinion having developed between the representatives of the trade unions and the National Free Labour Association." The annual balance sheet shows a total outlay of £1,671 18s. 6d., and an excess of expenditure over income of £247 15s. 9d., the balance carried forward being £612 7s. 2d.

OBITUARY.

The death is announced of Mr. Thomas Nicholson, F.R.I.B.A., of Hereford, the well-known ecclesiastical architect and surveyor, at the advanced age of 72 years. Mr. Nicholson was apprenticed to an architect in Portsmouth, but commenced practice on his own account in Hereford 50 years ago, when only 22. He was widely known for his church work, and had been diocesan surveyor and architect for Hereford since 1871. His works include one new church and three enlargements of churches in Hereford, the new churches of St. Michael, St. James, St. Thomas, and St. Helen, Swansea; and others at Aberystwith, Penrhiwceiber, Pembroke Dock, and Sauntry, near Dublin; the markets and public buildings at Presteign; a corn exchange, market, and reading-room at Ross; farmers' club, assembly rooms, hotel, and police-station at Knighton; and numerous schools and parsonages. He also restored Brockhampton Court at an outlay of £20,000, the Episcopal Palace at Hereford, and Goodrich Court. He had been a Fellow of the Royal Institute of British Architects since 1861. He is survived by his second wife and by three sons.

Mr. Henry G. Harrison, an architect once of considerable distinction in New York, died a short time ago at the age of eighty-two. Although, says the *American Architect*, he designed a considerable number of important buildings in New York, including the Woman's Hospital and the Manhattan Market, which was, at the time of its erection, one of the wonders of the town, he became particularly prominent through his connection with the magnificent schemes which the late A. T. Stewart attempted to carry out at Garden City, Long Island. Mr. Stewart had an idea that a great rural city, so to speak, could be established around a nucleus of fine public buildings, and he intrusted Mr. Harrison with the designing of the buildings. Of these, the principal was to be a cathedral, and the cathedral was really built and dedicated, but, of the other intended structures for public use, none was carried out, except certain school buildings. The cathedral, however, was, and still remains, a fine and costly structure, which will perpetuate, as it was intended to do, the memory of its founder, and also that of its architect.

CHIPS.

Earl Rosebery will visit Scarborough on Friday, October 18th, to open the new Liberal club-house, erected at a cost of over £15,000.

The ceremony of laying the foundation-stone of the new St. John's Roman Catholic Church at Bridgnorth took place on Thursday in last week. Dr. Carroll, Bishop of Shrewsbury, officiated.

A new private school at Bodmin, known as Hartleigh House, was opened on Tuesday. It has been built from plans by Mr. W. J. P. Jenkins, the contractors being Messrs. Grose and Brown and Son, all of Bodmin.

The monthly report of the Labour Department states that: "The building trades continue well employed, and the percentage of unemployed members of unions making returns has fallen from 2·4 in July to 1·8 in August, compared with 3·4 in August, 1894. The furnishing and wood-working trades have improved to some extent, the percentage of unemployed union members having fallen from 3·0 in July to 2·7 in August, compared with 4·8 in August, 1894."

The town council of Morpeth have, under notice from the Northumberland County Council, instructed Mr. D. Balfour, of Newcastle-on-Tyne, to prepare report, plans, and estimate for complete sewage disposal works for the town, so as to prevent the pollution of the river Wansbeck, to meet the requirements of the Local Government Board, and to secure its sanction for a 30 years' loan.

Old King-street Baptist chapel, Bristol, was reopened on Sunday, after extensive alterations, carried out from designs by Mr. H. J. Jones, M.S.A., Bridge-street, Bristol. The works include the removal of the organ from the front of the building to a specially constructed chamber behind the pulpit, the remodelling of the instrument (carried out by Messrs. Voules and Sons), and supply of a new case, redecoration, the reconstruction of the glazing and ventilation, and the addition of classrooms and vestries at the rear of the chapel. The entire outlay has been £2,500, and Mr. G. H. Wilkins, Thomas-street, Bristol, was the contractor.

The new business house erected on the Embankment for Mr. J. J. Astor is approaching completion. It is Free Renaissance in style, and is faced with Bath stone, the internal fittings being of oak. Mr. J. L. Pearson, R.A., is the architect, and Mr. John Thompson, of Peterborough, the builder.

At the monthly meeting of the Morecambe District Council, it was resolved to apply to the Local Government Board for sanction to borrow money for the erection of a new promenade bay and conveniences thereon at the West End, between the new pier in course of construction and the Battery Inn; and that the Marine-road be widened 15ft. and the promenade 9ft. between those two points, both additions to be taken from the existing green.

The church of St. Thomas, at Northaw, Herts, has recently received further interior decorations. On the east wall of the north transept over the vestry door has been placed a fresco painting of our Lord giving His last charge to His disciples. The transept walls have the sacred monogram, and that of St. Thomas of Canterbury, surmounted by a mitre, placed alternately on a grey ground. On the north and south walls of the nave a dark red dado has been added. Over this, up to the level of the top of the windows, there is a conventional pattern of pomegranates. On the walls of the north and south transepts a conventional border has been carried round the arches, and the spaces above covered with grape vines, while the arches and caps have been picked out with gold. The decorations have been executed by Messrs. Heaton, Butler, and Bayne, of Garrick-street, London. There has been added a third stained-glass window on the north side of the nave, of the same style and character as those placed there in the early part of the year, and also executed by Messrs. Heaton, Butler, and Bayne. The subject is the Parable of the Talents.

Engineering Notes.

Liverpool and Leeds Canal.—About five years ago the directors of the Canal Company submitted a proposition to expend over £500,000 in extending the reservoir accommodation, in building retaining walls, in deepening and widening the bed of the canal, and increasing the warehouse accommodation and working plant. The scheme obtained the consent of the shareholders, and in 1891 Parliamentary powers were obtained to raise £400,000 of debentures and £275,000 of additional capital. Soon afterwards the works were commenced, under the direction of the engineer, Mr. R. H. White, and at present the company has expended £150,000 on extending the reservoir accommodation, which now amounts to 1,200 millions of gallons, about £110,000 on improvement works, £43,000 on warehouses and other buildings, and £13,000 on working plant. Already the retaining walls have been carried nearly the whole length from Liverpool to Burscough Bridge, a distance of 24 miles, on the towpath side, and for a considerable distance also on the other side of the canal. The formal inspection of this section took place on Saturday. Dredging operations have also been in progress in the Halsall and Lydiate district for 11 miles, the result being that the sectional water surface has been increased from 149 to 220sq.ft., or an increase of about 50 per cent. The work is now proceeding at the rate of about 10 miles per annum. The full effect of the improvements will be that whereas two barges going in contrary directions could only just pass each other, there will now be plenty of space for three; the training walls doing away with the inevitable shallowness of the canal towards each of its banks. The dredging apparatus has been specially designed by Messrs. Cockburn and Montgomery, of London, for continuous working without interference with the traffic. In connection with it is an apparatus for depositing the dredged material at any required distance at the rate of a ton per minute. The directors propose to overhaul and improve the whole of the 127 miles of their canal, and some improvements are already in progress in part of the Yorkshire section.

The New Lynton and Barnstaple Railway.—The first sod of the new Lynton and Barnstaple Railway was cut on Tuesday at Shamblehay, near Lynbridge, by Lady Newnes. The new railway will be of 2ft. gauge, and will start from the North Walk, Barnstaple, where a joint station with the London and South-Western Railway will be built. A quay will also be constructed at Barnstaple, at which shipping traffic will be transferred direct into the company's trucks. The line will follow the Valley of the Yeo, and the terminus is on the hill above Lynbridge and about a mile from Lynton. Considering the hilly nature of the country, the gradients are very easy, being in no case steeper than 1 in 50, but such gradients prevail for 60 per cent. of the line. The total length will be 19¼ miles. There will be five stations between Barnstaple and Lynton—namely, at Chelfham-bridge, Bratton, Blackmore-gate, Parracombe, and Martinhoe-cross. The cost of construction is estimated not to exceed £50,000, or £2,500 a mile, and it is expected that the line, which will contain no tunnels and no works o great magnitude, being almost altogether a surface line, will be ready for traffic by the summer of 1897. Sir James Szlumper, of Westminster, has acted as consulting engineer, and Mr. G. Smyth Richards, of Barnstaple, as surveyor and valuer.

The relics of Lord Nelson exhibited to the public in the Painted Hall of Greenwich Hospital, to which important additions were recently made, have been further augmented, also from Viscount Bridport's collection, by the presentation to the nation of a silver jug and cover on a tripod stand with lamp, formerly the property of Lord Nelson, and an oak box, silver mounted, in which the document was contained attesting that the freedom of the borough of Thetford was conferred on the Admiral in 1798.

The engines for the Snowdon Railway are not built by Messrs. Rinecker, Abt, and Co., as has been previously stated, but by the Swiss Locomotive Works Company, of Winterthur. The double bars forming the Abt rack rail are of rolled steel, the teeth being cut out of the solid bars by means of special machinery. The rack permanent way material is manufactured by Messrs. Cammell and Co., Ltd., of Sheffield, under the supervision of Messrs. Rinecker, Abt, and Co., the proprietors of the Abt system.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—F. J. Holman.—C. W.—Inquirer.—C. M. W. —J. S. and Co.—F. G. (Batley).—E. Benson.

Correspondence.

HOW THEY DO IT IN THE WEST INDIES.

To the Editor of the Building News.

Sir,—The architectural all-round genius is not altogether unknown in the United Kingdom, but your readers may be interested to find that he also flourishes in our colonial possessions.

As an English architect now residing in the West Indies, I was astonished to come across the following gem among other advertisements relating to teas, fancy goods, &c., at the back of a book having a fair circulation in these islands, entitled "About Barbados." The professional at home is not in it with this suave child of the Tropics, whose announcement is appended in all its native purity :—

> JAMES MURPHY, engineer, architect, builder general contractor, painter, paper hanger, and house decorator. All materials guaranteed genuine. Workmanship of first quality. Plans, specifications, and estimates furnished on the shortest notice. All work intrusted to the above will be carried out with the utmost despatch, combined with good workmanship. Charges moderate and terms liberal. A staff of good workmen always at hand for general jobbing. Iron verandahs, rails, gates, crestings, finials, marble slabs, tomb rails, and parquet floors imported, or made from native woods. "Verona," Bank Hall-road, Barbados. Telephone No. 135.

And yet some individuals declare the public do not need protection, and that there is no necessity for registration and the compulsory examination of architects.—I am, &c.,

St. Lucia, Sept. 6. J. T. R.

* * *

The county council of Devonshire have appointed a committee to consider and report whether steps should be taken to acquire the Forest of Dartmoor so as to protect it from being used in any manner injurious to the general interests of the county.

Intercommunication.

QUESTIONS.

[11424.] — **Sub-Contracts.** — What are the usual conditions of payment to be made to a sub-contractor by the head contractor for the erection of a building, where no arrangements had been made relative thereto? Is the sub-contractor entitled to the same percentage of value of the work done by him as the head contractor, and at the same time? When the former has finished his sub-contract, is it customary to have to wait for the balance until the latter receives his final payment, or is it due by custom when his work is completed?—G. H.

[11425.]—**Moment of Inertia.**—I shall be obliged for a solution of the following question. What is the moment of inertia of a rectangular beam of uniform section, its depth being d, and its breadth b in inches? Give the expression for the moment of resistance at any section of the same beam, when the extreme stress of the fibres is S tons on the inch.—X.

[11426.]—**Met. Act.—Public Buildings.**—Can anyone inform me if there is any treatise, pamphlet, or code relating to the construction of schools in the City, which gives, at least, a general idea of what is expected by a district surveyor?—J. D.

[11427.]—**Concrete Floor.**—I have some warehouse fireproof flooring to lay, of an average span of 9ft. I propose to lay 2in. by 2in. T-irons, 12in. apart, and fill in with 4in. of concrete. Can any of your readers inform me whether this would be strong enough for the purpose? —No Confidence.

[11428.]—**Circular Houses.**—Standing at either end of the Cornish village of Burryan are two stone-built circular houses with thatched roofs, surmounted in each case, if I remember rightly, by a tall wooden cross. There are five or six of these curious old dwellings in the valley, but during my stay I was unable to obtain any particulars as to their origin and history. The guide-book does not name them, though they are so curious, and I should be much interested if some fellow-reader could supply the information.—Layman.

[11429.]—**Waterworks.**—Will some reader kindly give the names of one or two of the best books on the construction of waterworks for town supplies, especially treating on the construction of reservoirs, laying pipes, arrangement of intakes, fireplugs, valves, &c.?—Aqua.

[11430.]—**Estates.**—In laying out estates (to be leased to builders), preparing plans, supervising, &c., what are the usual fees to charge client and builder?—Stumping.

REPLIES.

[11412.] — **Varnished Wood Ceiling.** — As "G. B. D." states that the ceiling has been repeatedly varnished, it is probable that the stain has not reached the wood. If so, thoroughly scour with stale beer, and immediately after wash with soft water and a little soap, just sufficient to give a slight lather. Wash again with soft water, and rub dry with a chamois leather. This would restore the colour, and the wood could be varnished, as it was in the original instance. If, however, the woodwork is stained, it would be best to give it a coat or two of paint, and then varnish.—A. S.

[11417.]—**Models.**—I think "J. G. O." will find the information he requires in "Architectural Modelling," by Richardson, No. 127 of Weale's series, published by Crosby Lockwood and Son.—A. S.

[11417.] — **Models.** — "J. G. O." should obtain "Richardson's Architectural Modelling in Paper," published at 1s. 6d. by Crosby Lockwood and Son, a very useful little treatise on the subject.—H. Busbridge.

[11417.]—**Models.**—"J. G. O." cannot do better than get a little treatise on "Architectural Modelling," by Richardson, published by Lockwood, Stationers' Hall-court, E.C.—G.

[11418.]—**Cool Roof.**—The best plan of keeping a slate roof cool in summer is to board and felt the roof. The felt can be fixed below the rafters if the roof is already constructed. If this cannot easily be done, I should recommend "W. J. J." to line the ceilings of attics with slag wool, as I presume the object sought is to render the rooms under the roof cool.—G. H. G.

[11418.]—**Cool Roof.**—"W. J. J." should line his roof with Jones and Co.'s silicate cotton, about ½in. to 1in. thick, placed between the rafters. This will exclude cold as well as heat. I believe the makers can supply this material in sheets, if desired.—M. Hurdis.

[11421.]—**Girder Calculations.**—"Sigma" will fine all the information he requires in "Strains on Structures," by Middleton, published by Batsford, 52, High Holborn; and "Strains in Ironwork," by Henry Adams, published by Spon, 125, Strand. He will also find Harrison's Clinograph, made by Harling, 47, Finsbury-pavement, E.C., of great service in setting-out diagrams of graphic statics.—A. S.

[11421.]—**Girder Calculations.**—There are many graphic methods of solving problems arising in the design of girders, and in many cases these are far preferable to calculations for practical purposes. The principles of the subject are very clearly explained in the excellent little work by Gray and Lowson on "Graphic Statics" (published by Collins at 3s. 6d.); but "Sigma" would do well to take some regular course of lessons on graphic statics if he wishes to master the subject. The slide-rule is also of great assistance in abbreviating the tedious arithmetical calculations required in designing girders.—H. Busbridge.

[11421.]—**Girder Calculations.**—Timmin's "Girder Calculator" is a very ingenious and useful method for calculating strength, also of giving rules as to riveting. The instrument was lately noticed in the Building News. —G. H. G.

[11422.]—**Eastbourne.**—Several old and interesting typical churches may be seen in this neighbourhood. One of the chief is the fine old parish church of St. Mary the Virgin, in the Old Town, about a mile and a half from the sea. It is of general 15th-century design, though there are some very interesting Norman or Transitional Early English arches in the long chancel. There is a noble nave with massive timber roof, and a grand tower the whole width of nave, with very boldly projecting angle buttresses on the west side. There are eight bells. Several fine painted windows are to be seen. Willingdon, three miles to the north of Eastbourne, has an interesting old church of flint and Eastbourne rock, dating from the 13th century. It is plain externally, having a tower with low shingle broach spire of the Sussex type. Internally the principal features are the ancient timber roof (open) of rough-hewn tie-beams and centre-posts carrying curved struts. The arcade is of plain 16th-century character. The old wooden screens in north aisle and chancel are of very rich Decorated tracery, well worth study, and there are some fine Elizabethan monuments in the north aisle, and a few interesting painted-glass windows. Wilmington, seven miles north-west, has a very interesting church. Hailsham, seven miles, has a fine old church of Transitional Early English character, having an embattled tower of later date. At Eastdean, Folkington, Heathfield, Hellingly, Jevington, Sullington, all places within easy reach, there are churches of interest. The latter is said to be the smallest in England, 16ft. square, the chancel of a much larger church. Of modern buildings of this class the most noteworthy is the late Mr. Street's spacious church of St. Saviour at Eastbourne in red brick and stone, which has a wide nave.—G. H. G.

CHIPS.

The Bishop of Truro hopes to build a mission chapel as soon as possible on Par-green, not far from his residence, where a suitable site has been given by Mr. Bassett. Mr. E. Sedding, of Plymouth, is to design the building.

The memorial-stone of new Roman Catholic schools, in connection with St. Robert's Church, Harrogate, was laid on Tuesday. The schools are to be erected from designs by Mr. E. Goldie, architect, of Kensington, and are to cost upwards of £3,000. They are to be built of red brick with stone dressings, to match the church, and are to accommodate 318 children.

The restoration of the Black Prince's Chantry of Canterbury Cathedral, in which the descendants of the French Huguenots living in the city are in future to worship, has revealed the remarkable delicacy of the sculptured bosses which were such an interesting feature of the architecture of the period to which the chantry belongs. The restoration will soon be complete.

The Speaker of the House of Commons opened on Wednesday week a garden *fête*, held in behalf of the fund for the improvement of Upperby Church. The church was built in 1840, and plans were made a few months ago by Mr. Ferguson, of Carlisle, for extension and improvement, and a portion of this is now being carried out. Of the £700 wanted, about £560 has already been subscribed.

The corporation of Rochester, who have the custody of the Norman castle in that city, have recently repaired the north-western turret of the keep with fresh masonry, and now propose to similarly renovate that at the south-western angle.

The bells of St. Michael's Church, Coventry, which ten years ago were taken out of the belfry during the restoration of the spire, are this week being replaced. The bells are not to be rung, for fear of damaging the fabric, but will be chimed. The peal contains ten bells, incorporating the original metal of the six bells known to have been in the tower as early as 1429. The original six bells were recast in 1674 into eight bells; these were recast in 1774, and two more bells added, making the present peal. The bells will be first chimed on Sunday week, St. Michael's Day.

The new tramway between Perth and Scone, extending to over three miles, was formally opened on Tuesday.

The peal of bells at North Petherton, which has been recast by Messrs. Mears and Stainbank, was dedicated on Tuesday.

Designs for an infectious diseases hospital at Paignton have been prepared by Mr. J. Stansfield-Brun, C.E., F.R.I.B.A., surveyor to the urban district council, and submitted to the Local Government Board, who have requested the council to send a deputation, with its surveyor and medical officer of health, to London to confer with the Government officials on the subject.

A new public hall is being erected at Devons-road, Bromley, and special consideration has been given to the ventilation, which will be effected on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Owing to the estimated cost of the new grammar school for Paisley exceeding by over £10,000 the bequest of £15,000 by the late Mr. Barbour, M.P., the Burgh School Board have considered the question of a modified scheme. A motion was submitted to the effect that a revised version of the accepted plan be prepared showing a school for 600 pupils, to cost £16,000, exclusive of site; and it was carried, against an amendment to modify the present plans to save £3,000.

Legal.

WHAT IS A NEW BUILDING?

THE London Building Act 1894, section 5 (6) defines a "new building" as "any building which has been taken down for more than one-half of its cubical extent and re-erected, or commenced to be re-erected wholly or partially on the same site after the commencement of the Act." To such new buildings the more stringent regulations of the Statute of 1894 would apply. In the recent case of "Crow v. Redhouse" (*Times*, 31 July), the meaning of this clause had to be considered. The facts were, that there had been a fire at 3, Church-street, Whitechapel, in consequence of which the structure had been taken down almost entirely, some two-thirds of the old party-wall, with the adjoining house, only remaining. The district surveyor having been served with a notice from the owner that he was about to rebuild this place as a six-storied warehouse, objected that the old party-wall was not thick enough, according to the new regulations. He, in short, contended that this was a new building altogether, and so that the wall must be strengthened.

On the other hand, the owner argued that his case came within section 208 of the Act of 1894, which deals with fires and walls, and expressly provides that "where a party-wall or an external wall not in conformity with this Act has been taken down, burnt, or destroyed to the extent of one-half thereof (measured in superficial feet), every remaining portion of the old wall not in conformity with this Act shall be taken down before the rebuilding thereof." The magistrate supported the view taken by the owner, and held that he could not be compelled to take down, rebuild, or thicken his old party-wall, because as only one-third of it had been removed in consequence of the fire, it did not come within section 208. In the Divisional Court the two judges were divided in opinion; but now in the Court of Appeal the Master of the Rolls and Lords Justices Kay and A. L. Smith have confirmed the decision of the magistrate. They did so on the ground that they could not find any section in the Act of 1894 which enabled the surveyor to deal with this wall, and that the clause defining a "new building" was not an enacting clause, and so could not cover this case of a wall by including it in the building more than half of which had been removed. So this very fine point was decided in favour of the owner and against the district surveyor.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

SIGMA.—BRIDGE.—PARISH.—REBUILDING.—This may probably have to be done at the expense of the county if it is part of the highway. It would be better to consult the county council of the district, or write to the Local Government Board.

◆

The effort to build a memorial Congregational Church at Gainsborough to John Robinson, the Pilgrim Father preacher, is making progress. American Congregationalists have given the project support, and £3,309 has been raised towards the building fund, the outlay being estimated at £6,000. In the spring of next year the Hon. T. F. Bayard, the American Ambassador, will lay the corner stone of the memorial church.

Mr. Leeson, the architect for the restoration of the steeple and lantern of St. Nicholas' Cathedral, Newcastle, reported to the Newcastle Finance Committee, on Friday, that scaffolding was now erected up to the spire of the cathedral, and he asked for instructions to proceed with the proposed repairs. It was unanimously agreed that the work be intrusted to Mr. Walter Scott, contractor, of Newcastle, and that it should be begun forthwith.

On the invitation of the River Wear Commissioners, the ceremony of laying one of the large blocks in connection with the new south protecting piers was performed on Thursday, the 12th inst., by Rear-Admiral Arthur H. Alington. Mr. James Laing, the chairman of the commission, explained that, when finished, the new north pier and the new south protecting pier will be about 500 yards apart at their extremities. The north pier will overlap the south, so that during northern gales the south end will be protected from the sea. The works are being carried out from plans prepared by, and under the supervision of, Mr. H. H. Wake, the commissioners' engineer.

LEGAL INTELLIGENCE.

BUILDER AND CLIENT IN CONFLICT.—At the Poole Police-court, on Sept. 12, Henry Nelson Jenkins, builder and town councillor, of Bournemouth, was summoned by Lieut.-Col. Charles Mercier, of Canford Cliffs, for assaulting and beating him on Aug. 31. There was also a cross-summons, in which Col. Mercier, Gertrude Mercier, and George Lambert Clear were charged by Henry Nelson Jenkins with having, on the same date, unlawfully assaulted him. The colonel's case was that in August, 1894, he invited tenders for the construction of a marine residence at Canford Cliffs. Messrs. Jenkins and Son, of which firm defendant was one of the partners, entered into a contract to build the house for the sum of between £4,000 and £5,000. From the first the relations between the complainant, the architect, and the builders were unhappy, and the matters were referred to arbitration. On Aug. 28, Mr. Fogerty, the architect, caused a notice to be delivered to Messrs. Jenkins and Sons to the effect that unless his instructions were carried out in all matters, clause 14 of the contract would be enforced, the contract determined, and the premises taken possession of. On August 31 Colonel Mercier took possession of the premises, and during a struggle defendant was alleged to have struck him in the face. John Frederick Fogerty, of St. Peter's-terrace, Bournemouth, the architect, and Messrs. Jenkins and Sons, on the other part, deposed that on August 30 he visited the works and found the workmen covering over some joists which he had directed the contractor to remove. He essayed to get the joists removed, but this was prevented forcibly by the workmen. On August 31 he again visited the premises with policemen and ejected the contractors' workmen. For the defence it was urged that Jenkins only struck back after the colonel had punched him in an endeavour to push him over the gate. Evidence having been given for the defence by Mr. Tom Stevens, architect, of Bournemouth, and by Benjamin Painter, a foreman in the employ of the defendant, the Bench retired. The Bench considered the offence proved, but that it was committed under great provocation, and a fine of 20s. was imposed. The cross-summons was then withdrawn by leave.

AN ACQUITTAL.—Samuel Page, a ganger, Charles Smith, James Sindle, John Rottenbury, Edwin George Rottenbury, described as carmen, and Edmund Rottenbury, forty-eight, contractor, were indicted at the London County Sessions on Saturday for stealing a quantity of gravel, valued at 30s., the property of the Camberwell Vestry. The gravel was taken from Alleyne Park, and was afterwards discovered in Rottenbury's yard. For the defence, it was contended that the prisoners thought they had authority from a man named Sawyer to remove the sand, but they misunderstood his instructions. The jury found the prisoners not guilty, and they were thereupon discharged.

MORTAR AND "MORTAR."—Mr. A. Geard, builder, of Archway-road, answered, on Tuesday, to an adjourned summons, taken out by Mr. Wm. Smallpeice, district surveyor for East Hampstead, for, in the erection of two houses at 108 and 110, Fleet-road, Hampstead, using mortar not made in accordance with the by-laws of the London County Council. The evidence for the prosecution was that the mortar used by the defendant was found by the council's analyst to be deficient in lime. For the defence it was contended that the article used contained properties which rendered it perfectly sound. Mr. Plowden said the only question was, whether the defendant had complied with the regulations. The mortar used might be excellent, but it was not the mortar which the County Council required to be used, and this had been clearly proved. He imposed a fine of 40s., and granted £2 2s. costs.

◆

The new infectious hospital, Burton-on-Trent, is being warmed and ventilated throughout by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues and Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

There has just been erected by public subscription in the interior of New Porthill School, Gallowgate, Aberdeen, a mural tablet of Gothic design, to commemorate the late Dr. Reith's services in that poor and populous district. The memorial is in grey and red granites, and was designed and executed by Mr. Arthur Taylor, sculptor, Aberdeen.

Major General Carey, R.E., Local Government Board inspector, attended at the Town-hall, Dudley, on Friday, to inquire into the application of the Town Council for sanction to borrow £2,510 for street improvement purposes. The loan asked for was to complete the schedule of streets prepared in 1887. The following loans had been obtained for the same purpose:—£1,500 in 1888, £1,500 in 1889, £1,500 in 1891, £1,850 in 1893, and £530 in the present year. The borough surveyor said there were 26 streets to be paved.

STATUES, MEMORIALS, &c.

CARLISLE.—The memorial of the late Dr. Harvey Goodwin, Bishop of Carlisle, erected by subscription, was unveiled on Tuesday in Carlisle Cathedral by the Archbishop of York. The memorial consists of a bronze recumbent statue by Mr. Hamo Thornycroft, R.A., exhibited in this year's Royal Academy, surmounted by a carved oak canopy, designed by Mr. Alfred Waterhouse, R.A. The figure of the late bishop is shown reclining at full length, dressed in episcopal robes, his head resting upon a pillow, round which cherubs are grouped, and with his feet planted against a rock, near to which stands his mitre. The hands are joined together upon the breast in the conventional attitude. The following appears on the central panel at the back of the canopy:—"In memory of Harvey Goodwin, fifty-eighth Bishop of Carlisle; at Cambridge, at Ely, and in this diocese, a proved leader of men; learned, eloquent, wise, untiring, he used his rare gifts of mind and heart in the service of his Master for the good of the English people, and of the Church of Christ at home and abroad. Born October 9, 1818; consecrated November 30, 1869; died November 25, 1891." The memorial stands in a bay in the south aisle of the cathedral, adjoining a marble recumbent effigy of the late Dean Close.

◆

CHIPS.

The School Board for West Hartlepool have adopted plans by Mr. E. Percy Hinde, of Liverpool, for the Brougham school. The building will accommodate 1,375 children, and the caretaker's house will be built on a portion of the site, which has frontages to Brougham-terrace and Wharton-terrace, West Hartlepool.

The Congregational Church at Pokesdown, near Bournemouth, was reopened on Wednesday week, after renovation and enlargement. The accommodation has been increased from 200 to 440 sittings. Messrs. Lawson and Donkin, of Bournemouth, were the architects, and the builder was Mr. F. Elcock.

Special services were held at the church of St. Lawrence, Lawrence Hill, Bristol, on Sunday, in celebration of the tenth anniversary of consecration, and at the same time the opening of a new organ. The instrument is a two-manual organ, and has been built by Mr. W. G. Vowles, of Bristol, at a cost of between £200 and £300.

The Great Western Railway Company are making arrangements for materially accelerating the passenger service between Paddington and the West of England and South Wales by picking up water as the trains proceed, on the system long since adopted by the North-Western Railway Company. For this purpose tanks are being fixed which will be supplied from a deep well near the river Thames at the Grotto Bridge, between Pangbourne and Goring Stations. These tanks will supply troughs which are being sunk on both the up and down lines, and from which the engines will pick up their water while running. The works between Pangbourne and Goring, upon which a large number of men are employed, are in a forward state.

On the new line of the Great Northern Company, in Nottinghamshire, the bridges are to be of stone with steel girder tops. This is with a view of enabling these bridges to be lifted should the ground give way through being hollowed out underneath by coal workers. This new line, by the way, although only some six miles long, is expected to cost between £30,000 and £40,000 per mile.

The members of the Scottish Plumbers' Congress and their friends, to the number of about a hundred in all, had an excursion from Dumfries on Friday to Wanlockhead and Leadhills, in order to visit the lead mines. Proceeding to Thornhill by rail, they had thence a circular drive which took in the Mennock, Elvan, and Dalveen passes. The conference was resumed in Dumfries in the evening, when the chief topic of discussion was, "Should soil and waste pipes be placed outside or inside the walls of a building?" It was resolved to hold next year's congress at Edinburgh.

The Manchester board of guardians decided on Friday to proceed with the erection of additional rooms for nurses at an estimated cost of £4,430.

The employment of electricity for street lighting at Folkestone has again been deferred by the corporation of that borough, after a long discussion as to the relative merits of the schemes formulated by Mr. Parker and Mr. F. H. Smedhurst. The former would involve an anticipated expenditure of £35,000, and the latter was estimated to cost £13,000.

The day schools adjoining the Convent of the Cross in Parkwood-road, Pokesdown, are being enlarged, the enlargement being so extensive as to almost double the size of the schools. The work is being carried out by Mr. W. Hoare, of Bournemouth, who built the existing schools.

Our Office Table.

At the last meeting of the Sheffield Town Council a long and irregular debate took place on the cost of the new Town Hall, now in course of erection from Mr. E. W. Mountford's designs, arising out of a resolution of the Improvement Committee to accept tenders for fittings and furniture, amounting to a sum of over £17,000. Alderman Batty Langley, M.P., the chairman of the committee, read a general statement, showing as nearly as he could fix it the actual cost of the Town Hall when completed and in habitable condition. The contract for the building was £83,945, and with extras already sanctioned, together with the architect's commission and other similar items, it came up to £104,357. The fittings and furniture now brought up amounted to £17,721, and there would be further expenditure in the shape of electric light fittings, cooking apparatus, blinds, carpets, and the like, amounting to £8,550, which included £2,000 for possible contingencies. This brought up the expenditure to £130,628, and adding £49,000 as cost of site, the total expenditure came to £179,600. These figures startled councillors, some of whom declared that at the outset the figure of £80,000 was stipulated as the outside cost. It was stated in answer to questions that the architect would not be paid by commission on the cost of the fittings, but an agreed upon definite sum of £250, whether the outlay were great or small. One or two of the members still thought the proposed cost on too high a scale. Alderman Langley declared that if further delay took place, by referring the tenders back to the committee, it would be impossible to say when the Town Hall would be opened. As it was, he failed to see how the opening could take place before July or August next year. The amendment to send the tenders back was eventually defeated.

It would have been thought to be comparatively easy to settle definitely who was the architect of the Georgian-Renaissance screen of columns and entablature which forms so effective a mask to the Whitehall front of the old Admiralty Buildings; but a newspaper controversy has arisen as to whether this should be credited to Robert Adam or Thomas Papworth. A writer in the *Standard* of Thursday last casually referred to the screen as the work of "Adams." A day or two later "Grandson of Thomas Papworth" asserted that "Adams" was not responsible for it; but that it was designed and executed by John Papworth, adding that the designer's son (? the late Wyatt Papworth, F.R.I.B.A.) used to declare that the work was never paid for. A correction to this correction has been promptly proffered by Mr. Percy Fitzgerald, who states that the screen is by the Brothers Adam, pointing out that the design, which has been mutilated in late years, with a description, is given in the great Atlas folio of this work. Mr. Fitzgerald adds: "There was originally but one opening—that in the centre. Two others have since been broken to the right and left, thus destroying its significance as a screen. Adam—not Adams, as he is so often called—also designed various ornaments (statues and the like), which have never been supplied. When it was a real screen it was justly admired for its elegance. In its perforated state it is unmeaning and incoherent." The "grandson" has returned to the charge, stating that the son-in-law of Thomas Papworth, a solicitor named Van Sandau, applied to the Admiralty authorities for the remuneration due to Papworth, then deceased, but was refused; not on the ground that he was not the architect, but merely because a fresh Government had come into power.

An unusual change of relationship to a board of guardians—the descent from vice-chairman's seat to the sanitary inspectorship—is reported from Truro. At the last meeting of the poor-law guardians of that city, Mr. James Retallack, who has for nearly twelve years been a member of the board, and of late years the vice-chairman, resigned his seat, and was thereupon elected from among four candidates inspector of nuisances. The salary offered was £100 a-year.

The town council of Aberdeen discussed, on Monday, a proposal to lay tar macadam on a number of suburban roads and secondary streets of the city. The recommendations came from the streets and roads committee, a deputation from which recently visited various towns in England for the purpose of inquiring as to the suitability of the material for roadways. A deputation from the trades council was heard against the proposal, which was also severely criticised by several town councillors. The main objections to the proposal were that granite paving in the end would be much cheaper than tar macadam, and that the introduction of the new material would in all likelihood damage the trade in granite for paving setts and ordinary macadam, which was of considerable importance to Aberdeen. The recommendation to adopt tar macadam was defeated by fourteen votes to nine.

The waterproofing of brick and sandstone with oils formed the subject of a paper recently read before the Australian Association for the Advancement of Science by Professor Liversidge. Experiments were made with the view of ascertaining the length of time that brick and sandstone are rendered waterproof or protected by oil. The oils used were the three most readily obtainable for such purposes—viz., linseed oil, boiled linseed, and the crude mineral oil known as "blue oil," used for preserving timber. The weatherings were made upon a flat portion of the laboratory roof, fairly exposed to the sun and weather. Good, sound, machine-made bricks were experimented on. The amount of oil and water taken up by the sandstone was very much less than that absorbed by the brick, although the area of the sandstone cubes was much greater than that exposed by the bricks. Equal amounts of raw and boiled oils were absorbed; the blue oil, however, was taken up in much greater quantity by both brick and sandstone, but by the end of 12 months the whole of the 13¼oz. of blue oil had apparently evaporated away, and the brick had returned to its original weight. The bricks treated with raw and boiled oils remained unchanged. After the second oiling in November, 1890, and exposure for nearly four years and two months, they had practically retained all their oil, inasmuch as they had not lost weight, and were also nearly impervious to water. The sandstone cubes treated with raw and boiled oils returned to their original weights, but do not appear to have lost the beneficial effects of the oils, being also practically waterproof.

Messrs. Messenger and Co., the well-known horticultural builders and heating engineers, have this week removed their business operations to extensive new premises recently erected by them in connection with their foundry close to the station of the L. and N.W.Ry. at Loughborough. The new buildings occupy a site two acres in extent, and comprise spacious shops for joiners and fitters, erecting shop for horticultural buildings, show-room, timber sheds, offices, &c. The constant expansion of the firm's business for several years past has gradually outgrown the limited accommodation of the premises in which it was founded some thirty years ago, and the additional facilities derived from such commodious new buildings will no doubt give renewed impetus to the development of their old-established and high-class trade.

An electric-light installation will be provided for Ayr at the end of October, when it will largely supersede gas as an illuminant. Under Mr. Hammond and his assistant, Mr. E. G. Pink, who was last week appointed burgh electrical engineer, the work has been proceeding during the last twelve months. The generating works occupy a central station on the south bank of the river Ayr, about 100 yards below the railway bridge, which is within the tidal influence. Part of the buildings abut on the river, from which they are protected by a concrete wall, and access is had by Mill-street. The range of buildings are of the usual character, including power-house, boiler-house, and offices. The power is supplied by two boilers, 28ft. by 7ft., working a pressure of 125lb. when condensing and 140lb. when non-condensing, and capable of each supplying 200H.P. The system upon which the installation is based is the high-tension alternating. To generate the current there are four sets of engines in the power-house. The two principal engines each drives a 100 kilowatt alternator, by Siemens and Co., Woolwich. The principal machines are capable of supplying light to the amount of 6,600 eight-candle lamps, and a 50H.P. machine 850 eight-candle lamps. The total amount of light, measured in candle-power, is thus nearly 70,000 candles. The plant may yet be used to work a tramway between Burns Monument and Prestwick through Ayr, a distance of about six miles.

According to the latest survey, the cost of constructing the Nicaragua Canal will be ten millions sterling, and the time required for construction six years. The summit level of the canal will be 110ft. above mean sea-level, and will be reached at each extremity by three locks, each 650ft. long and 65ft. wide. An artificial lake and repairing basin for ships in transit will be created by means of a dam across the San Juan River, and an embankment across San Carlos, near their junction; and from the last lock to Greytown on the east and Brito on the west the canal will be enlarged, thus forming an extension of the harbours where vessels can pass each other without detention. The length from Greytown to Brito is 169 miles. The most serious engineering difficulties will be in the great divide cut across the San Francisco range through a three-mile stretch of rock with an average depth of 120ft., and the restoration of the Greytown Harbour, long ago destroyed by the deposit of silt from the San Juan. The International Company was incorporated in San Francisco in May, 1893, to aid in the construction of the canal from Brito to Lake Nicaragua—the Pacific end of it.

Mr. R. B. Eastman, a Brooklyn architect, recently brought a suit in the American Courts, against King's County, to recover some eighteen thousand dollars, as compensation for services rendered in the preparation of designs for a group of buildings, asylums and similar structures, at the request of the Board of Charities. After the plans were made, the cost of carrying them out was found to be so great that the idea was abandoned, and the architect's services seem to have been forgotten. Mr. Eastman asked several times for payment, but was repulsed. Four years after he had done the work, he commenced suit against the county for compensation, claiming 2½ per cent. on the estimated cost of carrying the plans into execution. As he had still in his possession a letter from the Chairman of the Board requesting him to make the designs, and another letter from the same person acknowledging the receipt of the drawings, there could be no doubt of his employment; and Justice Cullen, before whom the case was heard, decided that his claim was just and reasonable in every particular, and directed him to present the bill for payment to the Board of Supervisors. If they should refuse to pay it, the judge told Mr. Eastman to apply for a writ of mandamus to compel payment. The counsel for the Supervisors, however, advised them not to resist payment; and the bill was accordingly accepted, audited and paid, with interest.

The tar obtained in the manufacture of oil-gas is, says a German contemporary, subjected to fractional distillation up to the temperature of 250° C., when about 11·35 per cent. will have distilled over. The remaining 88·65 per cent. forms a glossy black mass, having the consistency of honey, and a specific gravity greater than that of water. It is dissolved by the aid of heat in about half its weight of volatile hydrocarbons, such as benzine and the like, and a paint for coating ironwork is thus obtained which dries very rapidly, adheres well, and does not crack or fall off. It will penetrate through iron rust and prevent further oxidation of the iron. Manganese or lead driers may be added if desired.

The annual convention of the American Institute of Architects is to be held in St. Louis, Mo., on the 15th, 16th, and 17th of October.

The Admiralty have decided to build a new block of twelve coastguard houses at Sandgate. The existing buildings suffered seriously in the landslip there.

The opening of the new Roman Catholic church at New Hartley was solemnised on Tuesday by Dr. Wilkinson, Lord Bishop of Hexham and Newcastle. The church which is dedicated to "Our Lady and St. Wilfred," is constructed of white bricks with stone dressings; it is 80ft. in length, 25ft. in breadth, and contains sitting accommodation for 300 persons. Its estimated cost is £1,300 exclusive of fittings. Mr. C. E. McCann is the architect. It is situated in close proximity to the Hartley shaft, where the lamentable catastrophe occurred in 1862.

The memorial-stone of a new church dedicated to St. George was laid on Tuesday at Cwmparc, Rhondda Valley, by the Bishop of Llandaff. The cost of the edifice, which is estimated at £4,000, is defrayed by Mrs. Llewellyn, of Baglan, near Neath, who three years ago built, at her own expense, St. Peter's Church at Pentre, Rhondda, the edifice and organ costing £25,000. Two other large churches are being built at her expense in the Welsh coal-mining districts.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2125.

FRIDAY, SEPTEMBER 27, 1895.

ELEVATIONS OR PERSPECTIVES AT THE R.A.?

At a time of year when those of us who have any works important enough to exhibit are thinking about making drawings of them for the next Academy exhibition, Mr. Chisholm's paper in the Institute Journal of last week comes opportunely. Mr. Chisholm thinks architects have a grievance. When they draw their own views, the Academy is apt to reject them, and what makes this more annoying is, that it hangs views of buildings which are no better simply because they are better drawn. We believe there is some truth in this statement, and it is very natural that there should be. Of the forty R.A.'s, more than thirty would hardly pretend to any acquaintance with architecture as an art. If they are at all in advance of "the man in the street," it is simply in knowing that they do not know; for whereas he always thinks himself gifted by nature to judge of all the buildings he sees, they must have learned enough of art to remember the need of culture and training. But they can all tell whether a drawing, as such, is good or bad. In choosing between drawings they therefore rely on this knowledge, and the result is that many indifferent designs are exhibited, and possibly some meritorious ones are thrown out. This state of things has produced a result which Mr. Chisholm appears to think very undesirable. A race of professional illustrators of architecture has sprung up who either draw, or more frequently merely shade and finish, perspectives for architects who have no time or no knack of working them up into pictures. We do not see that this is such a terrible evil; but Mr. Chisholm thinks that "it touches the very existence of architecture as a profession," and to get rid of it he proposes three things. One is, if we understand him rightly, that the Academy should be readier than it is to exhibit mere elevations; another is that the name of the draughtsman of the view, and not of the architect of the building, should be published in the Catalogue; and the last is that the Academy should rigidly exclude models, photographs, and the like!

It is interesting to trace the process by which a gentleman who has evidently thought much about the subject comes to advocate a remedy which would be incomparably worse than the disease. The train of reasoning seems to be as follows: An architect is, or should be, an artist. What, then, is the work of art that he produces? It cannot surely be his building, for he probably never worked at it himself. It cannot be his plans and sections, because the making of these, we are told, "does not constitute a fine art." Therefore it must be the making of elevations, "which are the only [artistic] work of his own hands which the architect has to show," and the inference is that elevations, drawn by his own hands, are what he ought to exhibit at the Royal Academy.

We have here, in a concise form, several of the most mischievous fallacies of the period. It might be enough to judge of them by their fruits, and to show that they have led a thoughtful architect to advise the astonishing course which we have quoted above. But we will take one or two of them in detail. There is, first, the fallacy that a man's art must necessarily lie in the work of his own hands: in other words, that unless he puts before the world some actual thing which he made by his manual labour, he is not an artist at all. What sort of artist, then, is the very highest - the poet? No artist, on this theory, unless he issues his poems in his own handwriting. If they are printed, Mr. Chisholm must, in consistency, acknowledge that they cannot be art. The poet did not set up the types or pull the press. His volume, therefore, not being the work of his own hands, he deserves no artistic credit for it, and when it is published it is the printer's name, and not his, that ought to appear on the title-page. What sort of artist, again, is the composer? When Beethoven played his own sonatas, this singular doctrine would allow him the name: he was then the artist, and they were works of art. But now he is dead, and cannot play them, they must be works of art no longer. When they are played, it is not by his hands, consequently he is not the artist to whom we owe them. When we hear them we should never mention him, but ascribe all the merit to the pianist. What sort of artist, once more, is the dramatist? He is even worse off than the composer, for, unless he can act a whole play by himself, he is scarcely even an artist while he lives. The part of Adam in "As You Like It," and the part of the Ghost in "Hamlet," may once have been works of art; for, according to tradition, Shakespeare not only wrote, but acted them. As to the rest of those plays, and the others which pass by his name, he merely composed them, invented them, designed them, for actors to execute: just as the architect composes, invents, or designs a building for workmen to execute. If doing this for a fine building does not make the architect an artist, then doing it for a fine play cannot make the dramatist one.

The next fallacy is implied in saying that "the making of plans and sections does not constitute a fine art," though it seems that the making of elevations does. Here we get a plain avowal which lends support to the popular opinion about our profession. "Architects," the public are fond of saying, "care about nothing except the outside of their buildings." The public only show by this that they are often unfortunate in the so-called architects they meet with; for the man who does not feel a primary interest in the interior of his building is no architect at all. Mr. Chisholm does not deny that he ought to feel this interest; but he apparently implies that there is nothing artistic to be made out of interiors. If there is, plans and sections evidently stand on the same footing as elevations, for they exhibit the inside of a building in the same way as that in which elevations exhibit the outside of it. In all three cases, it is a way in which no mortal can ever see it. Mr. Chisholm seems to think that this is a detail of no consequence. He says the man who cannot understand an elevation is destitute of an educated eye, and that his opinion, even on a perspective, must be valueless. It cannot be too plainly stated, on the contrary, that no man living can be sure of understanding an elevation without a plan to help him; and that even then, however complete his training may be, his conception of its actual effect is likely to be vague, unless he makes some slight perspective sketch of it. Elevations hung up without plans would often be grossly misleading; and even with plans they would be understood by few people except practical architects. Now, Mr. Chisholm says, in so many words, that "the making of plans and sections does not constitute a fine art," and that "the Academy authorities should rigidly exclude objects which it is impossible to raise to the level of fine arts." His proposal, therefore, amounts to this: that exteriors should be illustrated in a way which would often leave them quite unintelligible, and that interiors should not be illustrated at all!

It is a fallacy, again, and a very injurious one, to suppose that a building should first be thought out in plans and sections which have nothing of art in them; and that the architect should then take the exterior which happens to spring out of these plans and sections, and turn it into architecture by subsequent manipulation. This is a popular delusion, not only about our art, but as to others. We heard years ago of a notorious producer of sculpture who, in the course of a trial, was stated to have modelled the figures himself, and then to have employed a "ghost" to give them "artistic merit." But artistic merit lies deeper down than this. It is not, in architecture any more than in sculpture, something which can be put on or scraped out of the mere surface of a work. Our art, even more than others, has to do with general masses and groupings, not merely with details. The producer of the street pot-boiler, it is true, thinks otherwise. His building settles itself, as to general form or want of form. Nine times out of ten it is intrinsically a shapeless abortion. This does not disconcert him; he does not know or care that architecture means anything but finery applied to cover up deformity. He sticks his "front" over with pilasters and cornices, he turns a carver loose on it, and at last the man in the street pronounces it very good. But this is not the sort of work which any of us want the Royal Academy to encourage. It is only too ready to exhibit drawings of it already, and it is a pity that anyone should make suggestions which, if adopted, would lead it to exhibit more.

In spite of all these points in which we are at issue with Mr. Chisholm, we are in sympathy with what seems his underlying purpose—that of preventing the architectural part of the R.A. exhibition from sinking into a mere display of draughtsmanship. But we fear that this is just what his proposed alterations would more and more make it. It is not only in perspectives that draughtsmanship is liable to be rated higher than design. The same thing would happen in elevations, even if they alone were admissible. Few architects would draw their own—Why should they? and the only result would be that the professional perspective draughtsman would become, or be superseded by, the professional geometrical draughtsman. The putting of the draughtsman's name in the catalogue, and not that of the designer, can hardly be seriously intended. Of course, its only effect would be to make the public think, even more than they now do, that draughtsmanship is everything and design nothing. The architects would turn out—as far as reputation goes—from the one room which is left to them at Burlington House, and the draughtsmen would reign in their stead.

Mr. Chisholm, however, will not have written in vain if he leads his readers to see what the "manual labour fallacy" and the "applied art fallacy" do actually lead to. The latter one especially is the curse of England, and, as a friendly American architect remarked who criticised London buildings two or three months ago, it spoils our doings everywhere. Even our best men can seldom quite outgrow it, and it is as true now as in Pope's time that we "hide with ornament the want of art." The manual labour fallacy, on the contrary, is that worst of falsehoods, the falsehood that is half a truth. It is true that an artist, where he can, should not only invent his work with his own mind, but execute it with his own hands. Those hands will obey his brain as no other hands can do, and hence it is that a carver, for instance, ought to be able to invent for himself, instead of trying to copy what a draughtsman has invented for him. But then there are wits, like ours, in which it is practically impossible for the designer to execute his own designs. They are none the less works of wit for that, and their designer is none the less an artist. Their origin was in his mind, and he has produced them in the only way in which the facts of existence allow them to be produced. Our choice is between having them in that way, and not having them at all. In them the manual labour of the designer is out of the question. St. Paul's is a work of art, although Wren did not hew its stones himself; and it is a work of art of which he was the artist. If people will not have architecture on these terms, then they cannot have architecture at all; neither, if they are consistent in their principles, can they have poetry, or music, or the drama.

WEST HAM TECHNICAL INSTITUTE AND FREE LIBRARY COMPETITION.

NO fewer than 73 designs have been sent in for the proposed new Technical Institute and Public Library for West Ham, and are on view at the Public Hall, Barking-road, Canning Town, E. The site is a good one, surrounded on three sides by roads and an open space, and its main front is towards Romford-road, a wide and important thoroughfare. The designs that have been selected by the assessor, Mr. J. MacVicar Anderson, P.-P.R.I.B.A., are the following:—The first premium of £250 has been awarded to the design of Messrs. Gibson and Russell (No. 34); the second premium (£150) to the design by Messrs. Clark and Hutchinson (No. 51); and the third (£100) to the design of Mr. Thos. Davison, A.R.I.B.A., of Chelsea. To confine our remarks to these three designs, one may at once admit that the assessor has been justified in his choice of the first of them. With a few exceptions we shall point out, the plan is an able one, showing a skilful distribution of the departments, which are well placed on the ground, with some idea of architectural propriety and symmetrical order. Looking first at the ground plan, the authors have, with the exception of three small courts, covered the area, though the library department and lecture theatre are only of one story, top-lighted, thus leaving plenty of air-space between the surrounding blocks of the Institute and official departments. The library occupies a large portion of the space facing the Green and Water-lane, and is separated from the other block by a straight wall and by a corridor. The lending library, 55ft. by 47ft., is placed at the corner of the above-named sides, the lobby entrance for the public being in Water-lane. We think the space for borrowers contracted and rather spoilt by the projecting vestibule, and the arrangement of counter might be arranged better. A one-story domed reference library 38ft. square adjoins, lighted from a court. A reading-room, 110ft. by 38ft., top-lighted, comes next to right of entrance. The lecture theatre, with its main entrance for the public in the centre of the Water-lane side, is shown, 70ft. by 44ft., with a platform recess at the inner end to accommodate 500 people. Cloakrooms are well placed on each side of the entrance, and conveniences are placed on each side of platform, which is bounded by a long corridor along the eastern row of workshops. On the south side of the lecture theatre are two courts for light and air, between which runs the main corridor from Romford-road entrance. The women's laundry, cookery, social rooms, &c., complete the Water-lane block, with a distinct entrance. The Romford-road front has a centre entrance leading to a transverse corridor, with convenient staircases taken out of the angles of the courts which light it, and is called the "museum hall." In front, facing this road, are the men's social rooms, store-room, clerks' and secretary's offices, and board-room, the latter at the south-east corner. On the eastern side is a range of buildings for workshops, traversed with its own corridor, and entrance at the Green end. The women's and men's corridors and entrances are distinct. The first-floor plan is given up to the technical department. It shows two lecture-rooms, 50ft. by 32ft. each, facing Romford-road, with classrooms 24ft. square, and some of smaller width along the Water-lane front; the art school, containing art master, wood-carving, design, modelling, elementary and advanced drawing-rooms, on the northern side, facing the Green, the best position for a north light. These rooms have their own corridor along the inner side. The laboratories are placed end to end along the eastern side, with their corridor of access, and are thus well out of the way. Thus, the main corridors run round the four sides of the rectangle, and are well lighted from the courts. The sections show the large lecture theatre, 28ft. high to the flat, segmental ceiling, which springs from cantilevers at the sides. The roof is of iron, trussed, and the lighting is obtained through clerestory windows above the reading-room, also from the courts on the south side. The separation of the departments is not so clear and distinct as we might wish, especially between the library and technical departments; but the entrances and corridors can be arranged to meet the requirements. The design externally shows much artistic skill and feeling. The Romford-road façade has a well-balanced and appropriate treatment in its long front, broken by circular pediments and turrets. The deep band of relief ornament below the engaged Ionic columns of the front is drawn with much spirit; the inter-columnar treatment of windows of lecture-rooms is a nice feature, and the detail of the circular pedimented porch carried on trusses and carved seated female figures or caryatides is clever, though this and the carved frieze may be said to be more spirited than appropriate to the position they occupy. An artistically-drawn detail to a larger scale is given of these features. There is, perhaps, also a want of rhythm between the circular-headed porch and the rectangular-shaped window at the side. The Water-lane elevation is broken by three circular pediments, the centre one being a porch to the large theatre. A cupola is over the library entrance vestibule. The perspective, a clever pen-and-ink drawing, shows a well-broken and picturesque design.

The second premiated design is distinctly blocked into departments. The technical schools and lecture theatre block is the largest, and occupies the main portion of area bounded by Water-lane and Romford-road, the main entrance to the Institute being in the centre of the latter, with women's and men's entrances on either side. These latter are the ends of corridors which give access to the lecture and classrooms on each side. Those facing Water-lane are for the women. The lecture theatre is central, 72ft. by 43ft., with platform at northern end and a corridor approach from Romford-road, and is lighted on either side by courts. It has a timber roof. The main front is occupied by the women's social room and classroom on left of main entrance, and on the other side are the men's social room, board-room, office, &c. Men's cloak, refreshment, and classrooms are in the east wing. The authors make a similar mistake to others in placing their art schoolrooms along the south front. These rooms have south windows, but are top-lighted in the roof on the north side. This arrangement is not happy. The corner angle staircases and lavatories are convenient, and are taken out of the open courts at the angles. These are large. The lecture-rooms (56ft. by 36ft.) are at the ends of side wings. The library block occupies the north-west corner of area, and is entirely on the ground floor, like the first premiated plan. It contains a reading-room, 95ft. by 37ft., with one side and end lighted, besides top-lights, an entrance-hall, 28ft. square, with top-light; reference library, 43ft. by 28ft.; and lending library, 88ft. by 33ft. A long corridor, top-lighted, separates library block from institute building. The corridors are well lighted by the courts. The workshops are located in the basement. The elevation to Romford-road, two-storied, is symmetrical, of a Classic character, and of rather commonplace type.

The third premiated design shows the area well occupied, and small courts for light and air. The library department is placed towards Romford-road, the reading-room facing the road, broken by bay windows, and the technical institute on the north portion of area. The principal entrances both for library and institute are in Romford-road, and public entrance to lecture-hall on the Water-lane side. The hall is 70ft. 6in. by 41ft., and has a circular-shaped platform, and is placed east and west on the north side. The first floor contains the lecture-rooms next the Green, and classrooms in front, and on the second floor the laboratories facing Water-lane. The art-school rooms face Romford-road, but have north lights. The general plan shows study: the lecture-hall is a one-story building, and the library is top-lighted. The building is freely treated in brickwork in a sort of Renaissance, and is mainly a three-storied building, with gables in front.

Other designs, in our minds, compete closely with the three selected. Though there are unquestionable merits in those we have described, there are two or three others which possess features of plan and design which entitle them to rank with the first. No. 70 is one of these. The plan is somewhat irregular in distribution, but the blocks are so placed as to afford ample light and air to each of them; they are practically isolated. The library block, facing Water-lane, has the reading-room and lending library end to end, with entrance between, well lighted by windows. A spacious borrowers' lobby is shown in the lending library, with book store behind. The bayed recesses are also excellent features. The institute building faces the Romford-road, and is mainly separated from the other buildings by courts. The principal entrance is in the centre, which leads to a cross corridor giving access to the physical lecture-room, board-room, men's and women's social rooms, &c.; and the lecture theatre forms a distinct building, 80ft. by 56ft., its end towards the eastern boundary, and at an oblique angle with the main front block. The first floor has the physical lecture-room, and also the classrooms along the Romford-road front, and staircases; while on the floor above is the chemical lecture-room over the physical, and the drawing-rooms in front. The design is conceived in a picturesque English Renaissance spirit, with high roof, gabled ends, and turrets accentuating the main staircases at the inner angles of the wings; also a centre turret on centre of roof. A strong ink perspective, rather inky in part, shows a well-broken and pleasing building. A similar general plan is No. 18, we believe by Mr. E. T. Hall. The library block is placed to the oblique line of the Water-lane boundary, and the reading-room is widened by bays on each side. Next to it is the large hall, with corresponding bays, 72ft. by 46ft., and an octagonal end. The institute building is opposite Romford-road; the board rooms, chemical laboratory in front, with classrooms behind, in connection with lecture-rooms on east side. By this plan a larger open quad is obtained, and all the buildings have light and air. We notice also that the art schoolrooms are on the first floor behind corridor of front block, and have a good north light. The large quadrangle is available for tennis-court, future gymnasium, &c. The author's design to the main road is a bold adaptation of English Classic features; at the corners massive square towers surmounted by cupolas emphasise the front, and smaller cupolas flank the main entrance. No. 26, a very able and carefully worked-out design by Mr. W. Harrison, deserves attention for a bold departure; the library building is placed on the western side of an isolated block, the reading-room along Water-lane with a spacious entrance, and the reference and lending libraries in the front block square with road, having a main entrance to library in a bold projection carried up as a massive tower (as in the last-named design), which serves also as a staircase, and this is repeated at the other end. The main entrance is in the centre—Romford-road — and the hall practically separates the library from the institute building. It is spacious and has a good staircase, with lavatories and cloakrooms, &c., beyond in a distinct block—a desirable arrangement. The eastern institute block is surrounded by corridors lighted from a centre courtyard; the board-room is in front, and laboratories behind. One important feature is the position of the lecture theatre, 80ft. by 42ft., which is on first floor on the Water-lane side over reading-room, so arranged as to be let off separately—a point of importance to the authorities. The classrooms are in front, and the lecture-rooms at the ends. The elevations are artistically and broadly treated, of Renaissance character, gabled in the front, and the corner towers of main front give dignity to the design. The lecture-hall is emphasised as a separate building on the Water-lane side, with its two main entrances and stair. The author places his workshops in the basement, and his art school in second floor is well lighted by a north light, and has a front corridor.

The plan No. 21, by Mr. Sidney R. J. Smith, is also planned on the principle of two distinct blocks, the library placed along the Water-lane side, with its own entrance, and forming an acute angle with the institute building fronting Romford-road. This plan permits of open instead of closed courts, and of a more efficient separation of the main teaching and administrative departments. The author, who has built several important libraries, has given ample space to the public in his lending library, which is 80ft. by 51ft. 6in. On the other hand, many of the designs show very cramped arrangements, and the counter for borrowers is not long enough for the indicators. A well-placed office for librarian is shown between the lending and reference libraries, the reading-room on right of entrance, 85ft. by 41ft., is in the corner between tho two roads. The institute block is well arranged: a separate and isolated block in the rear of the front building to Romford-road is reserved for classrooms and laboratories, and is joined by a lobby to the main part; the entrances for men and women are separated on either end of the front, with their social rooms and cloakrooms in convenient positions. The stairs and lavatories are well located at each end of main corridor. The lecture theatre, 62ft. 6in. by 47ft., with platform, is situated along the east side, with separate entrance in Romford-road, and ample cloakrooms, &c., in the rear. On the upper floor are the lecture-rooms, 46ft. 6in. by 30ft. 6in., each facing south, and classrooms on left and right. Laboratories are placed in the detached block behind above classrooms. The library and hall are roofed on a lower level, and the architectural treatment is well balanced with octagonal turrets and cupolas at the corners over preparation rooms and a centre flèche. The art studios are north-lighted, with front corridor facing Romford-road. A carefully prepared and able design is No. 65—by Mr. J. M. Brydon, we believe. It is shown by a well-drawn set of drawings in an English Late Century Classic style with pediments, the two end ones of circular shape, with cupola over centre. The library block is on the Green side, with main entrance; the lecture-hall is placed parallel to it, with its entrance in Water-lane; and the institute block, occupying the largest portion of the site, faces this and Romford-road, where the main entrance is placed. This block is of quadrangular shape, round two open courts. The central hall and stairs in line with the main entrance are lighted from them, and in the rear, separating this block from the lecture-hall, is a row of one-storied rooms for engineering workshop, dynamo, &c. An inner corridor traverses each side of the institute building, lighted from the courts, and a surrounding corridor is also shown to the lecture theatre, which is 80ft. by 40ft., and is lighted by clerestory windows above the corridors. There is a good crush-room, forming a vestibule to the theatre, and the dressing-rooms and cloakrooms are convenient. The library block is single story and top-lighted, with side windows on three sides. The theatre or hall has an elliptical ceiling panelled for painting, with wall pilasters and ribs, and the drawings are well executed. We note that the lecture-rooms are on first floor behind, classrooms in front, each 45ft. by 35ft., good positions, and that the laboratories face Water-lane, and the engineering shops are well placed and single-story. The workshops are in the basement on Water-lane side, and the art school in front is well lighted. The main stairs and corridor approaches are excellent.

We can only very briefly mention a few other designs of exceptional merit Some of these are on the open or isolated block system, others quadrangular and inclosing courtyards. Of the former kind is No. 15, in which a circular domical reading-room occupies the centre of the main front, of the Radcliffe Library type; the design is of a Georgian Classic character, picturesque in its outlines, and with corner tower. A long lending library is behind. The institute building is towards Water-lane, with a central entrance and lecture theatre in rear, 64ft. by 42ft., with convenient class and retiring rooms. The physics lecture-room at the north-west corner, and a range of workshops facing the Green. Above are classrooms along Water-lane, art schoolrooms on north side, with inner corridor approach; chemical lecture-room at end facing Water-lane. No. 49 is L-shaped, with acute angles. A symmetrical front building of three stories, with octagonal entrance, tower, and massive projecting wings at the ends, of Renaissance character is shown by a clever ink perspective. The library block is at the north end of Water-lane, and women's department south end, and lecture theatre at south-east corner, with separate entrance, and a corridor connecting it with the institute rooms and library. A circular corner between Romford-road and Water-lane. The men's and women's departments have good entrances. No. 32 is a clever, artistic sketch, with a nice breadth of treatment; but the plan is wasteful, and the corridors badly lighted. No. 46, we believe by Mr. E. W. Mountford, shown by a nice ink perspective in a Classic Renaissance style, is another of the able quadrangular symmetrical arrangements, with two courts for air and light. The library is on the west side, with centre entrance and court, and the institute building and lecture theatre on the east side. The position of library attendant would have been better in the angle of reading-room; as shown, he could not see more than a small portion of the room. A number of bay windows break up the two main elevations, and there is a central tower on south side, serving as main entrance to the institute. The lecture theatre is of too square a proportion, and its accessories inadequate. The author has studied compactness. Clever drawings accompany No. 30; the corridors are not all well lighted. No. 17 has a cleverly-drawn perspective sketch, but the plan of departments is weak. No. 60 also shows a rectangular type, with some good planning; and No. 61 is of the same class, with open courts, the lecture-theatre on the east side, projecting. The smaller lecture-rooms are placed one over the other in the centre of building, side-lighted by the courts. The library is at the north side, with its own court and entrances, and the classrooms along Water-lane. The design is of Late Gothic character in the details. An able design is No. 69. The plan is symmetrical, with centre court, classrooms on the north side, with lecture-rooms in centre, with inner corridors lighted by court, and the library building is in front, with projecting newsroom as a wing on west side, and a corresponding block for lecture theatre. The technical school and the library entrances are both arranged in front. Nos. 28, 47, 55, 57 are well-considered sets, with some good planning, though wanting in classification, and, in one or two instances, costly in style, as in No. 28.

The committee have to be congratulated for having evoked so much talent. They have every reason to be satisfied with their choice of the first design; but in some respects, at least, the other two premiated sets will hardly compare with one or two designs we have spoken of commendably. That the departments should be separated as far as possible by open areas or by straight party-walls rather than by corridors and halls appears to be essential; that the lecture-hall should, if practicable, be a distinct and isolated building capable of being cut off from the other other departments, cannot be doubted, and the same separation appears to be necessary between the library and institute building. The ground floor is no doubt the better level for a public hall, though there are a few good plans which show it on the first floor and without inconvenience. Another important consideration is the position of the laboratories and workshops; there are good reasons for placing them on an inner or rear position; the former, or at least the physical laboratory, ought, if possible, to be on the ground floor, to insure freedom from all vibration, and the workshops and dynamo-rooms ought either to be isolated or placed in the basement, as the heat and noise from these ought not to incommode those engaged in other avocations. The cost of the building has been limited to £40,000.

CONTRACTS, SINGLE AND SEPARATE.

THE one-contract system as against the many-contract system appears to be exercising some interest both here and in the United States, amongst contractors and the profession. If we were to array a host of facts on both sides it would perhaps be seen that with few exceptions the client benefits by the employment of several contractors. Each has a stake in carrying out his particular work well for his own sake and reputation. A large American association of manufacturers have in a recent circular declared that the single-contract system favours bad workmanship, because it is for the general contractor's interest to employ the cheapest sub-contractors he can get. There is some truth in this indictment. A low tender for the work having been accepted, an architect cannot conscientiously complain about the contractor's selection of workmen. They are not entirely under his control, though he may make a proviso in the contract reserving to himself the right to approve or reject the sub-contractors. He can only exercise his right of rejecting any work done, say mason's work, if contrary to the specification, of condemning the quality of the stone, or the mode of laying it or executing the masonry. Again, it has been urged for the many-contract plan that the architect has an opportunity of settling questions of detail with the several contractors, of discussing with each matters which, under a general contract, he would have no chance of doing, of trying artistic experiments, and of making any little variations to the advantage of the building and his client. It would be much easier, for instance, to consult with A, the bricklayer, who has an independent contract, about a point of detail before deciding on the design, than it would be to go to the general contractor and tell him what he would like done. The latter would probably refer to his quantities and find the price affixed to the item too low to admit of any extra, and not being a practical bricklayer like A, he would hesitate to meet the architect's wishes. Mr. A, as a practical mechanic, could, on his own responsibility, decide to make any small deviation. The difference in each transaction is simply this: The general contractor is a middle-man—he cannot treat directly; but in dealing with A, the architect is brought into contact with the actual worker who has only himself to consult. These are unquestioned advantages of the many-contractor system which it would be hard to overlook. Again, the principle of the architect being brought into direct touch with the craftsman is favoured by this system. Every trade is under the immediate supervision of the master-mind instead of all being lumped together, and treated as an aggregate that can be manipulated under the contractor for his own advantage.

There are, of course, disadvantages of separate contracts. One is the increased trouble it is said to entail on the architect. Separate agreements must be prepared and negotiations made; supervision is increased; instead of holding one man responsible, each contractor has to be dealt with and reckoned with; there is more friction to be overcome in arranging their several duties, so that there may be no overlapping and all may work together harmoniously; and lastly, there is, some imagine, more expense in obtaining several tenders than in only one, though this is disputed, as in the one-contract system each sub-contractor must get a profit, and the general contractor a profit on the whole. Without any doubt all these disadvantages are intensified when the architect is inexperienced and has an imperfect control over the several trades, and it is just in proportion to this want of keenness in adjusting them that the single-contractor system is an advantage. A vast deal of trouble is taken off the shoulders of the architect by the intervention of a functionary who can select his own tradesmen, arrange the details of their labour, superintend the operations, and become personally responsible for their work or shortcomings. The general contractor is such a person, a useful intermediary; he guarantees the several trades. When we consider a building as an aggregate of many skilled labours, that it employs a number of craftsmen, it seems reasonable to conclude that a system which undertakes to provide all these factors, and to place one man in the position of many who makes himself responsible for all risks, is a more convenient system than that of dividing the contract.

Other considerations may help us to form a conclusion as to which of these methods of carrying out work is the more desirable under particular conditions. Special and artistic forms of building can only be done by men who have made the work the one of their lives, not one of commercial gain. A skilful bricksetter or mason learns his craft by a long apprenticeship, or by assiduous study in a technical school; he makes it his own work by personal attention, and to him the principal object of his life is to turn out skilful workmanship, no matter what his labour costs. Happy he who finds a scope for, and employment in, his work without any grinding down or cheapening process; but, alas! the competitive spirit of the day comes in between him and his labour. It says: You must do this cheaper, or turn out so many more feet or rods a day. If necessary, you must substitute for the older and proper method of execution one that is less laborious and requires less skill, but looks as good. Here the temptation comes in to scamp the workmanship, and make the material spin out the farthest. Everyone knows how easily these commercial demands can be met in brickwork and masonry by methods of bond, which makes the greatest display of face-work, and economises labour by using "stretchers" and "bats" and thin facing stones. The workman who really wants to do his work well positively cannot do so. Some one else steps in, and says "You must do it quicker, or make the material go farther. What you have been taught may be right, but it does not pay." These are the suggestions of the contractor. The "great unskilled" are ready to accept the task and its conditions, and what ultimatum is there for the skilled but to comply or starve? Again, the true honest workman always has sympathy with his work; he displays it in every joint and every chisel-mark, the way he lays his bricks and sets his stones; but there is no room for this in the hurried contract work of the day. The very hurry of modern work prevents anything like sympathy being felt. Well may a recent novelist in his very thoughtful book, "Six Common Things," dwell on the dismal tragedy of London life, and work the "ceaseless stress" of men and woman who are all hurrying, who may not stop, and have not time to think. "This hurrying," he says, "has become a necessity of the crowd, whose leisure is as feverish as their work." And, after all, so much depends on the hirer of the workman, upon whether he is the owner himself and wants good work, or only an intermediary who is trying to "farm" the labour and to make profit out of the workmen. Is it the owner or his agent, the architect, who obtains the bricklayer, mason and carpenter, or the contractor, who has undertaken the work for so much, and wants to see a clear profit? When we enter more closely into the details of workmanship, we may make this question a little clearer. Let us take woodwork. It makes some difference to the carpenter and joiner if the material he works in is the best that can be got, and supplied without stint; that he knows a foot or two superficial of deal is of no importance, or that an extra quarter or half an inch of thickness can be had without demur. He has heart to do his work better, because he feels he is not restricted to an inch or so of stuff, and he can make his joints with more care and finish. We all know what most modern contract work is. It is a name too often for all that is meagre and scamped in execution and finish. Why? Because the competitive element enters and compels the artificer to adopt the easiest and quickest method. The bare workhouse or barrack represents the spirit of the work. The cold bareness of walls and ceilings, the tiring repetition of windows and doors, all made after one pattern, are the qualities which distinguish this class of building. But the skilled artificer likes to see evidences of his thought and skill. And these reflections bring us to distinguish all workmanship into two clases, the Mechanical or repetitional, and the Artistic. The modern contract system favours the first; it enables a large quantity of work of a particular kind or pattern to be turned out with the least expenditure of labour, and we must always remember it was this class of building so largely called into existence by our commercial requirements, by the erection of workhouses, almshouses, factories, railways, and dwellings for the poor and middle classes in our larger towns that encouraged the contract system of carrying out work. The repetition of similar features, multiplication of details of the same kind, large quantities of brickwork, and roofing and flooring and plastering, anything, in fact, that can be easily turned out and multiplied by the rod, square or lineal foot, can be better and more economically estimated and performed by one man who employs a large number of hands, who can do such straightforward work, than by employing a number of more skilful artificers. What we mean is that a plain building having a number of similar parts, say, a large factory with solid walls and piers, and a number of iron roof-trusses, can be more profitably undertaken by a single contractor, and with equal satisfaction to the architect, than it would be by employing a number of special men, or making separate contracts for different portions of the work. It would be very different if several diverse parts existed, if the details were numerous and complex, such as we require in the construction of a large hotel or a costly mansion. Here each separate contractor takes his part in producing a complex whole. The general contractor cannot be supposed to know the requirements of each trade, or to direct or control the work of the joiner, the engineer, the plumber, or the decorative artist. These are trades which come within the second designation of special or artistic work, and they cannot be so easily estimated or priced in a bill of quantities as a rod of brickwork or a square of flooring. He who estimates must be a man capable of analysing each part, and of knowing the labour on each, how long it takes to make a joint or paint a panel; therefore, only the special tradesman or artist himself can give a fair estimate—fairer and less costly often because he knows exactly what is required, and the time he takes to execute it, while the general guess-work contractor would probably make a rough idea of cost, and add a large percentage to cover his ignorance. And the work itself is done better by men who have no one to hinder them or tie them down to a price. These are considerations which deserve the attention of architects who are intrusted with buildings in which the fittings and decoration constitute the main part of the design.

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—V.

By Joseph Horner.

THE test-bar is a beam in miniature, and the actions which go on in the test-bar go on also in the massive girder or column. The similarity, however, is not identical. In the first place, girders and columns are not designed and cast of rectangular section like the test-bars. The girders and columns are not so strong as the test-bar, because metal, even though sound when cast in large masses, is not so strong as that which is cast in smaller ones, and because in addition there are almost always some hidden defects in large castings which are not present in test-bars. Further, the test-bars are simply supported at their ends, while nearly all structural work is fixed at the ends. Thus a beam, the ends of which are built over, is fixed, and a column with flanges bolted above and below is fixed, and by fixing the strength of a beam is quadrupled. We will now pursue our subject on these lines. But as I do not want to mix up methods of calculation with practical work, I propose to devote the next few articles to the practical workshop results deducible from the lessons learned at the testing machine, and afterwards give a concise *résumé* of the most approved formulæ used in determining the dimensions and strength of beams, columns, &c. First, then, as to the sectional forms given to beams.

It is obvious from the facts relative to the differences of the strength of cast iron in tension and in compresion, with the high situation of the neutral plane, that the solid rectangular beam might be modified and altered with advantage to the section of the truncated isosceles triangle, Fig. 9, A. Also, supposing the section to be divided out into an infinite number of planes parallel with the neutral plane, and corresponding with the bending moments at these planes, the section of the beam might be represented by B, for tension and compression respectively. Then a practical form might be devised, as at C, and this might be developed into the suitably pro-

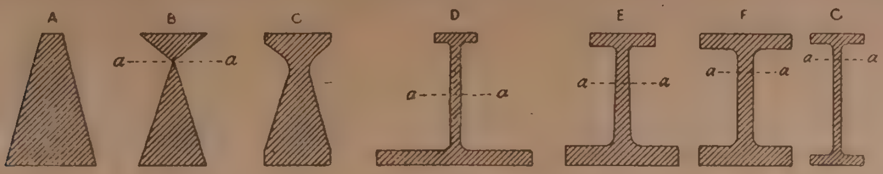

Fig. 9.

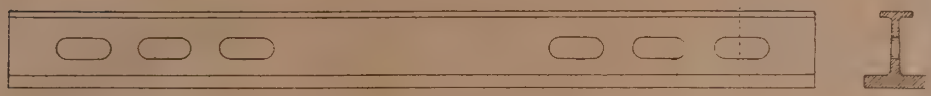

Fig. 10.

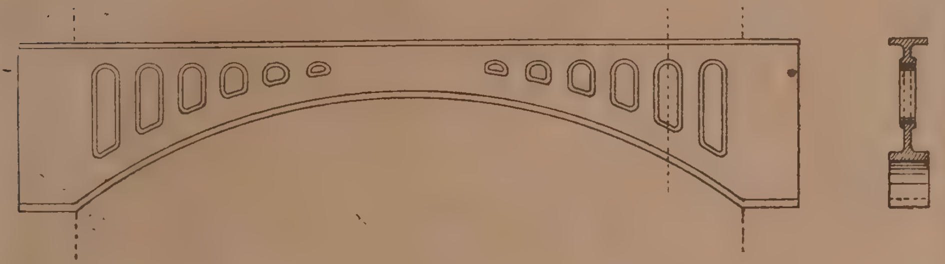

Fig. 11.

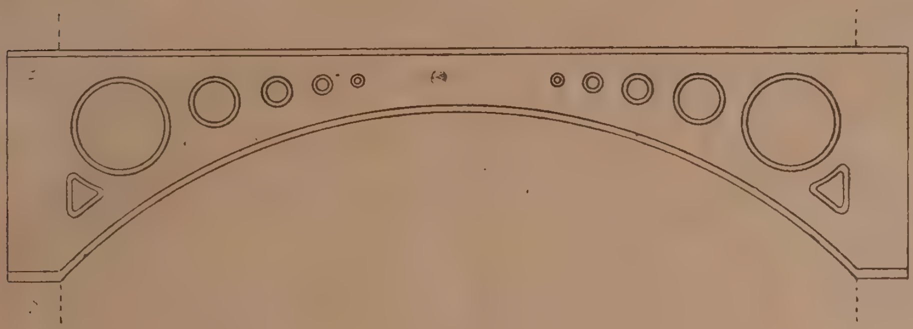

Fig. 12.

portioned beam of uniform strength, D, in which the top and bottom flanges are proportioned according to the difference which exists between the tensile and compressive stresses, and in which the web is designed, from practical requirements, stronger than is necessary along the neutral plane, but not stiffer than is necessitated by the stresses which lead to side buckling.

Such a girder as that shown in section at D is termed the "Hodgkinson girder," because Mr. Hodgkinson designed it as the result of his experiments on cast-iron beams. All that is ancient history now, and can be found in detail in many books, and I need not repeat it. But it is well to say that the conclusions of Mr. Hodgkinson have not been corroborated by more recent experimentalists, who have not been able to obtain such high results as his.

The form of the Hodgkinson beam, though designed in strict proportion to the moment of resistance, is a bad one in practice. It is troublesome to cast, and when cast it is not safe—first, because of the great disparity in the masses of metal; and, second, because if the load happens to thrust in a diagonal manner it will be thrown more on one flange than the other, causing fracture. Hence a compromise is made. The strength of the top flange is left altogether out of account, that of the bottom one only taken, and the latter is made narrower and thicker, as in E, which represents a well-proportioned section, strong and easy to cast. But often there is no difference made in the width of the top and bottom flanges, but only a slight excess of thickness in the latter, as in F. Frequently, too, there is no difference at all made, but the two flanges are alike, sufficient strength being given to the latter, the former being much in excess, as at G.

In all such work as this hard-and-fast rules and formulæ cannot be trusted. All the conditions of loading, and the nature of the material, and the sizes and proportions of the several parts of the castings must be taken into consideration. It has been proved, for instance, that beams loaded on one side—that is, on the flanges to one side of the central web—do not sustain more than half the weight calculated by Hodgkinson's rules. Of course, it will be said that this is not fair; but then such unequal loading does occur, just as unequal loading occurs in columns, with a similar diminution of their strength. Even if buildings are erected properly, unequal loading may occur subsequently through settlement of foundations. Then, again, large castings are never so strong as small ones, and badly-designed castings are weak from the first, and always weak. Metal, too, may be improperly selected. Hence the most perfect calculations based on resistances of the moments of a section to bending moments will fail if regard is not had to these vital matters. There is only one course of safety in cast iron, and that is after the calculations of strengths required by theoretical considerations to regulate the factor of safety by a consideration of the whole of the conditions which are known, or suspected to exist. Girders which are very disproportioned always curve in cooling, and the longer the girder the greater will be the amount of curvature. If there happen, too, to be pockets cast on the sides to receive trimmer girders, the metal is very likely to draw in the vicinity of the thick parts; whereas if the castings were more equally proportioned, so that one part would not cool off much quicker than another, the tendency to draw is much lessened.

In columns which, when long, are true girders, no difference at all can be made to correspond with tensile and compressive stresses, because these stresses will operate at all sections of the column indifferently, according as the directions of stress happen to be determined. Moreover, even supposing one side of a column was always subject to tensile and the other to compressive stress, then it would not do to cast the metal thicker and thinner to suit, because that would make the column crooked. Columns often do come from the foundry crooked for this reason, and when a column is thus bent, a difference in thickness may confidently be looked for. In reference to the neutral plane, the metal in girders is often lightened-out here. Figs. 10-12 illustrate how this may be done.

Fig. 10 is a Hodgkinson girder built into walls—a common form. The tightening holes are placed about midway between the top and bottom flanges, because the thickening of the lower, and the thinning the upper one, lowers the position of the neutral plane. It is usual not to cast lightening holes about the central part of the girder, though in strict theory they might be so cast with safety. Fig. 11 is a cast-iron girder for a light foot-bridge. In this the section is nearly uniform, and the lightening holes are placed above the centre to correspond approximately with the position of the neutral plane. The same remark applies to Fig. 12. The effect of alteration of section in raising or lowering the neutral plane is shown in the dotted lines *a*, *a*, in Fig. 9, and all lightening holes should be cast in these planes. The principle of lightening-out is correct and the application correct in the illustration given. But it is not judicious to lighten-out girders which are tied across with pockets and brackets, because the metal about the lightened portions cools off first, becoming rigid, and will not then yield to the shrinkage of the thicker parts adjacent, and the chances are that the casting will fracture through the holes, or if not fracture, will be in a condition of internal tension, and liable to fracture under a lower stress than that calculated for.

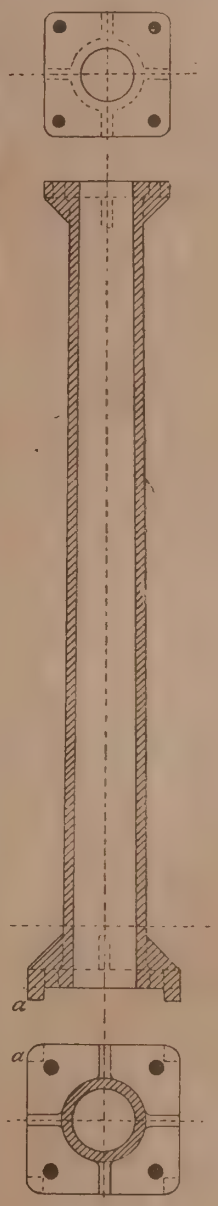

Fig. 13.

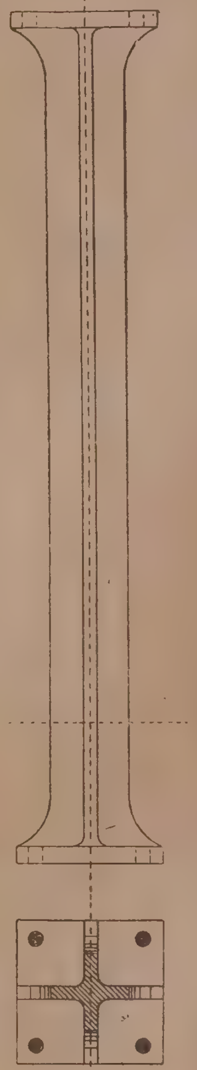

Fig. 14.

Fig. 13 illustrates a standard column, or typical column, in this respect—that it represents the most favourable conditions for withstanding the tendency to cross-bending. It has broad flanges, well bracketed, with bolt-holes for secure fixing. In such a column thus secured there is practically no tendency to diagonal stresses, and therefore there can be no cross bending. Practically, though not allowed for in formulæ, the column is in simple compression. If it failed, some conditions would first determine a cross-bending action in one direction, but up to the time when that would occur the stresses would pass wholly down the longitudinal axis of the column, and therefore be purely compressive. It is for this reason, therefore, to preserve this condition of stress, and to prevent all risk of incipient diagonal stresses which lead to cross-bending, that the ends of columns are, or should be, made with broad flanges, sufficiently bracketed and properly fixed. For the same reason it is of cardinal importance that columns should be perfectly straight, and in order to do this, cores must not be permitted to get out of centre, since thick and thin metal on opposite sides inevitably produce curvature in the casting. So that the curving of a column is not objectionable on the score of appearance merely, but it is an element of insecurity.

In columns which bed on masonry, joggles are often cast in the bottom flange, as shown at *a*, to fit into recesses chipped in the stone foundation. This is done to prevent risk of side movement, and then the hold-down bolts are generally dispensed with.

The stanchion, Fig. 14, is a true column. Though of cruciform section, the same principles are observed in its design as in that of the column, Fig. 13. The flanges are broad and well bracketed, and the casting must be straight. If it fails, it will fail by cross-bending. In a normal condition of stress it will be wholly in compression.

THE PROTECTION OF THEATRES FROM FIRE.*

THE protection of theatres from fire is a subject which has occupied much of the attention of the authorities of London during the past ten or fifteen years, and a great deal of good work has been done during that period under the auspices of the late Metropolitan Board of Works (and its successors, the present London County Council) in improving the existing structures, and enforcing the better arrangements of all new buildings of this class. This work has been done with a view to the prevention and extinction of fires, and the provision of the safety of the people frequenting places of public entertainment. Old buildings have been altered and many rebuilt, while new buildings have been erected under stringent regulations. The control of the London theatres and music-halls is under more than one authority as to licensing and the enforcement of good conduct—namely, the Lord Chamberlain, the police, and the London County Council; but the structural arrangements with regard to the prevention of fire are entirely under the supervision of the London County Council and its officials. It is my purpose in this paper only to deal with this structural control, and briefly to explain the methods now enforced in London. It would serve no useful purpose to quote the Acts of Parliament which give the Council their powers over theatres, &c.; sufficient here to explain that they have powers to make from time to time regulations as regards structural arrangements for the prevention of fire. It was my duty some years ago to prepare a draft of the regulations now enforced, for the consideration of the Theatres Committee of the Council, under the direction of the architect of the Council, Mr. Thomas Blashill, F.R.I.B.A., F.S.I. I will now dwell upon some of the chief features of these regulations as finally adopted in February, 1892. The chief difficulty which the committee had to deal with was to form a regulation as to site, for so many extraneous circumstances had to be considered in framing a rule which, while protecting the public, would not make theatre building prohibitive. London theatres are built by individuals or companies as investments to bring in a reasonable return for the outlay; there is no subsidy or State aid, the private purse alone being the source which can be drawn upon. Considering, therefore, that these buildings must be erected in the most crowded and fashionable quarters of the Metropolis, where land is the most expensive, the committee felt it impossible to enforce the provision of an entirely isolated site; for the cost of such land would cripple all theatrical enterprise, give no new theatres, and keep alive all the old ones. Therefore the regulation, as it now stands, only asks for one-half the boundary of the site to be upon a public thoroughfare, as diagram A. The committee were fully alive to the advantages of an isolated site and a symmetrical plan, with exits arranged on either side of the house in corresponding positions, and in order to meet the requirement of safety as far as possible a regulation was framed providing that two exits leading into different thoroughfares should be provided from each part or division of the audience. Now, as it would not always be possible, with only two thoroughfares, to comply with this rule, a "way" or "private passage" 10ft. wide was allowed on one side, to be accepted as suitable for the deliverance of exits, in addition to the two thoroughfares, as diagram B. The next feature of importance considered by the committee in framing the regulations was the construction of the theatre into three risks:—(1) The auditorium, with two exits from each part; (2) the stage, with brick proscenium wall passing through its roof and fireproof curtain; and (3) the dressing-rooms: the regulations as adopted enforce that dressing-rooms must be an entirely separate block with separate exits, quite apart from the stage exits. No theatre is now permitted to be built in London under or over any other building, or within a distance of 20ft. from overlooking windows in other property. The number of tiers is limited to three above the pit floor. The pit floor may be sunk below the street level, but not more than 15ft.; on the other hand, it cannot be placed more than 6in. above such level. The height between the tiers is defined as 10ft. between the pit and balcony ceiling, and 12ft. between the gallery and ceiling over. The number of exits, as I have already said, must in all theatres, &c., built or added to in this Metropolis, be two to every division of the audience, and the minimum width is 4ft. 6in. for each of the two exits to each division which contains not more than 400 persons. If any division of the audience exceeds in its seating capacity 400, then for every additional 100 (or part of 100) 6in. more must be added to the width of each of the two exits; 400 would require 4ft. 6in., 500 would require 5ft., 600 would require 5ft. 6in. in width, and so on up to a maximum width of 9ft. This rule applies to doorways, passages, staircases, and corridors. Any passage-way, staircase, &c., over 6ft. must be divided by a centre handrail. It is seldom, however, that this width is required, as the seating capacity of any one division does not often exceed 700 persons. Staircases must have steps of uniform tread and rise, and the flights must not exceed 12 steps or less than three steps. No staircase may have more than two flights of 12 steps without a turn. The landings must be square, and no winders are allowed. I do not propose touching upon the smaller regulations as to handrails, width of gangway between seats, wire covering to skylights, protection of constructional ironwork, construction of walls with brick or stone, &c., all of which are dealt with in detail in the regulations, but to pass on to the other regulations referring to the disposition of the more dangerous parts of the building. Workshops, store-rooms, wardrobes, painting-rooms are not allowed within the building proper; they must be separated from the theatre by brick walls and iron doors. The same rule applies to scene stores as well as to limelight rooms, gas-meter chambers, engine and dynamo rooms. This latter class of apartment must be fireproof throughout and perfectly ventilated. With regard to the use of the limelight, the Council have given much attention to the manner in which the gases should be stored and used, and to the class of fittings that should be employed, for it has been found that the careless use of the limelight is a most fruitful source of danger in a theatre. Most of the London theatres have, during the past few years, entirely discarded the limelight and adopted the electric search light instead, with the most satisfactory result, both with regard to safety and scenic effect. The rules as to the gas and electric light service are too detailed and complex to dwell on in full. They occupy some pages of the regulations and are purely technical. Separate gas services and separate meters are required (1) for the entrances, (2) for the auditorium, (3) for the stage. A dual system of lighting with oil lamps is enforced for safety; gas and electric is, however, accepted without any oil lamps as satisfactory. Automatic fastenings, which give way upon the public pushing the door, are the only fastenings permitted on doors which are not left on the swing during the time the public are in the building. The rules for ventilation include the provision of a smoke extract in the roof over the stage, and the manner in which the warming apparatus must be fitted up is set forth in full detail which need not be described here. With regard to the fire extinction, a plentiful supply of hydrants, with fittings of the same pattern as the Metropolitan Brigade, is chiefly depended upon. As a rule two hydrants are required, one on each tier in the auditorium, one on each side of the various levels, besides others in the approaches, dressing-rooms, and workshops. The usual provision for wet blankets, buckets full of water, hatchets, hooks, and other appliances is insisted upon. Exit notices are, of course, required over all the doors leading out of the theatre, and in addition to this in many theatres the safety lamps over the doors have "exit" painted upon the glasses. The construction of a theatre must, of course, be fireproof with regard to walls, floors, stairs, corridors, passages; but the regulations do not insist upon the tiers themselves being of fireproof construction. London architects, however, nearly always construct these of iron and concrete on the cantilever principle. I have not more than touched in this paper upon the leading features of these regulations; there are many of minor detail which space prevents my mentioning, but although of minor detail they are of great importance as to the prevention of the origin or spread of fire. I have, in conclusion, merely to mention the manner in which these regulations are enforced by the Council. With regard to old theatres, the Council have power to compel structural alterations to be made where they deem it necessary for the prevention of fire and safety of the public. Although old theatres cannot be made to comply exactly with the regulations, the alterations required are generally based upon the principle of these regulations, to make the old premises as nearly up to date as circumstances will allow. With regard to new theatres, plans have to be submitted for the examination of the Council's architects, who report to the committee as to whether the buildings when erected will comply with the regulations. If when finished all the regulations are complied with, then a certificate is issued, and the building, when licensed, is opened to the public. No building, however, is opened till the architect has certified its satisfactory completion in accordance with these regulations. The duties of the Council's architects do not end with the examination and reporting upon plans; they periodically inspect and survey the structure both by day and night, and visit the premises when the public are witnessing the performances, to see that all the exits are free, the safety-lamps alight, the "panic" bolts in working order, and the doors ready to be opened with a push by the public themselves. These inspections are made sometimes unbeknown to the proprietors, the officer mixing with the audience, and paying for admission as one of the public, but at other times the survey is made in company with the manager of the theatre. All defects noted are reported to the Theatres Committee of the Council, who, having considered them, request the manager to remedy them forthwith. There, however, is no regular fire brigade inspection of theatres enforced in London, and the Council feel to a great extent that this is a grave defect; there appear to be difficulties, or want of Parliamentary powers, in the way of providing for the expenses of this inspection, which everyone interested in the safety of the public and the protection of theatres from fire must wish to see promptly swept away.

THE SAFETY OF THEATRE AUDIENCES.*

IT is not my intention to give a lecture, but simply to open a discussion. I shall not read a paper on modern theatre planning, or construction, or fire-watches, or theatre inspection; but shall simply invite discussion on the relative merits of planning, construction, watching, and inspection, as far as the safety of theatre audiences is concerned, with the view of obtaining your opinion as to their order of precedence. The opinion of the Congress, if framed as a formal resolution, would, I am sure, be considered by all authorities intrusted with the safety of places of public amusement, and would greatly facilitate the abolition of some of the anomalies to be found in existing laws or regulations governing such premises. We all know how many serious theatre fires we have had, the loss of life, and the lists of injured. We also know, though perhaps we scarcely realise the frequency, how often there are smaller fires at theatres of which the public, and even the authorities, hear little. I am not going into detail; but just to mention a few figures, let me say that there were no less than 180 fires between 1871 and 1881; since 1881 some 300 more fires have taken place, resulting in a total destruction of the building. These include the great catastrophes at Vienna, Nice, Exeter, and Paris. These figures are from the statistics of the late Herr August Foelsch, which I have the pleasure to continue, and have now so extended as to treat of 1,200 cases of total destruction. As to the smaller fires, I will only note that during the year I served with the Berlin Royal Police Fire Brigade there were a great many fires in the Berlin theatres, and this city is well-equipped with fire-watches during the hours of performance. Now, theatre fires have been almost identical in every country, both as regards the outbreak, spread, and result. Popularly expressed, the fire-fiend has behaved everywhere in the same manner, and, taken as a whole, the kind of resistance offered him when once he appeared on the field has also been very much the same. Theatre fires, as such, are generally too much for the local fire brigade, and if there is any extensive life-saving necessary, the means at the disposal of the authorities are usually quite inadequate to deal with such emergencies. Everywhere the theatre fire has shown us that a combative policy alone would be of no avail. The results everywhere called for an energetic preventive, backed by a moderate combative policy. Now, gentlemen, nearly every country has inaugurated a preventive policy. We have had every kind of legislation conceivable for the protection of the public. There has been hysterical panic legislation; ponderous regulations in which every detail is defined by law; legislation which leaves practically everything at the discretion of an executive of experts; and regulations which are merely so by name, and are a farce because they cannot be enforced. There is no uniformity in this legislation, not even in its elementary principles. If we read the regulations of the different countries consecutively, with an idea of discovering what is really necessary, the result is most confusing. Now I am not going into detail. I shall not quote clauses, &c., but I will say broadly that some countries seem to consider good construction the essence of safety, whilst clear planning, watching, or inspection is forgotten. Other countries give all attention to endless regular inspection, and omit the watching; others, again, require inspections only; others, perhaps, again, good planning, construction, and ample inspection, but no watching. Well, gentlemen, it is time for some representative body of experts to decide what they consider to be in the interests of the public. I am not going to raise any of the many questions as to the proper executive for locally determining or enforcing the requirements; nor am I going to enter into the merits of individual regulations. I am simply going to ask you to determine the main and elementary principles, as the first step towards uniformity. I now propose a resolution pointing out that good clear planning in a theatre is of far greater importance to the audience than clever construction with certain powers of fire resistance, and, further, that the regular attendance of fire-watches day and night, and more especially during the performances, is more essential than any amount of regular, or even surprise, inspection. I will go further and ask you to decide if you do not consider the order of precedence to be—(1) planning, (2) watching, (3) inspection, (4) construction. In proposing the adoption of this resolution, I should wish to point out that I consider it the duty of the authorities to attend to the protection of life in the first place, and to the protection of property in the second. In speaking of property, I consider the protection of adjoining property of greater importance than the theatre "risk" itself. As we all know, how easily panic occurs without any fire, and how dangerous the rush of a frightened audience can be. The clear exit of ample dimensions with the simplest route will be the safest, and perfect symmetry of plan of most value. The prevention of a cause for panic is best guarded against by the constant presence of experienced and responsible firemen, who will, on the one side, see the possibilities of danger and prevent it, and, on the other side, be able to act smartly in case of an outbreak. I do not wish to disparage good construction, or regular and surprise inspections; but I consider the most careful regulations as to construction practically valueless, as far as the safety of the audience is concerned, if the planning is not straightforward, and responsible firemen are not regularly in attendance. Theatres are built under the most varied circumstances, as we have national, court, municipal, subscription, and subsidised theatres, and theatres which are simply commercial enterprises. I do not consider it of such concern for the authorities if the building of a private or public owner will resist fire for a given time as that the public are able to leave the premises easily. Wood stairs will take them quite as quickly into the open as stone ones, and stone stairs with many winds and complicated plan will be far more dangerous than wooden ones of straight flights of, say, 14 steps each. Of course, good construction lessens the risk of an outbreak of fire, and I shall always advocate good construction where unreasonable requirements are not made. My resolution, gentlemen, is owing to my having been over many theatres built according to modern regulations of the best fire-resisting materials, and yet having found them dangerous in the extreme through bad arrangement of staircases and passages, and then on account of my knowing many important cities which, though equipped with modern regulations for the erection and maintenance of theatres, have no powers to enforce the presence of an official fire-watch during the performance, or, for that matter, any fire-watch at all. Your resolution, gentlemen, would, as I said, do much towards facilitating the abolition of such anomalies.

DETAILS OF WINDOWS TO SECOND FLOOR, FARNESE PALACE, ROME.
By Michael Angelo.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XII.—ITALIAN RENAISSANCE—WINDOWS AND EXTERNAL DOORS.

THE changes which gradually took place in the treatment of doors and windows were as strongly marked as any during the Renaissance period. At first the openings were formed with semicircular arched heads in rusticated masonry, the doorways displaying no detail except the chamfering (if it may be so called) of the arris with a large quadrant cavetto, while the windows boasted of simple tracery—a relic of the Gothic influence which at that date pervaded Western and Northern Europe.

This stern simplicity, however, was not retained for long, and even some of the earlier Florentine palaces—such as the Pitti—contain a whole series of examples of windows treated similarly to those in the Caffarelli Palace at Rome (see the Building News for Aug. 23 last), with either pilasters of simple form carrying a deep frieze and pedimental cornice, as on the ground floor, or else an architrave not only across the top, but also returned down the sides of the windows—the "architrave" of the building construction class—with un-ornamented frieze and cornice over that. A further natural and beautiful development of this jamb-architrave was illustrated in the same issue of the Building News in the doorway of Conservatori Palace at Rome, it being bent to give an appearance of strength to the head—a method of treatment afterwards in common use in England. But Michael Angelo did not stop there. The curved pediment had already been introduced, and he adopted it in the windows on the second floor of the Farnese Palace (see Building News for Aug. 30); but in these same windows the jamb-architraves were ornamented with bold carving and lions' heads, and the tympanum was sculptured with bull's skull and wreaths. Here, too, appears a falsity, for the bull's skull carrries what, in pretence, is a key-stone to the bed mouldings of the tympanum. It is the introduction of apparent construction for ornament's sake, and consequently a mistake, sure to lead to worse—and much worse came. Michael Angelo was succeeded by less able men, who sought originality, and found it in contortion and misuse.

---

* All rights reserved.

The Doorway of the Berberini Palace illustrates this, with its clumsy broken pediment, and its keystone carrying a carved head, and this carrying a projection in the bed-mould. The details, too, are coarse, and almost the only pleasing feature is the use of the bee upon the shield, to signify the initial letter of the name of Berberini. More striking, though, is the employment of rusticated blocks across the pilasters, especially as it is a thing which subsequently became common, and undoubtedly gives a forceable appearance; but it is certainly open to criticism, as not arising naturally out of the construction, and as generally being unnecessary to the artistic effect.

The Doorway by Borromini illustrates another type of broken pediment, the break being devised solely for the introduction of a tasteless shield, and being utterly destructive of the beauty of what would otherwise have been a pleasing door. The swelling of the frieze is worth attention here—another uncalled-for fancy, looking as if the weight of the cornice had been too much for it to bear. A slight or moderate swelling may be condoned upon optical grounds, but it is difficult to find excuse for an almost semicircular bulge.

But as an example of utter deterioration, it would be difficult to select a more flagrant case than the Propaganda College by Borromini, where almost every form and detail is distorted. It is only necessary to compare the elevation with those of the Caffarelli and Farnese Palaces, already given, to see what is meant; how the desire for elaboration and excess of ornament and possibly the self-conceit (another and plainer word for want of restraint) of the architect, and his consequent search after the original, have all combined to wreck the design.

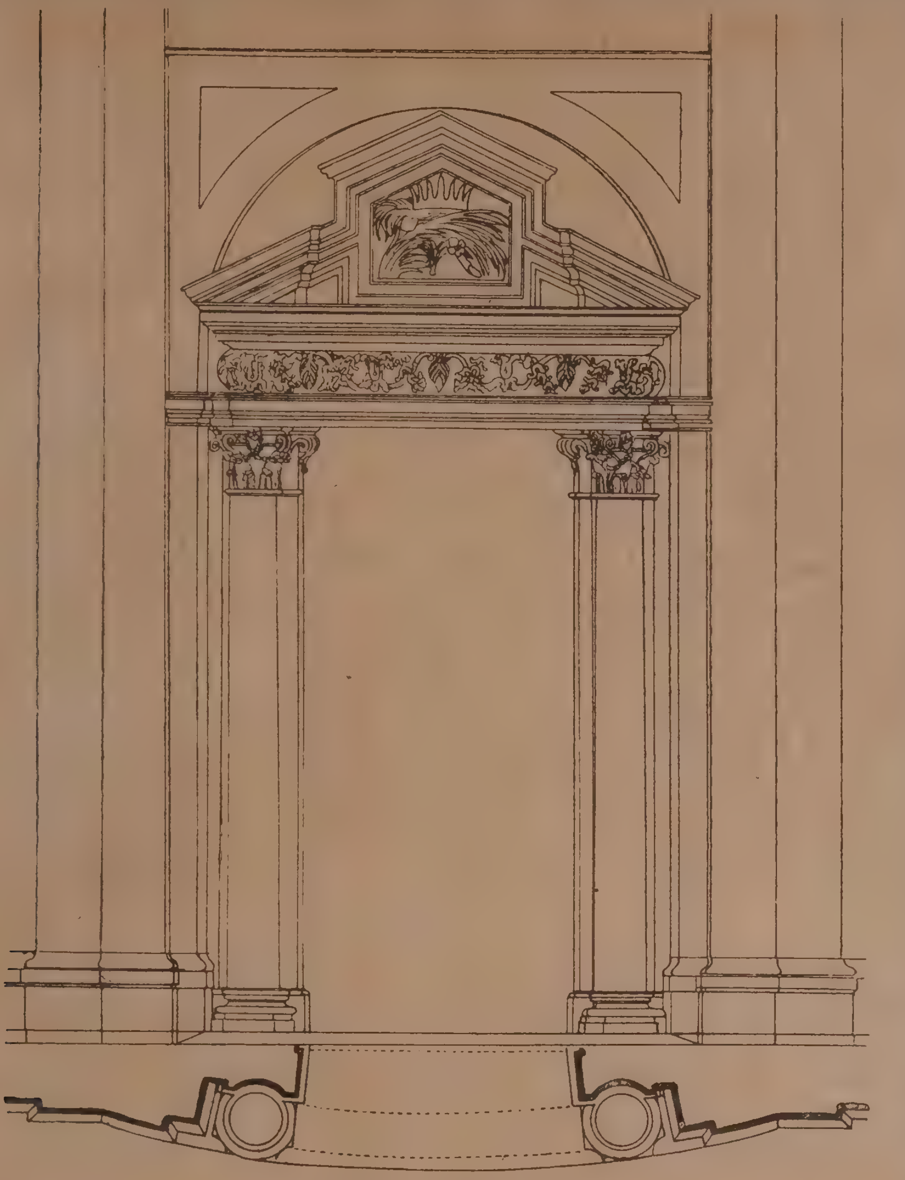
WHY THE MORECAMBE LANDING STAGE FELL.

THE lessons suggested by the evidence given at the adjourned inquest on the victims of the Morecambe Pier "accident" lie upon the surface, and most persons, with the possible exception of the pier directors, will agree with the conclusions arrived at on Monday by the jury, whose verdict was to the effect that the deaths occurred through the collapse of a landing stage owing to the corrosion of a bolt, and that the pier directors showed great negligence in not having the structure periodically examined. The further recommendation by the jury that the Board of Trade should be asked to issue regulations enforcing the periodical inspection of piers seems to be urgently demanded. The inquiry by the coroner why Mr. Worthington had not spoken out as strongly in his report to the directors as he did at the inquest was pertinent; but this did not entirely palliate their neglect of his recommendations.

At the adjourned inquest on Monday, Mr. E. Hill, the manager of the pier company, explained that the eastern stage, the one which collapsed, was built in 1872, four years after the main pier was erected. Colonel Mawson, engineer, of Manchester, designed the extension, which included the stage, and the contractor was Mr. Andrew Thorne, of Barrow-in-Furness. The contract price for the pier extension was £4,550. He reiterated his assertion that the directors, after receiving Mr. Worthington's report (which, as we stated last week, recommended that repairs estimated to cost £5,600 should be carried out forthwith), still considered the landings safe. They had since expended £500, but on painting. Till November last the pier had not been examined since 1880. Mr. John Waugh, C.E., of Bradford, deposed that the western landing-stages were built about 1868-9; and the principle on which they were constructed was sound and good. Each joint of the grid was carried upon a cross-beam resting upon the horizontal principals. Further support was given in the middle by a wrought-iron beam. The grids had flanges at right angles to the floor line, and these were bolted through the cross-beams, producing great rigidity. The eastern landing-stages were made in 1872, and were constructed on a different principle. They were



DOORWAY.—BY BORROMINI.

about as bad as they could be in the matter of construction. The whole of the weight was carried by the bolts—in the case of the grid that gave way by a single bolt, the only one ever put in, in some cases by two. There was only one beam of iron to carry the grids, and that did not rest on any beam, but was slung by the bolt, and that bolt had all the weight of the grids and the people who might be upon it to carry. The plan could not be worse for the purpose of carrying a weight. The money which it had been stated the company paid for the extension carried out in 1872 was sufficient for a thoroughly substantial job to have been made of the work. The cause of the accident was the corrosion of a single bolt. There should certainly be an inspection every three or four years. The end of the pier, added in 1872, was scamped work. The written report of Lieut.-Col. Addison, R.E., of the Board of Trade, stated that the pier was designed in the first instance for erection at Valparaiso. Its length was 898ft., and width (in the clear) 20ft., the former including three square bays where the pier was 40ft. wide. It had a rectangular head 54ft. from back to front, making up the total length of the pier to 952ft. The pierhead was originally 120ft. in length, but it was extended outwards from either end in 1872 to give a frontage of 300ft. He was unable to trace in the records of the Board of Trade any authority for this extension of the pier-head; no plans of the latter were forthcoming. Between the four iron pillars (12in. diameter) of the eastern landing-stage were horizontal timber-beams 8in. wide and 12in. deep, resting on collars on the pillars, and secured by iron straps passing round the pillars; near the top of the inner face of the longitudinal beams an angle-iron was bolted along them, about 3in. wide. In the centre, between the transverse beams, was a rolled-iron beam, 8in. deep, with flanges 5in. in width, and a web about half an inch thick. At the ends of this girder the flanges seemed to have been cut off, to allow the web to be bent outwards, so as to butt against the beams, and the girder was then fixed by two bolts through each wood beam. The iron beam or girder had thus no bearing whatever, but was simply hung on the bolts. The latter were now so worn as to make it difficult to say what was their size originally, but they were probably 1in. bolts. On the top of the iron girder and angle-irons rested iron gratings, each about 6ft. 3in. by 2ft. 4in. wide, covering a space within the pillars of about 14ft. by 12ft. 6in., and which formed the landing-stages. In the case of the stage which gave way, only one bolt, instead of two, had been used to support the ends of the centre girder. This bolt was, practically speaking, eaten away by rust, and could no longer bear the weight. In addition to the defective bolt, the angle-irons above referred to were also in a very decayed and insecure state. Corrosion of the bolts was, therefore, the direct cause of the accident; but the construction of these stages was faulty in the extreme, and nothing short of their entire reconstruction could be at all satisfactory. The old western landing-stages (differently constructed) appeared to be in fair condition; but they and the whole of the pier should be most carefully examined, in order that all defects might be at once made good. In conclusion, Col. Addison observed that, although faulty construction and bad work were apparent, the pier had been sufficiently long in use to show that it could stand the exceptional strains and conditions which affect such a structure, so long as everything remained in good order. The necessity for thorough periodical inspection, in order that defects might be found out in time, could not be too strongly impressed upon all those who were in any way responsible for the maintenance of the pier.

NOTES FROM PARIS.

THE programme of the competition for the proposed new buildings to be erected in the Champs Elysées, in the place of the Palais de l'Industrie, which will be demolished, although under preparation, will not be published for some little time. This competition, a very important and interesting one, will not be opened till November, and will, in all probability, last three months. The final decision of the Chambre regarding the vote of credit for the Exposition of 1900 will first have to be given for the proposed buildings, which, together with the proposed magnificent avenue of the Champs Elysées, will form an important feature in the coming Exposition. The municipal council will also have to accept the terms of the competition before anything can be done. Meanwhile, a number of Parisian architects, who have formed a near opinion of what will be required, are already sketching out their plans and designs in order to be quite ready to proceed rapidly with the preparation of their drawings as soon as the programme is made known.

There exists at this moment a rather strong current of opinion in disfavour of universal exhibitions, a number of well-known men taking up the matter in grave earnest. The municipal council of Nancy has voted to the effect that such expositions at Paris be henceforth suppressed, beginning, if possible, with that of 1900. It is said that the country is looking forward to the next exhibition with feelings of disgust rather than with those of pleasurable anticipation. That the Cairo-street, the buildings of the History of Habitation, and such like, so much frequented during the last Exposition, are nothing more than playthings, estimated, however, much more highly than the Trianon of Marie Antoinette at Versailles, but really unworthy of becoming for more than a year the centre of French genius. Again, the substitution of these playthings for the real beauties of Paris, which take quite a second place, is not the only thing to be condemned: it is the character itself of the town which is distorted and defiled during the whole year. Paris, instead of remaining the capital of intellect and elegance, becomes the centre of prostitution. Besides, the scheme of a universal Exposition does not in any way correspond to any pressing or important want or necessity: it is, on the contrary, a fact that all former exhibitions have been the cause of grievous prejudice to business and trade in the provinces. It may be said that the coming exhibition will enrich Paris, but this would only be for a moment, and at the expense of the provinces; not only that, but it would injure the real interests of the capital by attracting within its walls a multitude of new inhabitants, who as soon as the exhibition was over would find themselves deprived of work and resources, and thus increase the ranks of the poverty-stricken, whilst at the same time all the necessities of life would become much more expensive. The scheme of universal expositions is entirely against that of decentralisation, which is now being strongly advocated in France. Besides all this, the mere idea of the upsetting which the town will have to undergo for the proper preparation of the proposed *fête*, should be sufficient to turn popular opinion against the scheme. A few months ago the mutilation of the Esplanade des Invalides gave rise to much indignation; shortly it will be the turn of the Champs Elysées and the Palais de l'Industrie to undergo similar trials, and who can say if the proposed new palaces and avenues will repay by their beauty and usefulness the upsetting of the present state of things? A certain number of influential members of the Chambre have the intention of voting against the grant of funds for the Exposition of 1900, and may-be they will have strong support from provincial members. The reply of M. Picard, director-general of the coming Exposition, appears sensible enough. He says that the playthings spoken of as being unworthy of Paris are absolute necessities to every exhibition. Human nature is the same all the world over, and attractive or frivolous mere nothings are necessary to induce the mass of people to visit more serious things. How many of those who visited the Machine Gallery and other interesting portions of the last exhibition would have come at all if there had not been close by the Cairo street and the light amusements therein? As regards the opinion that during the year of exhibition the character of Paris will be distorted, the town ceasing to be the centre of intellect and elegance, the idea is simply absurd. During exhibition time congress meetings increase, learned and scientific men from all quarters of the globe take part in these meetings, Paris will become the rendezvous of science and learning. The proposed palaces of art in the Champs Elysées will certainly be a magnificent group of buildings, providing greater and more convenient accommodation for art exhibitions and the various shows which are now held in the Palais de l'Industrie, whilst the new avenue and monumental bridge will be great and attractive improvements to that portion of the town. The opinion that such exhibitions are of great prejudice to the provinces is unworthy of any man of common sense. Very shortly the work of preparation will occupy thousands of workmen come from all parts of France. These will leave their wages, not only in the restaurants, but also amongst the smaller tradesmen of the capital. This money will return to the provinces in payment for corn and food necessary for the maintenance of the city.

In 1889, five million visitors came from the provinces, a million and a half from abroad, leaving over £40,000,000 sterling amongst Parisian tradesmen. Most of this money has since returned to the provinces for employment in various industries. In 1900 the amount of money left in Paris will be more than double that of the last exhibition, and French industry will benefit very largely thereby; in short, such an exhibition is of the greatest utility in forwarding the commerce of the country, and in establishing trade relations between France and foreign countries. That of 1900 will proclaim to the world our desire for peace, and will prove the truth of the above remarks.

The Exposition de Travail, or Work, now being held at the Palais de l'Industrie, is rather disappointing after the great expectations held out that this exhibition would be one of the most interesting. It being still open for another couple of months, it would be invidious to say too much; but the remark might be made that in this age of work, industry, and invention, a much more interesting and attractive series of exhibits might have been brought together, and that even with those now on view—which certainly offer some variety—much more life and vigour, and therefore more interest, might have been given by means of a few machines and apparatus in motion, and a few installations, showing the actual production and manufacture of some of the objects exhibited. The exhibition is a success as far as the musical attractions are concerned, for interesting concerts are given daily; but it is doubtful if, apart from this, the visitors find very much to interest them. The section of building exhibits, although very nicely arranged, unfortunately contains very little of sufficient interest to warrant a description.

The new prisons of Fresnes will shortly be commenced, from the plans of M. Poussin, departmental architect; these prisons are destined to replace, outside Paris, the old prisons of Sainte Pelagie and Grande Roquette in the interior of the town, and which will shortly be pulled down. The prison is planned on entirely new lines, the traditional star-shaped plan being abandoned; for the first time in France also the cell portions of the buildings will be raised to a height of five stories; the lighting will be entirely by means of electricity. The estimated cost is £425,000, this sum being fully covered by the sale of the valuable land occupied by the existing prisons.

The well-known sculptor, Barrias, has just completed the monument to be erected to the memory of Emile Augier; the work is at this moment in the workshop of the metal founder; the inauguration will probably take place in October. The monument consists of the bust of Augier, surmounting a column 14ft. high, and three figures, the first, a standing figure, being that of a woman representing Comedy writing the dedication to Augier, her left hand resting on the shoulder of a seated figure representing Adventure. Behind the column the genius of Comedy is holding the mask of Got. The monument will be placed in the centre of the square close to the Odeon theatre.

Parisians have only just escaped the necessity of drinking the bad-tasting and unhealthy Seine water; in fact, for a few days during the recent hot weather, several of the quarters of the city were supplied with the river water, and if the dry season had continued, by this time the whole town would have been obliged to put up with this unwelcome beverage, or, to avoid doing so, help to swell the fortunes of the mineral water manufacturers. Much discontent is expressed on all sides, that, after spending an immense amount of money for the recent construction of reservoirs and aqueducts for the purpose of supplying all Paris with fresh water, the town is scarcely any better off than before, a few days of hot weather resulting in the scarcity of proper drinking water. The authorities naturally excuse themselves by saying that the Parisians are not economical, and employ the water supplied for drinking purposes for many uses for which ordinary Seine water might be employed; at any rate, not quite a week of the extremely hot weather we have been enduring occasioned the unexpected disappearance of over 9,000,000c.ft. of fresh water, leaving the reservoirs almost dry. A scheme is now before Parliament for the storing and leading to Paris of water from the valleys of Loing and Lunain, and this new supply, it is hoped, will suffice for use under ordinary circumstances. As an example of the evolution brought about by necessity, it may be remarked that the Paris authorities are raising the price of water fit for hydraulic lifts to such an extent, that the hotels and other establishments who employ a large quantity of water for their lifts are abandoning the present system, and installing in its place lifts worked by compressed air or electricity, for the working of which the cheaper Seine water at low pressure may be employed.

A new company is being formed at Paris, entitled, Société des Chambres Mortuaires d'Attente, having for purpose the construction of buildings containing waiting-rooms or mortuaries destined to receive the bodies of persons recently deceased, to all appearance, until the certainty of real death is assured, and all risks of premature and living burial avoided. The first mortuary "hotel" will be constructed at Passy-Paris, near the banks of the Seine. The style of architecture will be very simple, and fitted to the purpose of the building, which will consist of a plan in the form of a parallelogram, crossed by a central passage giving access to the mortuary chambers. It will be composed of a ground floor and cellars. A second passage will cross the former at right angles, this being reserved for the service of the building. The public passage will give access to an ante-room, a room for the body, a salon, a chapel, and a terrace or winter-garden. The building will be paved with mosaic work, and heated by a low-pressure system. The entire lighting will be by electricity. There will be a system of aëration by means of air forced into the various rooms, a proper ventilation being secured through the ceilings. An apparatus Giffard will cool the incoming air in summer-time; it will also be sterilised by passage through asbestos cloth. The building will be surrounded by well-kept flower-gardens, containing the outbuildings for various uses. The aspect of the whole will be one of richness and elegance, with at the same time a befitting severity. In all the arrangements the most scrupulous attention will be paid to sanitation; all angles between walls, ceilings, and floors will be rounded; each ceiling will be pierced with outlets for ventilation in the perforation of one-tenth of the surface; the floors will slope slightly in the direction of properly-siphoned outlets. The cost of the first "hotel" is estimated at £10,000; the inauguration will probably take place in February next. There will be a special service of vehicles for transporting the body from the dwelling to the mortuary, and for carrying it back again "if there is the necessity." A service of doctors will watch the bodies until all uncertainty of real death is put aside. The relations and friends of the deceased, or apparent deceased, will be admitted to watch over and care for the body. As regards the financial side of the undertaking, the tariff fixed by the town is £24, £20, £16, £8, and £4, for from first to fifth classes respectively; taking an average of 360 francs, and supposing that the small proportion of 3,000 bodies are brought to this building per year, the receipts would be a little over a million francs, or £43,000. The expenses are estimated at £14,500, leaving a net profit of £28,500, allowing very good interest to the shareholders; besides, each share of £24 affords the right to the holder of one passage through the hotel—if not for himself, at least to anyone to whom he may sell his right.

The new buildings of the Faculté de Droit, or schools of law, are now being completed as far as concerns the most important portion of the work. They comprise a monumental entrance from the Rue Saint-Jacques, opening into a large waiting-hall, three stories of amphitheatres on the Rue Soufflot, and libraries on the Rue Cujas. The courtyard in the centre forms an immense square, covered with iron and glazed roofing, and destined to form a reading-room. The new façades have several interesting sculptured portions, from the designs of the sculptor Corbel. The old library will not be pulled down, as was first intended: the preservation will therefore adjourn for an indefinite time the research after a number of very interesting Gallo-Roman tombs which are known to be under the ancient portion of the old building.

The proposed work of supplying Paris with drinking water from the valley of the Loing will, it is hoped, be sufficient to avoid the inconvenient surprises from lack of water experienced this summer. The work will not necessarily cost a very large amount of money; but the extra supply of water will be about a million and a half cubic feet per day. Besides, it is the intention of several members of the Chambre to urge the construction of a third reservoir at Saint-Cloud. The land already belonging to the town of Paris, no expropriations will be necessary: the work will, therefore, cost about £60,000 only.

The serious railway accident, which recently happened at the tunnel of Batignolles, near the Saint-Lazare station, calls immediate attention to the question of demolishing the tunnel—an exceeding dangerous feature just at the junction and narrowing of the many lines leading to the station. The work, if undertaken, will be a very costly one, for the tunnel passes under an important boulevard and land occupied by a large number of very important business and dwelling-houses. The cost of expropriation will, therefore, be very considerable, and the work of making open line will quite transform this portion of Batignolles. It is urged, however, that the suppression of this dangerous tunnel should be made as soon as possible.

A very rare occurrence in the annals of Paris streets has just taken place. At Paris the private or semi-private streets not classed amongst the public streets of the town are supposed to be maintained by the various proprietors of the buildings and dwelling-houses in these streets, both as regards the work necessary for the proper supply of domestic and drinking water, and the cleansing and repairing of the road and pavements. A semi-private street, Rue Lagille, Montmartre, having been allowed by its proprietors to reach a state of filthiness and dilapidation far from desirable in a sanitary point of view, the Prefecture of Police issued orders requiring the proprietors to undertake the necessary measures for repairing, cleansing, and properly maintaining the road and drains. The owners having, for a reason of economy or other, refused to do the necessary work, the Prefect was obliged to use his right of condemning the street, and perform the work of barring the entrance by means of a solid barrier of hoarding, having, however, an entrance permitting the exit and entrance of the tenants, the entrance being kept locked, and keys given to each of the proprietors or their concierges. As this imprisonment is scarcely to the taste of the tenants of these houses, it is at present the cause of much difference between tenants and proprietors, and as the proprietors still refuse to do the necessary work ordered by the Prefect, it is probable that this state of affairs will be of long duration, at any rate, until some member of the town council takes the matter in hand. As the barrier has been several times broken down by the tenants of the houses in this street, and as each morning the barrier is replaced by order of the Prefect, at the expense of the proprietors of the street, by the time the dispute is settled it is probable that the expenses will have reached a respectable figure, and will form the basis of an interesting lawsuit.

The inauguration by M. Leygues, Minister of the Interior, of the asylum for old people, installed in the ancient Abbey of Saint Severin, at Château Landon, was the opportunity for an interesting visit to the Abbey and neighbourhood. The monument, which dates from the 12th century, restored by Jacques d'Aubusson in the 15th century, belonged to M. Ouvré, deputé, who has now made a present of it to the department for transformation into an asylum or workhouse. The monastery, which, owing to its position on a high hill, was a veritable citadel, has been arranged for its present use by M. Bulot, departmental architect; the original façade has been restored, and an immense staircase leads from the front of the building to the level below. The asylum contains 144 beds, refectory, and covered promenade; the entire lighting is by electricity. The surrounding grounds have been arranged most carefully and artistically—in fact, everything has been done to soften the few remaining years of the old people who may be fortunate enough to find hospitality in this fine old building, located in one of the most picturesque portions of France. The architect, M. Bulot, has been named Officier de l'Academie.

Paris. ARTHUR VYE PARMINTER.

◆

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—XXIII.

IN connection with the important subject of counterbraces, the next case which presents itself for consideration is represented in Fig. 1,

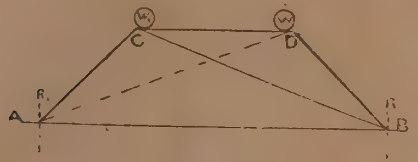


FIG. 1.

in which the example of truss we have selected for analysis is shown loaded with a couple of weights, W and W_1. If we take these weights equal to one another, the conditions will be sufficiently similar, for all practical purposes, to those attending a load uniformly distributed over the upper member of the truss. It will be both interesting and instructive to ascertain how this new disposition of loading affects the different members of the truss, and how the action of one weight completely nullifies, in some portions of the frame, the action of the other. So far as the total resulting stress on each bar (using the word in the sense already explained), they can be readily obtained by drawing to scale the stress diagram in Fig. 2. From this diagram we find that the

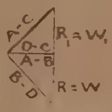

FIG. 2.

stresses upon the bars A C, B D are equal to one another; that the stresses upon A B and C D are also equal to one another; and that the stress upon the diagonal bar C B is equal to zero. It is thus demonstrated that, under three separate conditions of loading, the bar C B is differently affected. These three results should be carefully noted:—

(1) When the weight on supposed concentrated load is situated on the apex to which the diagonal bar is not connected, the bar undergoes a stress of tension.

(2) When the load is situated on the apex to which the diagonal bar is connected, the stress upon it is one of compression.

(3) When two loads of equal intensity are placed one on each apex—that is, when the truss is uniformly loaded—the diagonal bar undergoes a total stress which is equal to zero. This last statement requires some explanation. It is true that the stress diagram in Fig. 2 has no line corresponding to the bar C B in Fig. 1, and, therefore, shows that, as already stated, the *total* resulting load is equal to nothing. But it would be a great error to deduce from this fact that the diagonal bar C B undergoes no stress whatever from the separate action of each weight. It is not the fault of the stress diagram that it does not delineate the individual stresses upon each member of the truss, for these diagrams, like mathematical formulæ and equations, are not intended to give any but the total results. These instances of of the application of stress diagrams to roof-trusses in which the lines of forces cross one another, and the sub-divisions of the lines will represent the separate stresses brought upon some, but not all, of the corresponding bars.

To return to the separate and total stresses upon the diagonal counterbrace C B, it is evident that if we take the action of each weight, W and W_1 in Fig. 1, separately, the case, so far as the determination of the total stresses upon each bar is concerned, becomes a combination of the two examples represented in Figs. 1 and 3 in our last article, in the BUILDING NEWS of September 6. In order to render this important point clear, we must recapitulate a little, which will be facilitated by lettering the three diagrams in the same order. It must be borne in mind that no member can undergo stresses of a different character—that is, tension and compression, at the same time. The total resulting stress will be, therefore, the algebraical sum of the two, and we will represent in the present instance, for the sake of simplicity, stresses of tension by the sign of minus, and those of compression by the sign plus. The following Table, compiled from the stresses given by the stress diagrams in Figs. 2 and 4 in our last article, and in Fig. 2 of the present one, will show how the separate stresses produced upon the bars by the individual action of each weight, when summed up algebraically, will agree with the total stresses resulting from the combined action of the two weights. The slight discrepancies in the second places of the decimals may be disregarded, as they are of no practical importance, and are, moreover, inseparable from the employment of two or more independent diagrams. Although the one counterbrace C B in Fig. 1 is sufficient for the stability of the truss; yet to avoid the unsymmetrical, lop-sided appearance of such a piece of framework, an additional one, A D, shown by the dotted line, is usually employed. If both these bars be made ties—that is, incapable of transmitting any part of the loads W·W_1 to the support the farthest from each load, the total resulting stress upon A D similarly to that on C B will be *nil*. On the other hand, should these bars be made to act as struts, the case becomes similar to that in Fig. 3 of our last article, and the stresses can be determined in a similar manner. It will be found that the upper horizontal bar C D will have no stress upon it; but it is required practically, although it is theoretically redundant, for the truss is indeformable without it, as we have from our general equation—

TABLE 1.

Bars.	W.	W_1	W + W_1
A B	− 0·23	− 0·67	− 0·90
A C	+ 0·34	+ 1·00	+ 1·34
B D	+ 1·40	0·00	+ 1·40
D C	+ 0·94	0·00	+ 0·94
C B	− 0·74	+ 0·73	0·00

$$S = (2A - 3) \text{ and } 5 = (8 - 3) = 5.$$

When a member of an open-web girder or truss is subject, like a counterbrace, to stresses of different character, which are usually opposite in direction, it is said to undergo reversed stresses, or more simply "reversals," concerning which we have some remarks to offer. A clear distinction must be made between the repeated application of a stress, whether it be applied isochronously, or at irregular or un-uniform periods of time, of the same character, and reversed or alternating stresses in acting in opposite directions. Later experiments have fully confirmed the results arrived at by Sir William Fairbairn and other engineers and scientists: that repeated application of a stress of one character, whether tensile or compressive, which is less than the actual or ultimate breaking stress, will fracture the specimen of iron or steel subjected to the crucial ordeal. As an example, it was proved by actual experiment that a built-up riveted girder, after being subject to 315,000 applications of the same weight, was fractured—that is, gave way, although the load was equal to only one-third of that which would have caused its failure had it being gradually imposed, or under conditions similar to those attending the action of a static load. We have, therefore, the general law, that any specimen of iron or steel, and probably of other metallic substances, which have not undergone the experimental *peine forte et dure*, will yield not only to a static load exceeding the ultimate strength of the material, but also to repeated applications of a load very much inferior to the actual statical breaking load. In addition to the proof of this rule, which experiments have conclusively established, they also demonstrated that under similar conditions the breaking load varied with the difference of the ratio existing between the maximum and minimum stresses.

It follows as a corollary of the above statement, that if we know the maximum and minimum stresses to which any specimen of steel or iron may be subjected, and also the statical breaking weight of the same specimen, the actual breaking weight can be calculated. It is necessary, also, to know the maximum stress under which the specimen would yield after several million, or, in fact, after an indefinite number of applications. This last necessary datum has been supplied by experiment, and tables have been published recording it for different materials, and also for the same material under different forms and different conditions of testing. In this instance, it is assumed that the specimen is subject to stresses of only one character, and that there are not any reversals.

Let S represent the stress per square inch, or the unit stress, that would fracture the specimen after several million applications of the load. Put W to represent the statical breaking load of the specimen, and make B equal to the actual breaking load that is required. In the first place, we shall always have—

$$W > S \text{ and } W > B \ldots\ldots\ldots\ldots\ldots (1)$$

Let y = the ratio between the minimum and maximum stresses; then to find the value of B we have the general equation—

$$B = S + (W - S) \times y \ldots\ldots\ldots\ldots (2)$$

from which we obtain—

$$B = S + (yW - yS) \ldots\ldots\ldots\ldots (3)$$

and solving for B we have finally—

$$B = S(1 - y) + y \times W \ldots\ldots\ldots\ldots (4)$$

As a practical example and illustration of the formula, let us take the case of one of the members of a steel bridge which is subjected to a stress of five tons per square inch by the live load as it passes across, and to a stress of one ton due to dead or permanent load. Both these stresses are of the same character, and so far as the calculation is concerned, it is immaterial whether they be tensile or compressive. Practically, there is a difference in the ultimate effect upon a specimen of steel or iron, accordingly as it is acted upon by a stress of tension or compression. This will be alluded to subsequently. From what has been stated, we have the minimum stress equal to one ton, and the maximum equal to six tons, so that for the value of y we have—

$$y = \frac{1}{1 + 5} = \tfrac{1}{6}.$$

Experiments have shown that for steel, under the conditions assumed, we obtain—

$$S = 15, \text{ and } W = 28.$$

Substituting these values in equation (2)—

$$B = 15 + (28 - 15) \times \tfrac{1}{6},$$

and in equation (4)—

$$B = 15\left(1 - \tfrac{1}{6}\right) + \tfrac{1}{6} \times W \ \ldots\ldots\ldots (5)$$

from which we deduce—

$$B = \frac{15 \times 5}{6} + 28 \times \tfrac{1}{6} \ \ldots\ldots\ldots\ldots (6)$$

and, finally—

$$B = 17{\cdot}1\dot{6} \text{ tons.}$$

If we keep all these quantities constant with the exception of y, a proof will be afforded of the second statement that the breaking weight or the value of B varies inversely as the ratio of the limiting stresses. Let the stress upon the member of the girder or truss due to the line load be three tons, and that due to the permanent load one ton, then the corresponding value of y will be—

$$y = \frac{1}{1 + 3} = \tfrac{1}{4}.$$

Making y equal to this fraction in (5), we find—

$$B = 15\left(1 - \tfrac{1}{4}\right) + W \times \tfrac{1}{4},$$

from which B = 18 25 tons.

An important point in connection with the somewhat wide difference which has been shown to prevail between the statical breaking weight of a part of, or of the whole structure, and the breaking weight due to the action of a continually repeated load, is that this difference very seriously affects what is known as the factor of safety. If W be taken to represent the statical breaking load of a girder, truss, or, in fact, of any structure, and U the unit stress, or, as it is usually termed, when applied to metallic structures, the stress per inch of net sectional area, then if F equals the factor of safety, we have always—

$$F = \frac{W}{U}.$$

This factor of safety is usually based on the assumption that the ultimate breaking strength of the structure is the resistance it opposes to a statical or uniformly distributed load. It is obvious, from what has been demonstrated in the present article, that this assumption does not fairly represent the true nature of the actual action which takes place when the loading is not of a statical or uniformly distributed character. In all railway bridges the live or travelling load is the one to be specially provided for, and a factor of safety which would provide amply for the contingencies of a dead or permanent load, might be altogether inadequate to meet the exigencies and requirements of a heavy rolling load. In the example already quoted, the statical breaking weight was assumed to be equal to 28 tons per square inch, and if we put the factor of safety equal to four, the unit stress will be—

$$U = \frac{W}{F} = 7 \text{ tons.}$$

But the actual breaking stress of the material under certain circumstances of loading and impact was found to be only $17{\cdot}\dot{1}6$ tons, so that adopting the same unit stress as in the previous instance, the factor of safety is given by the equation—

$$F = \frac{W}{U} = \frac{17{\cdot}\dot{1}6}{7} = 2{\cdot}45 \text{ tons.}$$

The question of the "fatigue" of iron and steel work, and also the difference between the results of repetitions of stresses of the same character, and of those of opposite characters, or reversals, have to be next considered.

◆

BOOKS RECEIVED.

Gas-Fittings: A Practical Handbook Treating on every Description of Gas-laying and Fitting, by John Black, Second Edition (London: Crosby Lockwood and Son).—The many developments of gas-lighting, and the new burners and incandescent systems, have made it necessary to publish a second edition of this very useful little treatise. The author, amongst other things, points out the merits and demerits of iron and lead services. Iron services, now generally used by the leading gas companies, are more durable, and freer from corrosive influences than lead, especially in damp soils; on the other hand, in "made ground," the lead pipes are best if they are properly protected, so as to resist atmospheric and other influences. Many cautions are given which even gasfitters overlook, as the necessity of laying the pipes with a fall to the main or the meter. If the fall is below the meter, a siphon must be put in. Meter-fixing is often scamped, and the rules given by Mr. Black as to firm and secure fixing, and the connections with main, are important. The chapters on fitting up of small dwelling-houses, workshops, theatres, and other assembly halls, churches and chapels, cooking-stoves, &c., are practical and up to date. A supplementary chapter has been added on recent improvements in burners, the incandescent systems, and other appliances, and descriptions of the Wenham lamp, the "Welsbach," the "Clamond," and other burners will be found. The book is well illustrated.——*The Engineering Magazine* for September contains several articles of interest. One on the "Emancipation of Labour by Machinery," by A. E. Outerbridge, is worth reading, though it must be taken with a grain of salt. The author thinks machinery is destined to become the "missionary of the enlightenment" of the wage-earning class, and he rejects the idea that machinery and competition are instruments in the hands of the capitalist. We cannot here enter into the argument as presented by this writer, who is evidently blind to the evidence that can be brought forward on the other side of the question. The writer thinks the little book, "Merrie England," is calculated to do much harm to the working man in giving him false views of the social problem, and in sowing seeds of discontent. The articles on "Surveying and Mapping a City," by C. H. Rice, and "The Architecture of Modern Hospitals," by E. C. Gardner, are interesting. The latter is profusely illustrated by process blocks.——*Ancient Lights.* The Sheffield Society of Architects and Surveyors have republished as a thin cloth-bound octavo volume, a paper on "Ancient Lights," read before their members in February last by Mr. John Horden, F.R.I.B.A., F.S.I., President of the Manchester Society of Architects. The author traces the history of the acquisition of easements of light, quotes the three salient clauses of the well-known Prescription Act, 2 and 3 William IV. Cap. 71, and gives digests of a few of the leading cases and the decisions therein down to the present time. He observes that judges show no disposition to notice the angle of 45° of light often set up by surveyors, and points out that material damage must be shown to the Court in any action for loss of light, when the Court will deal with the matter on its own merits and irrespective of any particular angle. In all cases where there either is, or it is expected that there will be, an interference with the light to ancient windows, immediate action should, he urges, be taken, or a plea of acquiescence may be successfully set up. As to damages sought for loss of "air," possibly some cases may have occurred; but Mr. Holden says such an instance has never come before him, although 150 such disputes have passed through his hands, and he always strikes out the word "air" from any affidavits with which he has to deal. In conclusion, he points out that a great deal can be done by the exercise of discretion and tact, and it is advisable in most cases to settle the matter if possible without litigation. "If you cannot escape, fight the matter thoroughly; get the best men you can to assist you, and never underrate your opponent."——The *Essex Review* (London: T. Fisher Unwin) contains as its chief features illustrated articles on the churches of Little Dunmow and Little Leigh, respectively by Mr. Alfred Hartley and Mr. Fred. Chancellor; and a third on the Essex Buxtons, by Ewing Ritchie.

◆

CHIPS.

The town council of Leicester accepted on Tuesday a tender for the erection of a technical and art school, at a cost of £24,000, on a site already acquired at an outlay of £10,000.

A commencement was made on Monday with the drainage scheme for the burgh of Denny and Dunipace. It is estimated to cost over £7,000, including the purchase of land on the estate of Denovan, for filtration areas. Messrs. Alexander Stark and Son, of Kilsyth, have the contract.

An organ, built by Messrs. J. Binns and Co., Bramley, Leeds, was dedicated on Thursday in last week at Marholm parish church by the Dean of Peterborough.

Arrangements have been made for a practically free architectural school at the Mark Hopkins Institute in San Francisco. It will be under the direction of Professor B. R. Maybeck, of the University of California. A class in freehand drawing has been organised under H. T. Bestor, another in architectural history under G. H. Sanders, while G. W. Percy will have one in construction. The teachers give their services free. The proposed course will extend over three or four years.

The excavation of the Despina Temple at Lycosura, in Arcadia, has yielded new fragments of the colossal marble statues attributed to the sculptor Damophon, of Messene. These excavations seem to show that Damophon lived later than the fourth century before Christ, the date to which he has hitherto been assigned.

Mr. Robert Harvey, J.P., of Dundridge, near Totnes, visited the studios of Messrs. Harry Hems and Sons, at Exeter, on Friday, to view the life-sized recumbent figure, in white marble, of his eldest son, a boy of ten, who died suddenly at East Grinstead School last May. The remains now lie in the graveyard of St. Andrew's, at Harberton, where Messrs. Harry Hems and Sons are building a marble mausoleum. Mr. W. M. Tollit, of Totnes, is the architect.

At the last meeting of the Llandudno district council, it was reported that the surveyor, Mr. Stephenson, C.E., had submitted to the workmen's dwellings committee plans and estimates for the erection of 19 dwellings on a site near the station, the estimated cost being £4,608 13s. 6d.

George Romney, the painter, was a native of Dalton-in-Furness, and his remains were interred in Dalton Churchyard. Over the grave was laid a native stone bearing the following inscription:—"Georgius Romney, Armiger, Pictor Celeberrimus, Obiit Nov. 15, 1802. Requiescat in pace." This slab had become broken in two and dilapidated, so Mr. J. Orde Romney, a great-grandson of the painter, has commissioned Mr. Miles, sculptor, of Ulverston, to lay down a fitting memorial. The original slab has been preserved and cleaned, and has been let into a solid block of moulded Stainton limestone, veined and polished. Around this, in raised letters, is an additional inscription. The memorial, which measures 6ft. 10in. by 3ft. 10in., stands on a raised limestone plinth, surrounded by an iron railing.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Northern Architectural Association.—On Saturday afternoon the members of this association assembled at Wallsend with a view of inspecting the new buildings and plant at the shipbuilding yards of the firm of Messrs. C. S. Swan and Hunter. Mr. G. B. Hunter explained that the shipbuilding yards occupied an area of about 23 acres, and were divided by Station-road, leading from Wallsend Station to the river, into their east and west yards. It had been agreed with the Wallsend District Council to provide another road outside the yards with a large amount of quay space for the use of the public, and so dispense with the public road between the two shipyards. In each of the yards there were three building slips, capable of building steamers of the largest size, and during the last four years a great many additions had been and were being made, including a new joiner's shop, 184ft. by 80ft.; smiths' shop, 140ft. by 80ft.; fitting shop, electric power house, two additional boilers of the Babcock-Wilcox water-tube type, electric plant consisting of three powerful dynamos, driven by a compound Robey engine, four powerful electric cranes, electric machine motors for outlying machines, and an installation of arc and incandescent lights. The electric installation was on the continuous current system, working at 110 volts, and at present provides for about 200 brake horse-power in addition to the lighting. Space had been provided for doubling the power at an early date. The number of electric cranes would shortly be considerably increased. At present they consist of two revolving travelling cranes working overhead, and capable of travelling the full length of the ships' berths, each capable of lifting three tons and travelling at a speed of 300ft. per minute; one cantilever crane, working on the top of the roof, to lift the same weights at a similar speed, and with a span of 65ft., and one electric jib crane for racking plates up to three tons weight on the ground level. The generating plant and the two first-mentioned cranes and the machine motors are by Messrs. Clarke, Chapman, and Co., Gateshead. The two latter cranes were by Messrs. Thomas Broadbent and Sons, Huddersfield, and were now being tested. The firm had greatly extended their use of hydraulic power, both for riveting, punching, and bending plates, and for lifting the plates at the rolls, countersinks, planing machines, &c. It was intended to hydraulic rivet beam ends, stringer plates and bars, keel plates, intercostal plates, &c., as well as the usual hydraulic frame riveting. Novel features in the yard were the steel sheds, under which it is intended to build steamers of the largest class, and from the roof of which the electric cranes are worked. The new sheds are 68ft. broad, clear of the standards, 80ft. high in the clear, and at present 450ft. long, but are intended to be made 600ft. long as soon as that length is required to deal with the increased lengths of steamships which are now being adopted. The roofs, which will be covered with glass, are supported on steel lattice standards, each consisting of four corner bars, 6in. by 5in., and connected by horizontal and diagonal angle iron. The structure, which has been designed by Mr. F. Caws, F.R.I.B.A., Sunderland, in conjunction with Mr. Hunter and Mr. W. M. Webster, assistant manager, and the staff of the firm, is of a very light character, although it requires about 650 tons of steel for each berth. The concrete foundations of the sheds, together with a system of tram-lines throughout the yard, form excellent roadways for the conveyance of materials with a minimum of labour. It is intended to close in the sides of the sheds with portable screens, which can be left open in hot weather. Later in the afternoon the company were entertained to tea by the firm at the Athenæum Hall, and on the removal of the cloth Mr. William Glover, F.R.I.B.A., moved a vote of thanks to the firm, coupled with the name of Mr. Hunter. Mr. Shewbrooks, F.R.I.B.A., seconded the motion, which was supported by Mr. A. B. Plummer, F.R.I.B.A., hon. secretary to the association. Mr. George B. Hunter acknowledged the vote.

CHELSEA EMBANKMENT COURT.—WROUGHT IRONWORK AND WOODWORK BY MESSRS. JONES AND WILLIS.—PROPOSED MUNICIPAL BUILDINGS AT COVENTRY.

Our Illustrations.

CHELSEA EMBANKMENT COURT.

Under this name a group of twenty-three town houses is in course of construction upon the site on the Chelsea Embankment so well known as the scene of the Naval and Military Exhibitions. The site has a frontage of 237ft. to the Chelsea Embankment, and commands extensive views of the river, while its rear aspect is over the grounds of Gordon House and the incomparable gardens of Chelsea Hospital. With the view of advantageously developing this exceptional site, a new road of irregular crescent form has been made, to which the name Chelsea Embankment Court has been given, and on to which the twenty-three houses, here illustrated, front. All fear of undue formality was removed by the decision to construct a road of irregular form; but, apart from this, a unique character is given to the property by the fact that no one design of a house, either in exterior or interior, is repeated more than a second time. As a matter of fact, among the twenty-three houses thirteen distinct designs have been distributed, while an effort has been made, at the same time, to give cohesion to the entire façade, which extends to 280ft. The whole of the main fronts have been carried out in red bricks and white stone, and the whole of the rear fronts have been carried out in corresponding red bricks, so that the buildings are not simply masked by their principal elevations. The general character of the accommodation is indicated by the plans, of which there are varying types, presenting a uniform attempt to give character and value to the staircases and halls. The buildings were commenced about a year ago, and the entire block will be finished in a few weeks, this rapid achievement being the result of careful organisation by the architect and by the builders. The works, having been commenced before the 1st January of this year, have been carried out under the old Building Act, and the bay window applications in connection therewith are believed to have been the last made under that Act. The property has been built for Mr. W. Bridge, the contractors being Messrs. J. Allen and Sons, of Kilburn, the amount of their contract being £92,000. The chief foreman is Mr. W. J. Otterwell, and the architect Mr. Delissa Joseph, F.R.I.B.A., of 17 and 18, Basinghall-street, E.C.

COATS MEMORIAL CHURCH, PAISLEY.

(See description on p. 446.)

COVENTRY MUNICIPAL BUILDINGS.

In continuation of our illustrations of the design selected by Mr. Chas. Barry, F.S.A., the assessor for the new Municipal Buildings for the Coventry City Council, we give another double sheet of sketches, showing the end elevations to Earl-street and Hay-lane, and the interiors of council-chamber, hall and staircase, and upper floor. We published other illustrations of this design of which Messrs. Harry Quick, of Coventry, and Messrs. Brewill, Baily, and Mallows are the joint architects, in our issues of July 26th and the 6th inst.

Engineering Notes.

North British Railway Extensions.—At the half-yearly meeting of the North British Railway, to be held to-day (Friday) at Edinburgh, the engineers, Messrs. Cunningham, Blyth, and Westlaw, will report that the Banavie branch of the West Highland Railway was opened on June 1st. The new south pier at Methill is completed. On the east pier, out of a total length of 1,000ft., 440ft. have been completed, and a further length of 150ft. has been founded. The contractor is erecting a concrete cofferdam to enable him to construct the new entrance and quay walls. The Garngaber Junction Railway will be ready for opening in a few weeks. The contractors for the Abbeyhill extension continue to make good progress with the new tunnel, near 100 yards being completed. Nearly the whole of the ground required for the extension of Waverley station has now been cleared of buildings, and the brick arching is making fair progress. The small contract for the construction of a new main sewer from Waverley Bridge, under the whole length of the station, is now almost completed. The reconstruction of Waverley Bridge is being carried on as rapidly as possible. Messrs. Simpson and Wilson, engineers, Glasgow, report as to the Charing Cross Station: "We beg to report that the opening up of the tunnel is now completed. Contracts for the waiting-rooms, verandahs, and hoists have been recently entered into." Mr. James Carswell, engineer, Edinburgh, reports that the whole of the works in connection with the widening of the line between Corstorphine Station and the east end of the Mound tunnels at the entrance to Waverley Station were completed, and, after being inspected by the Board of Trade officer, the new lines and tunnels were opened for traffic on 21st July last. Good progress is being made with the carrying out of the works in connection with the Glencraig and Craighead branches. About 44 per cent. of the earth work has been executed, about 40 per cent. of the bridge-work has been completed, and the steelwork for the remainder is in hand. About 70 per cent. of the drains and culverts have been put in, the fencing and gates are practically completed, and half a mile of the permanent way has been laid down and ballasted. The doubling of the Monkland and Kirkintilloch line between Muckcroft and Avenuehead, in connection with the new Garngaber fork, is progressing favourably. The whole of the retaining walls and bridges have been completed, and about a mile and a half of the new line has been laid down.

Spurn Point.—A new lighthouse has just been built at Spurn Point, the sandy peninsula at the mouth of the Humber. It replaces one of brick built in 1776 by John Smeaton, which in turn supplanted a tower erected in 1675. The present structure, which was formally inaugurated on Thursday in last week, occupies a fresh site, and has been erected from designs by Mr. Thomas Matthews, engineer to the Trinity House. The foundations were prepared for by sinking 21 concrete cylinders, each 22ft. in depth and 7ft. in diameter, within a circular area of 1,256·6sq.ft., and 40ft. diameter. The interspaces between these cylinders and the interiors of the cylinders themselves are filled in with concrete of a slightly different texture to that of which the cylinders were made, the latter being somewhat closer and harder. The whole forms a complete mass through which no water can percolate, affording no facilities for the development of extensive cracks or weak places, and resting on a subsoil of gravel. Smeaton's piles were only 9ft. 6in. deep, and did not go below the depth of the sand layer. Upon the foundation of the concrete cylinders the new lighthouse tower has been built of blue vitrified bricks from Staffordshire, over 300,000 of which have been used, and it is 26ft. higher than that of Smeaton. In the basement of the tower provision is made for storing 8,000 gallons of heavy mineral oil, with a flashing-point of 240° Fahr. The tanks are lined with lead to prevent leakage, and the oil is pumped up to the service room at the top of the tower as required. The whole weight of the tower is 3,020 tons, the wall at the base being 5ft. 6in., and at the top 2ft. 9¾in. in thickness. The opportunity has been taken greatly to improve the light to be shown from this station, also to render unnecessary the maintenance of the low lighthouse. A white flash of two seconds' duration is shown every 20 seconds, thus giving three flashes in a minute, the dark interval being 18 seconds. Three subsidiary lights are shown from lower windows in the new tower, one white fixed light of 12,000 candle-power up the Humber, one white fixed light of 8,000 candle-power to show over the Chequer shoal, and one red fixed light of 4,750 candle-power to cover the Sand Huile buoy. The lantern and illuminating apparatus were made by Messrs. Chance Brothers, of Birmingham.

The Galway and Clifden Railway.—This line, the longest and most important undertaking sanctioned under the Light Railways in Ireland Act of 1889, has just been opened for traffic. The total length of the line, which is a single one of 5ft. 3in. gauge, and opens out to tourists Connemara, is 48 miles. It commences with a junction with the Midland and Great Western Railway system at Galway, and terminates at Clifden on the Atlantic coast, with intermediate stations at Moycullen, Oughterard, Maam Crossroads, Recess, and Ballynahinch. Mr. J. H. Ryan, of Dublin, and Mr. Townsend, of Galway, were the joint engineers, and Mr. E. J. Jackson the contractors' engineer.

Wirral and Wrexham Railway.—The last excursion of the half-dozen outings arranged by the Liverpool Engineering Society during the summer took place on Saturday afternoon, when a visit was paid to the Wirral Railway Works. Amongst those present were Mr. A. J. Maginnis (president) and Mr. S. B. Cottrell (vice-president). The new line of the Wirral Railway commences at Leasowe, near Bidston Hill, and here the contractors for the new works, Messrs. Monk and Nowell, Liverpool, had provided a locomotive and a carriage to convey the visitors over the new line, 15 miles in length, and laid with double rails. There will be stations at Upton, Barnston, Neston, and Hawarden Bridge, at which place the Wirral line will join that of the Manchester, Sheffield, and Lincolnshire Company. For almost a mile, between Neston and Hawarden Bridge, the line will run in a deep cutting made through the solid rock. Great difficulty has also been experienced in laying down the road alongside the Dee estuary, in consequence of the marshy condition of the ground. The construction of the line was commenced in October, 1892. Sir Douglas Fox is the chief engineer of the work, Mr. Cooke resident engineer, and Mr. E. S. Wilcox acting engineer. On arrival at Hawarden Bridge the party left the train and proceeded to inspect the swing-bridge, which was opened in August, 1888, and which carries the Manchester, Sheffield, and Lincolnshire Railway over the Dee.

CHIPS.

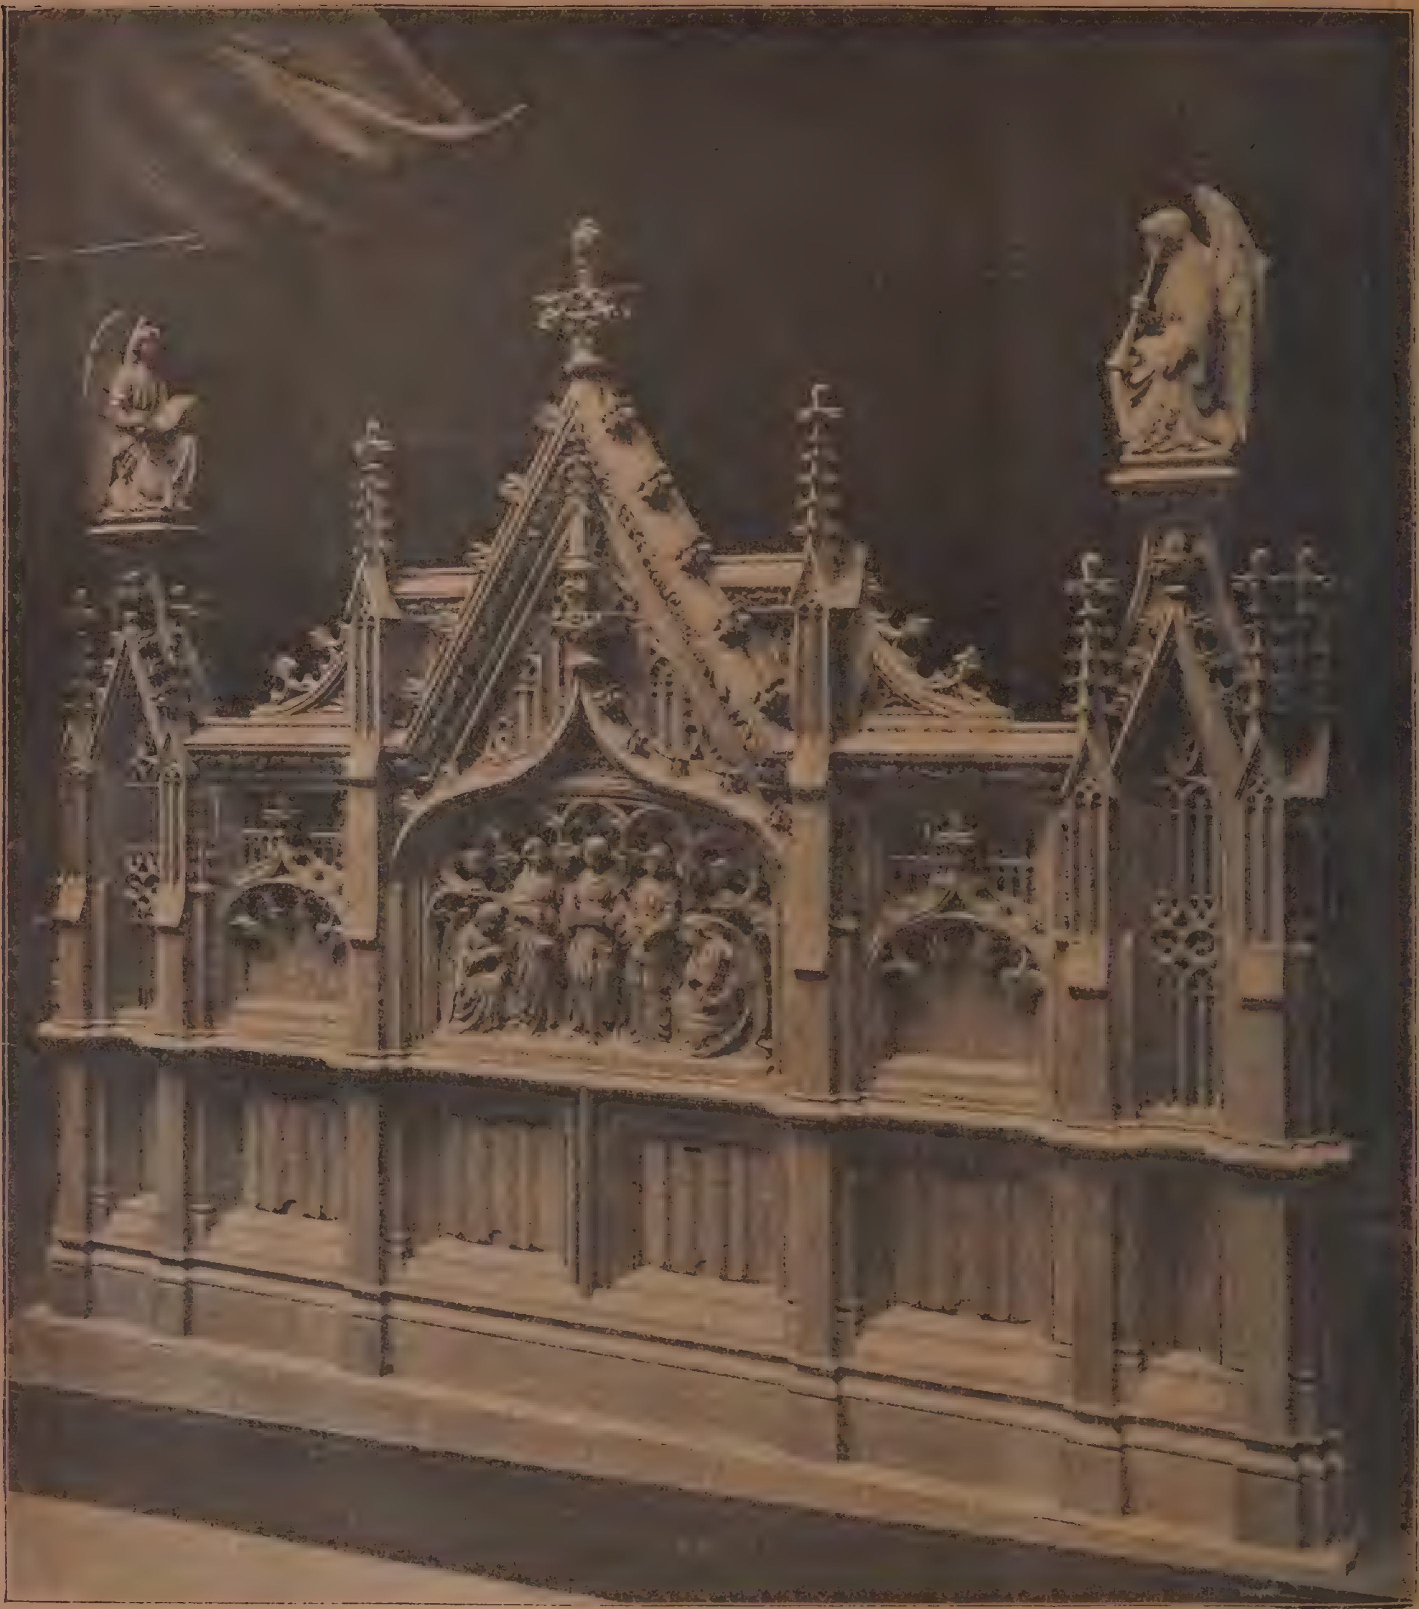
A scheme is on foot to construct a new line between Nottingham and Scarborough. The proposed route is through a great part of the Nottinghamshire coalfields and Retford.

In the case of an application on behalf of Harry Miller, of Brentwood, builder and timber merchant, the order for discharge from bankruptcy has been suspended for two years ending July 15, 1897.

At a meeting of landowners' representatives and farmers, held at Reynoldstone on Monday night, it was unanimously resolved to inaugurate a scheme for the construction of a light railway into the Gower peninsula. The promoters of the scheme propose to utilise the present Oystermouth Railway to Blackpill and the old railway along the Clyne Valley.

The town of Llanrwst will soon possess an additional attraction, a local solicitor having offered to grant to the council Lake Crafnant and its surroundings, comprising in all some 80 acres.

On Saturday last the members of the Bristol Clerks of Works and Builders' Foremen Association concluded a series of excursions by a visit to the quarries of the Bath Stone Firm, situated at Box. On arriving at Box, the party drove to the mouth of the quarries on Box Hill, and were conducted through the mines by Mr. Hancock (manager), assisted by Mr. Jelly. After an examination of the plans and a general explanation as to the discovery and history of the quarry, and the method adopted by the Government surveyors in making surveys, Mr. Hancock conducted the party through the workings. After inspecting the Box Ground stone, a passage was made through the tunnel connecting it to the Corsham side, and there the company ascended.



SCREEN OF ORGAN CONSOLE AT COATS MEMORIAL CHURCH, PAISLEY.

Made by Messrs JONES AND WILLIS.

WROUGHT IRONWORK AND WOODWORK, COATS MEMORIAL CHURCH.

ON our lithographic sheet are shown a wrought-iron gas corona with hammered foliage for the nave and transepts (12 in all), suspended from ornamental projecting brackets with down-rods, enriched with scrolls and lead work; also one of four wrought-iron gas-brackets, with beaten-up foliage (about 5ft. high), fixed to tower columns; one of four copper and wrought-iron lanterns, suspended in vestibule; wrought and copper lantern, fixed to wall of west front to light staircase; wrought-iron and copper lantern, affixed to wall of steps leading to west entrance; and a copper and iron lantern for south entrance.—The Organ is placed on both sides of chancel above the canopied stalls, but is played from a console fixed in centre of chancel, and the photo here reproduced shows the front or screen of console facing west. It is all in oak, Late Decorated in style, with figure-panel representing the Heavenly Choir, and flanking figures typifying Prayer and Praise. The height is about 6ft. 6in., width 7ft. 6in.—All were executed at the works of Messrs. Jones and Willis, of 43, Great Russell-street, London, and Eagle Works, Hornsey, and Birmingham, to the designs of Mr. Hippolyte J. Blanc, A R.S.A., architect.

◆

The city council of Exeter, after a long debate, have decided to purchase for £7,500 the works and plant of the electric lighting company in that city.

The parish church of St. Modwen, Burton-on-Trent, was reopened on Friday after extensive restoration. At one time a scheme was contemplated which involved the extension of the chancel, the construction of choir and clergy vestries, and the reseating of the church in the modern style; but this was found impracticable, and an alternative plan providing for the thorough repair of the fabric was decided upon. This has been carried out at a cost of between £5,000 and £6,000, under the supervision of Mr. J. A. Chatwin, architect, Birmingham; Messrs. Lowe and Sons, Burton, being the contractors. The present edifice dates from 1719; but it is erected on the site of the old abbey church built in 1002, and much of the material of that ancient structure was used in the erection of the St. Modwen's of the present day. To this cause was largely due the unsafe condition of the place.

Building Intelligence.

Birmingham.—The extensions of the Grand Hotel have been for some time in progress, from designs by Messrs. Martin and Chamberlain, of Birmingham. The hotel was in a large degree reconstructed in 1889, and a new block of buildings is being added fronting Barwick-street, including basement and sub-basement of ten stories. Two stories have also been added to about half the range of buildings fronting Church-street; new offices have been constructed in Colmore-row, and two extra billiard-rooms under the front shops. A ballroom, 100ft. by 52ft., and 32ft. in height, occupies the principal portion of the ground floor of the new block, and is approached by vestibules opening from above the centre of the hotel corridor. The ceiling has 40ft. clear span from side to side, without supporting pillars, and above it there are seven stories of brick and stone work. For the purpose of bearing this weight, there have been arranged over the ballroom a series of five steel truss girders, with queen-posts, rising to the height of the story immediately above—13ft. They are built into five of the dividing walls of this story, while a central corridor runs transversely between the queen-posts. Steel upright girders are also used in the piers of the ballroom, as not being subject to the crushing effect to which simple masonry would have been exposed. The permanent decoration of the ballroom has been carried out by Mr. William Norton, of Corporation-street, Birmingham, in mouldings of fibrous plaster, in the style of Louis XVI. These are coloured ivory-white relieved with gold, while the panels of the ceiling are painted with aërial effects and figures of cupids. In the lower portions of the piers Devonshire marbles are used, and the room is entered from its adjoining drawing-rooms, of corresponding style, by a pair of mahogany doors. There are similar doors between the drawing-room and vestibule. At the lower end of the hall is a musicians' gallery, with a projecting screen of hammered brass and copper; the latter is the work of Messrs. T. Brawn and Co. There is also a crimson brocatelle curtain for dividing the room into two if required. Four hundred persons may be seated at dinner-tables, and at least double that number accommodated at a public meeting. In the basement there are two artesian wells, boiler-house, electric-light generating house, and steam laundry; there is also a range of stockrooms. At the top of the building is a tank, having a capacity of 21,762 gallons, and to which water is pumped from the wells. The new block contains eighty-nine new visitors' rooms, including six private sitting-rooms. In addition to the lift, it has four through staircases for visitors from floor to roof, including one which is external to the building. The extension will cost from £60,000 to £70,000, bringing up the sum which has been spent on the structure to about £100,000. The building contractors are Messrs. John Barnsley and Son, and Mr. James Lucas is the clerk of the works.

East Layton.—The formal dedication of the new mission church erected by Mrs. Proud, of East Layton Hall, took place on Sept. 19th. The building occupies a site on the ridge of Layton Hill, and Mr. J. P. Pritchett, of Darlington, is the architect. Mr. Dodds, of Gilling, has been the mason and clerk of works; Mr. Harwood, of Manfield, the joiner; Mr. Hedley, of Barnard Castle, plumber and glazier; Mr. Wandless, of Darlington, slater. Mr. Ebner, of London, supplied the marble mosaics for the floor; Messrs. Hart, Peard, and Co., Birmingham, ironwork; and Messrs. Richardson and Co., Darlington, heating apparatus. The stone used was from the Forcett freestone quarry, which lies within two miles of the church, and the roof covering is of brown Welsh tiles. The plan is cruciform, with buttressed walls and square tower. The style is Late Tudor, with mouldings and other details in the style of King's College Chapel, Cambridge. The east gable end contains a five-light window, and the west a four-light window. The transept gable ends contain each a pair of two-light windows. The nave is divided into four bays, each containing a three-light window, and the chancel has three bays, each containing a two-light window. All the windows have moulded jambs, arches, mullions, and tracery, and the doorways are deeply moulded to correspond, all with bosses left for future carving at the label terminations. Internally, the walls are lined with finely-dressed stone, the windows and doors having small pillars in the moulded jambs. The four piers and arches of the tower are also deeply moulded, but all the capitals, corbels, and label terminations are at present left rough for future carving. The roofs are of oak, on the curved brace principle, with moulded principals and purlins forming panels with boarding between them. The doors are also of oak, panelled with tracery on the inside, and having wrought-iron hinges on the external boarding. The windows are glazed with clear glass having coloured border. The floors of seats are of oak blocks, and the passages and chancel are floored with marble mosaic. The upper part of the pulpit is of wainscot oak, moulded, and carried on a moulded stone base and shaft. The font is also of stone. The stalls of the chancel, the nave, the prayer desk, and reredos, and screen to north transept (forming vestry) are all of wainscot oak, moulded and carved. The altar-table is of oak. The front is divided into three panels, with buttresses marking the divisions. The table is covered with a super-frontal of crimson velvet.

Great Easton.—The Bishop of Peterborough visited Great Easton on Wednesday week, and formally reopened the parish church, which has just undergone much-needed restoration. The church is Early English in style, consisting of a chancel, nave, and aisles, with a tower at the west end, surmounted by a spire, in all 90ft. high. The church was reseated in 1838, and affords accommodation for 320 worshippers. The work of restoration has been carried out by Mr. John Thompson, of Peterborough, without an architect. The principal feature of the restoration has been the reroofing of the church. Practically, the whole of the roof, internal and external, is new, with the exception of the heavier timbers, all of which remain. The lead outside, the oak planks inside, and the deal between, are all new. Some of the clerestory windows, which were considerably out of perpendicular, have been taken out and replaced in their proper position. All the old and crumbling stone in the edifice has been replaced, and the church has been repointed throughout. Two lights in the porch have been opened out. The four pinnacles of the tower have been removed, two of them having been blown down in the great gale on Sunday, March 24 last. One of the pinnacles has been blown down no fewer than three times, and, as the others were considered unsafe, it was decided to remove them. These pinnacles were added when the tower was restored and the spire was rebuilt about 30 years ago.

Jarrow-on-Tyne.—St. Mark's Church, erected at the corner of Dee-terrace and Salem-street, Jarrow, was opened on Saturday. The new church, like its parent stem, is situated in the poorest part of the town, and has cost £2,500. It accommodates, including choir, 300 persons, the nave seating 276 and the chancel 24. The nave and chancel are divided by a four-centred arch in stone. The vestries, on the north side, comprise a room on the ground floor for the choir, with a clergy vestry over. The organ chamber is on the south side of the chancel. The style of architecture is Late Gothic, the doors and windows being of simple character and detail, grouped to obtain effect. The chimney-stack and bell-turret are combined for a similar purpose. The materials employed are Hebburn stone, the roofs, which are of open timber, being covered with green Westmoreland slates. The heating is by hot water on the low-pressure system, fitted by Messrs. Walker and Son, of Newcastle. The general contractor is Mr. Stewart Craig, of Jarrow. The whole work has been carried out from the designs and under the superintendence of Messrs. Armstrong and Knowles, Grainger-street West, Newcastle. The church for the present will be seated with chairs; the altar, of carved oak, is by Messrs. Hancock, St. Germans, Cornwall.

Langside, Glasgow.—The memorial-stone of the new Langside Free Church, Glasgow, was laid on Saturday by the Earl of Moray. The site of the church is the spot where the Regent Moray drew up his army at the battle of Langside, and upon it lately stood the picturesque building known as Queen Mary Cottage. Planned by Mr. Alexander Skirling, I.A., the new building, which will cost £10,000, will be Græco-Roman in character, with modern adaptations. The main entrance from Battle-place has a massive doorway divided into three compartments by pilasters and imposts, over which is a moulded cornice with dentil course and antifixæ. Surmounting the main entrance is a portico of the Ionic order, composed of six columns supporting an entablature and pediment, simplicity being the main feature throughout. On either side are circular staircases leading to the galleries. The sittings of the church, which is arranged as a nave and aisles, are planned on the amphitheatre principle, the pews radiating from a centre and the floor sloped all round. Behind the pulpit platform is an organ recess, while accommodation is provided for the choir in front of the pulpit platform, which will be inclosed with a trellis-wood railing. In the basement are the kitchen and heating chamber, while on the same level with the church floor are a suite of rooms, comprising the vestry, session-house, ladies' parlour, and a large class-room. At the south side access is obtained to a hall above accommodating 350 persons. The church is planned to provide 1,000 sittings.

Newcastle-on-Tyne.—The Burt Memorial Hall in Northumberland-road, the headquarters of the Northumberland Miners' Association, was formally opened the other day. The building comprises two floors, and occupies a site 117ft. by 53ft. Externally, the walls are faced with red Leicestershire bricks, with stone dressings from Brunton and Dunhouse Quarries, and part dressings of terracotta. The roof is covered with green Westmoreland slates. The chief front has an oriel window, entirely of stone, and is completed by a gable, on the summit of which stands a miner in stone, taken from Mr. Ralph Hedley's picture, "Going Home." In the centre of the gable are the county arms. On each side of the oriel is a niche, and these recesses will some day be filled by statues of members of the Association. The principal entrance, which is approached by a flight of steps, leads to a wide corridor running the length of the main building, and off this are the waiting-room, offices for president, secretary, and treasurer, stores, &c. In the centre of the corridor is the staircase-hall, inclosed with an oak screen; the staircase to the upper floor is entirely of oak. On the upper floor is the hall for the delegate meetings, 48ft. by 26ft., and lofty. There is an oak dado round the room, and above the walls are divided by pilasters in plaster; the ceiling is coved, and constructed of Minnesota yellow pine. The seating in the hall is fixed, and entirely of oak, the seats and backs being covered with green morocco. There is a raised dais at one end for the president and officials. The glazing to the oriel window is leaded glass, and six panels have medallions with symbolic designs. Specially designed electroliers have been made in wrought iron for the hall. An ante-room adjoins, fitted up in oak. On this floor there is also a committee-room and a library, a museum of past mining appliances being located in the latter room. The remainder of the buildings comprise residences for the secretary and treasurer. The general heating is by steam; but, in addition, there are fireplaces to all the rooms except the hall. The mantels are of Doulton faïence, all of different tints. The general contractor has been Mr. S. B. Burton; the plumbing is by Mr. Stephen Percy; the slating by Mr. John Hewitson; the plastering throughout is in adamant; the window casements and heating apparatus by Messrs. Ashwell and Nesbit; the painting by Mr. John Gibson; the terracotta faïence and sanitary fittings by Messrs. Doulton and Co.; the carving of the figure by Mr. Canavan (of Mr. Robert Beall's carving works); the special fittings and furnishings by Messrs. Robson and Sons. The architect is Mr. John W. Dyson, of Newcastle, and Mr. Councillor W. Flynn, of Gateshead, has acted as the clerk of works.

A new post-office in Branch-road, Armley, Leeds, was formally opened on Tuesday. Mr. C. F. Wilkinson, of Leeds, is the architect.

The Countess of Derby opened, on Monday, the new homes for the blind of North and North-East Lancashire, at Fulwood, near Preston. The building is situated on a slight eminence just outside Preston, on the Garstang-road, and has been erected at a cost of about £8,000. It is built of Accrington pressed brick, faced with stone, and is certified for 52 scholars (an equal number of each sex). On the ground floor are classrooms, lavatory, committee-room, and the matron's quarters. The dormitories on the second floor each contain 13 beds, and between the dormitories is the teachers' room. There is a workroom for skip and basket-making, &c., and where the adult blind will work and receive instruction.

COMPETITIONS.

Machynlleth.—The district council of Machynlleth have awarded the premium of £40 for the best scheme of water supply for the town to Messrs. Kirkby, of Newport, Mon., who have also been appointed engineers for the construction of the works at a remuneration of 5 per cent. on the total outlay.

Shoreditch.—Competitive plans were sent in last Wednesday for new baths and washhouses, with a public library and museum attached, to be erected on an extensive site in the parish of St. Leonard, Shoreditch, having a frontage of 146ft. in Pitfield-street, with return fronts in Bowling Green-walk and Coronet-street. To the rear a space is reserved towards Hoxton-square for an electric light station. The area to be covered by the new buildings is somewhat impeded by some old houses left standing on the south side of the land, leaving ancient lights to be provided for. The sizes stipulated for the library are almost too large to be conveniently contrived with advantage on the space allotted by the Commissioners for the extent of the building—viz., 5,850ft. super. The area for the baths is 28 014ft. super. The cost for the whole is about £40,000. Minute particulars are stipulated for by the conditions requiring details of the steam-pipes and engineering work on the plans. The perspective is to be drawn from a given point and angle to the same scale as the geometric elevations—viz., ⅛in. to the foot, and a ½in. scale detail of the façade is insisted on. It is provided that the library and museum may be chosen from one design and the baths and washhouses from another. No architect is allowed to send in more than one design, and that without any alternatives. Premiums of £125, £75, and £50 are offered, and all the prize drawings to become the property of the promoters. Mr. Rowland Plumbe, F.R I.B.A., is the referee appointed to assist the commissioners in arriving at their award.

West Ham Technical Institute Competition.—The Technical Instruction Committee of the Council of the county borough of West Ham received the following report from Mr. J. MacVicar Anderson, F.R.I.B.A., with regard to the designs submitted in the above competition:—

6, Stratton-street, W.,
August 6th, 1895.

To the Council of the County Borough of West Ham.

Gentlemen,—Having very carefully examined each one of the 73 sets of designs that have been submitted in competition for the Technical Institute and Public Library which it is proposed to erect on the site in Romford-road, known as The Green, I beg to report that, having regard to (a) the conditions of the competition; (b) the by-laws of the borough, which, by the conditions, had to be complied with; (c) the general merit in design, more particularly excellence of plan, to which the attention of competitors was specially directed; (d) the adaptability of the designs for the intended purpose of the buildings, I award the first place to the design marked No. 34, the second place to the design marked No. 51, the third place to the design marked No. 22.

I have the honour to be, Gentlemen,
Your obedient servant,
(Signed) J. MacVicar Anderson.

The authors of the designs were found to be:—

No. 34.—Messrs. J. S. Gibson, A.R.I.B.A., and S. B. Russell, A.R.I.B.A., 11, Gray's Inn-square, W.C.

No. 51.—Messrs. Clark and Hutchinson, 28, John-street, Bedford-row, W.C.

No. 22.—Mr. Thomas Davison, A.R.I.B.A., 11, Oakley-crescent, Chelsea, S.W.

The council have, in accordance with the conditions of the competition, awarded the premiums of £250, £150, and £100 respectively to the three designs above named.

Mr. J. Passmore Edwards will open the art gallery which he has presented to Newlyn on the 14th or 16th of October. The building was illustrated in our issue of the 8th February last. Mr. James Hicks, M.S.A., of Redruth, is the architect, and Messrs. John Symonds and Son, of Blackwater, are the contractors.

A new Wesleyan church, erected in Argyle-street, Hull, was opened on Friday. The building, designed to seat 950 persons, comprises ground floor and gallery, with recessed organ-chamber. It is of brick, with stone and terracotta dressings. A new organ has been placed in the church, having two complete manuals, with a total of 876 pipes. The cost of the organ is £400, whilst the building itself cost about £3,200.

The memorial-stones of a new Congregational church, which is being built at Llangynog, were laid last week. The architect of the new chapel is Mr. T. Rees, A R.I.B.A., Birkenhead; the contractor is Mr. D. Mason, of Llansantffraid. The site is that of an old Wesleyan chapel, on the banks of the Tanat, and the chapel is designed to accommodate 150 persons.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—E. S.—F. R. Blantyre.—J. P. and Co.—F. G.—Dauntless.—Sam. Flowers.—S. W.

Correspondence.

HALF-CROWNS FOR COMPETITION PARTICULARS.

To the Editor of the Building News.

Sir,—On the 14th I wrote to Mr. E. L. R. Jones, asking for instructions and other particulars of the County Intermediate Schools, Welshpool, as advertised in the "B. N." of the 6th, and in reply got a postcard. I replied to that by letter, which, together with the postal order for 2s. 6d., I received this morning, returned without a word. Is it not time such behaviour on the part of public bodies was exposed and protested against.—I am, &c.?

John Henry Williams.

15, Foregate-street, Worcester, Sept. 24.

DISASTER ON BOARD S.S. "IONA."

Sir,—Will you permit us, through the medium of your columns, briefly to draw attention to a method whereby such frightful disasters as occurred on the s.s. *Iona* may be greatly limited or altogether averted? The risk of fires in saloons or state rooms could be greatly minimised, if not eliminated, if the partitions and ceilings were covered with asbestos "Salamander" embossed decorations, which are absolutely non-inflammable, and capable of being coloured to taste to any extent. In the case of lamp and store-rooms, where decorations are not required, ignition of woodwork could be readily prevented by lining the walls and ceilings with asbestos millboard, or constructing same entirely of specially-prepared asbestos plates composed chiefly of fibrous asbestos, so indurated as to be suitable for partitions or ceilings, and requiring scantling only to support them in position.

The advantage which may be confidently claimed for the use of these articles on board ship would be, that in case of fire in any cabin protected in the way described, there would be little, if any, risk of it spreading beyond the point at which it commenced, and in this way the danger would be enormously reduced and the fire much more easily extinguished.

Allow us to add that the same suggestions are equally applicable to buildings, particularly to warehouses, stores, factories, and workshops, where the contents render the chances of fire great.—We are, &c.,

The United Asbestos Co., Ltd.

A CORRECTION.

Sir,—I notice in the list of tenders in your last week's issue that the amounts for the works to Nos. 27 and 29, Moorgate-street, are printed as hundreds instead of thousands, the lowest tender being £2,420. Would you be good enough to have this rectified, and oblige?—I am, &c.,

Howard Chatfeild Clarke.

63, Bishopsgate-street Within, London, E.C.
Sept. 24.

CHIPS.

Messrs. J. A. Lumley and Co., auctioneers and land and estate agents, of 35, St. James's-street, have removed next door to Lumley House, 34, St. James's-street, S.W.

The Mersey Docks and Harbour Board decided, on Friday, to carry out several improvements, including the paving of the surface of the quay lying between the Canada 100ft. Lock and the river wall at the north end of the Canada Dock, at an estimated cost of £3,600, and an increase to the width of the passage between the Hornby and Alexandra Docks, and also the removal and rebuilding of a group of residences on the east side of the passage, at a total estimated cost of £25,200.

By the Queen's wish, the room in Kensington Palace where Her Majesty was born, and which was closed for years, has been specially done up this year so as to present the exact appearance as it did in 1819. The gold and brass work of the room, although much worn, is still in a fair state of preservation.

Professor Victor Rydberg, the Swedish writer and archæologist, died on Saturday, aged 67 years. He was a member of the Swedish Riksdag from 1870 to 1872, and in 1876 was charged by the municipal authorities of Gothenburg to inaugurate the philosophical and historical conferences which were subsequently held annually.

A special service was held on Friday in connection with the restoration of St. Chad's Church, Lichfield, though the whole of the work contemplated has not yet been carried out. The alterations include the removal of the pulpit from the north side of the nave to the south, the removal of several of the high pews, and the placing of the new organ in a fresh position at the east end of the north aisle. The other works contemplated are the taking up of the present floor, and relaying it with asphalte, and the reseating of the whole of the church. The organ has been built by Messrs. Nicholson and Lord, Walsall.

The foundation-stones of the new wings of the Knaresborough National Schools were laid in the Castle Grounds on Thursday. The extensions, now in the course of erection, consist of a boys' class-room, a girls' class-room, and another for infants. £1,200 will be the cost of the new buildings, which are being erected from plans by Mr. J. G. Brown, architect.

George Beck, a Dalston plumber, has been committed for trial on the charge of being the cause of the manslaughter of William Wythe, builder, of Brownlow-road, near Dalston.

The new infirmary wards for the Derby Union, Derby, have been warmed and ventilated by means of Shorland's patent Manchester grates, exhaust roof ventilators, and inlet tubes, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Newhaven guardians have decided to carry out the following new works:—A porter's lodge, female tramps' workroom, eight cells and bath for female tramps, disinfecting chamber and heating apparatus for male tramps, stone-pounding shed with apparatus and yard with high wall, board-room (30ft. by 20ft., with committee-room), waiting-room, lavatory, and cloakroom.

Mr. Charles Truscott Farley, builder, died at his residence, Lemon-street, Truro, on Sunday, at the advanced age of 87 years. Mr. Farley was for over 50 years connected with the building trade, and was the builder and owner of Farley-terrace; and for many years acted as sub-agent under the Carclew estate. He was for long a useful member of Truro Town Council.

Intercommunication.

QUESTIONS.

[11431.]—**Mosaic Pavement.**—We are in a difficulty with regard to a mosaic pavement we have recently supplied, and we thought possibly some of the experts on your staff might be able to help us. The facts are these:—The floor is supported on iron joists which have in some places a span of 25ft. This floor certainly springs and vibrates as it is walked upon, and if two or three people walk together across it the vibration is very marked. The trouble is that the ½in. tesseræ, of which the floor is composed, are coming loose with the traffic. The cement does not seem to adhere to them, although the sides are quite rough, forming a good key. The cement used is White's, and excepting between the joints seems hard enough. One of the best tile-fixers in the trade did the work, who has done any amount of mosaic fixing before. The tesseræ themselves are the same that we always use. In fact, there seems great difficulty in saying exactly where the trouble is. It has been suggested that the vibration of the floor is the cause, and our object in writing to you is to ask if you can inform us whether anything of the kind has ever come under your notice. We have been told that an article appeared in your paper, or one of your contemporaries, calling attention to the fact that mosaic pavements are unsatisfactory on iron girder floors. Any help you can give us we shall be most grateful to you for. This floor is a very nice one of 200 to 300 yards, and although we are paid for the supplying of material, and are as far as that is concerned, all right, our customer who laid it has naturally applied to us to help him.—O.

[11432.]—**Mythology.**—Will some reader kindly give the name of a good work on outlines of ancient mythology? Winged lions, griffins, &c.—A. G.

REPLIES.

[11424.]—**Sub-Contracts.**—I should think that all contractors would have some understanding in writing, otherwise a contract would not exist, and the work would be paid for as executed, the same as priced work.—H. L.

[11425.]—**Moment of Inertia.**—The moment of inertia of a rectangular beam, whose breadth $= b$, and depth $= d$, is $\frac{b \, . \, d^3}{12}$. Also, if $M =$ moment of resistance of beam, $I =$ moment of inertia of beam, $p =$ maximum intensity of stress allowed in fibres, and $y =$ distance from neutral axis of the fibres bearing the greatest stress, then it can be proved mathematically that $M = I \times \frac{p}{y}$. In the present case, $p = S$, and $y = \frac{d}{2}$. Hence, by substituting these values, we obtain $M = \frac{b \, . \, d^3}{12} \times S \times \frac{2}{d} = \frac{1}{6} S \, . \, b \, . \, d^2$.—H. BUSBRIDGE.

[11426.]—**Met. Act.—Public Buildings.**—Schools in the City, or in any part of the County of London, must be in accordance with the London Building Act, 1894. If "J. D." wishes for an answer to any particular question, I will answer him.—H. LOVEGROVE.

[11427.]—**Concrete Floor.**—There should be some stouter T-irons about every 4ft., and the concrete should be at least 6in. thick.—H. L.

[11430.]—**Estates.**—Difficult to answer without knowing size of estate. Generally charge fair price to client for laying out, and about ½ per cent. to builders for supervision.—H. L.

◆

Among the works about to be carried out by the Great Western Railway Company within the next few months are the widening of another section of the Cornwall Railway, that between Redruth Junction and Camborne, a distance of 2¾ miles; the reconstruction in steel braced girders, and other steel work, of the Coldrennick Viaduct, in the same county; and the building of a new passenger station at Llangonayd, Glamorganshire.

The Arborfield Paper Mills, near Helpston, are being provided with a fresh supply of water, a spring having been discovered in the yard at the rear of the premises. Mr. J. Stears, of West Holme, Hessle, near Hull, was the water engineer, and the boring operations were placed in the hands of Mr. J. E. Noble, builder and contractor, of Bourne. At the depth of 69ft. the main spring was tapped, the volume of water being estimated at 8,000 gallons per hour.

Mr. J. G. Body, F.S.I., of the firm of Body and Sons, estate agents and valuers, Plymouth, acted as umpire in the case of North and North against the corporation of Launceston, in which damages were claimed for abstracting water out of the leat, loss of water to mines, and pipe easement. Mr. Davey, of Stokeclimsland, acted as arbitrator for the claimants, and Mr. F. Ward, F.S.I., of the firm of Ward and Chowen, represented the corporation. Evidence having been tendered on both sides, the works were inspected, and the umpire will forward his report in due course.

Very little business was done at the London Auction Mart last week, the total amount of the sales having been only £11,597. In the provinces, except at farming sales, things have been especially quiet; but on Wednesday and Thursday in last week, at the public sale of property and land belonging to the Corporation of Liverpool, the aggregate amount realised was only £5,560, few transactions having been effected.

Legal.

POWERS OF TENANTS FOR LIFE.

THE Settled Land Act, 1882, has done a great deal of good by freeing land for various purposes, and by enabling improvements in building and otherwise to be made, which without its aid would have been impossible. But although a tenant for life is now enabled to do many things, he must still have regard for the interests of those who are to come after him under the will or settlement. By section 53 of the Act of 1882, this is well expressed by providing that a tenant for life shall in exercising any power given him by statute have regard for the interests of all parties under the settlement, and shall in relation thereto be deemed to be in the position and to have the duties and liabilities of a trustee for those parties. By making him so far a trustee, the freedom of a tenant for life is at once considerably curtailed, and he is brought within the rules of equity applicable to trustees. The principle at the base of all these rules is that the benefit of the beneficiaries must always come first, and must guide every action of the trustee.

In the recent case of "*In re* Earl Somers, deceased" (*Times*, August 2), the point at issue was whether Lady Henry Somerset, the tenant for life, could refuse to renew the lease of a licensed house, the White Hart Hotel, Reigate, because she had conscientious objections to encouraging the liquor traffic. It was not denied that the hotel had been carried on properly for years past, nor was it disputed that if not used as a public-house the value of the premises would be greatly reduced. The only arguments of the tenant for life were really her own private opinions and convictions that there are too many licensed houses in England, and also in this locality. Mr. Justice Chitty laid it down that, although the decisions upon the Act did not compel a tenant for life to regard nothing but the pecuniary interests of those entitled under the settlement, still it had never been held that he had any right to act upon his own private views in exercising the powers given him by the Act, nor was there any ground for saying that in so doing he might have regard to the interests of the public generally. So in this case he decided that the tenant for life would be abusing her power and breaking her practical trust if she were to refuse to renew the lease of these premises as a licensed house, and so damage the value of the property of those who would come after her, and he made a declaration preventing this from being done.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

SMOKE.—WALL.—CHIMNEY.—ADJOINING OWNER.—1. If this were a party-wall, the usual notices should be served as to rebuilding; but if it is not, as I understand, the owner's consent to underpin should be asked. If he refuses, the building and soil must be so shored up, or underpinned if that is the only way, to prevent damage to his property. 2. It would be necessary to raise the chimney-stack beyond the new wall.

ROADWAY. — SEWERS. — PLOTS. — LIABILITY. — The making of roads upon a new estate is generally and properly provided for in the various conveyances of the land. Without such covenants from adjoining owners they would not be liable to contribute towards the cost of a road made by one private owner. The same rule would apply to the sewers. There should be a deed arranging these matters.

◆

The Hunslet board of guardians have decided to erect children's homes apart from the workhouse. The estimate of the architect is £7,970, as follows: Two houses, 20 inmates, £1,100 each, both £2,200; three houses, 14 inmates, £950 each, three £2,850; outbuildings, £500; workshops and conveniences, £220; boundary walls, £290; roads and walks, £130; laying out and planting, £115; total, with contingencies, £7,970.

In connection with the scheme of harbour improvement at Wick, the harbour trustees are negotiating with the Public Works Commissioners for a loan of £16,000 to enable them to complete the work of re-walling and deepening the inner basin of the harbour and other works. Tenders for the various works proposed to be carried out have been submitted to the loan board, who have instructed Sir A. M. Rendel to examine and report on the various proposals and tenders, and for this purpose he has visited Wick with Mr. Barry, C.E., Aberdeen, the trustees' engineer.

LEGAL INTELLIGENCE.

WHAT ARE "BONA FIDE" CONTRACTORS.—DELICATE QUESTIONS AT LANCASTER.—At Lancaster Town Council meeting on Wednesday, September 25, there came up for confirmation, or otherwise, the letting of certain contracts in connection with extensions at the sanatorium. One of the contracts, that for mason's work, amounting to £465 17s., or more than half the whole of the contracts, had been let to Mr. Thomas Kitchen, a son of Alderman Kitchen, a prominent member of the corporation, and an ex-mayor. Both father and son are engaged in the building trade under the same "style." Ald. Bell said as there was considerable talk about the matter outside, he would like to know if the whole of the contractors for the new sanatorium were men in business, paying rates, and qualified to carry out work of that sort. The town clerk said he did not know anything of the contractors beyond their names. Ald. Bell asked if the sub-committee, who considered contracts, could say whether all to whom contracts were recommended to be let were *bonâ fidè* tradespeople trading in Lancaster. Ald. Towers (chairman of the committee in question) said the question raised was present to the minds of the sub-committee. They felt themselves in some difficulty, and rather than take upon themselves the responsibility in the matter, they refused to pass the tender, and left it to the general committee. The general committee therefore made the recommendation. The general committee took some pains to assure themselves on the points raised by Ald. Bell, and they did assure themselves before making the recommendation. The matter dropped.

ANCIENT LIGHTS IN LIVERPOOL.—Before his Honour F. W. Taylor, at Liverpool, last week Mrs. Willis, mantle-maker, 40, Bold-street, applied for an injunction to restrain Messrs. Evans, Sons, and Co., wholesale druggists, Hanover-street, from erecting a warehouse in Wood-street so as to injure certain lights of the plaintiff's premises at the rear of her place of business. Evidence was given on behalf of the plaintiff to show that the erection of the present building in Wood-street had considerably diminished the light formerly obtained through the windows, thereby rendering the conduct of the business much more difficult, especially with regard to the discrimination of colours in materials. On the other side, sworn testimony was produced from Messrs. Clark and Wainwright, surveyors, and others, stating that no interference with ancient lights of a serious nature was consequent upon the erection of the new premises in question. His Honour said he was not prepared to grant the injunction, but would order the motion to stand over till the trial of the action.

◆

CHIPS.

The congregation of Free John Knox Church, Aberdeen, have decided to erect a new church on the site of the present building in Gerrard-street. The adopted plan is by Mr. G. W. Moir, and the cost will be £4,500.

A new school of science, art, and technology, which has been erected by the Dover Corporation at a cost of £10,000, was opened on Friday. It adjoins the municipal buildings, and is lighted throughout by electricity.

The big bronze bell, christened "La Savoyarde," which has been cast for the Church of the Sacred Heart at Montmartre, is completed. It weighs 18 tons, or six more than the *bourdon* of Notre Dame.

The employés of the engineers' department of the Birmingham Corporation Waterworks have just made a presentation to Mr. J. W. Gray, the late engineer of the waterworks, on his retirement after many years' service with the old waterworks company, and afterwards with the corporation.

At the last meeting of Glasgow Town Council attention was called to a proposal of the Improvement Trust to erect houses for the working classes upon a piece of ground belonging to the corporation in the Calton district. A report by the city engineer stated that the proposal was to provide accommodation for twenty-four houses of one apartment, and seventy-six houses of two apartments of various sizes—the single-apartment houses rented at £6, and the others, according to situation, at rents of £8, £9, and £10 respectively. After a long discussion the proposal was approved by 53 votes to 7.

Hawkhead Asylum, Crookston, which has been erected by Govan District Lunacy Board, was formally inspected and opened on Friday. The building, which is in the Scottish Baronial style, has been erected at a cost of over £150,000, and will accommodate about 450 patients, but future extensions will enable the number to be increased to 760. Four of the blocks of buildings have been completed and sanctioned by the Board of Lunacy. Mr. Malcolm Stark, jun., of St. Vincent-street, Glasgow, is the architect, and the contractors for masonry were Messrs. A. Muir and Son, Eglinton-street, Glasgow.

STATUES, MEMORIALS, &c.

The late Mr. Ewan Christian.—A monument of simple design and recumbent in form, has just been placed over the grave of the late Mr. Ewan Christian in Hampstead Cemetery. It is executed in red granite, by Mr. Forsyth, and bears the following inscription: "In reverent and loving memory of Ewan Christian, architect. Sept. 20, 1814; Feb. 21, 1895." "With good will doing service as to the Lord, and not to man, that I may win Christ, and be found in Him, not having mine own righteousness, but that which is through the faith of Christ."

CHIPS.

The new technical school in Broad-street, Stamford, was formally opened on Thursday in last week.

The Church of All Saints, Margaret-street, W., was reopened on Sunday, after restoration and redecoration under the direction of its architect, Mr. William Butterfield, F.S.A. The works, including improvements to the organ and the introduction of the electric light, have cost nearly £3,000.

The Bishop of Peterborough, last week, dedicated the new chancel of the parish church of Coalville, Leicestershire. Besides the new chancel, an organ, a pulpit, choir stalls, altar and fittings, new pavements, &c., have been provided, and also a memorial window of stained glass has been placed in the south aisle.

The trustees of the Borough Market are now pulling down some old houses at the west end of St. Saviour's, Southwark. In the course of the demolition there have been exposed some enormous cellars, a large portion of a massive rubble wall built of chalk, flints, and old bricks, and many beams of oak, fir, and chestnut, which must at one time have formed part of old Winchester Palace, the residence of the Bishops of Winchester. This grand old mansion was built by William Giffard in the 12th century, and was surrounded by a park of some 60 acres.

The Whitton Park Estate, near Hounslow and Twickenham, was submitted to auction in plots, on Wednesday. There was a keen competition, and 33 lots were sold, realising a total of £1,780, being at the rate of £650 per acre.

The church of St. John the Evangelist, Broad-court, Drury-lane, was reopened on Sunday, after being closed for eight months for alterations and repairs. The work was undertaken on account of the almost ruinous state of the roof and walls. An entirely new roof has been put to the church, the galleries have been removed, and arcades have been erected, dividing the interior into nave and aisles. The arcades are carried on massive stone columns. Besides these structural alterations, the decoration of the church has been thoroughly renovated. The work has cost £1,850.

The death is announced, at the age of 69, of Mr. R. F. Abrahams, for upwards of a quarter of a century Art Director at the manufactory of Messrs. W. T. Copeland and Sons, of Stoke-on-Trent.

The inquiry which has been directed by the Local Government Board respecting the deficiency of the water supply by the East London Waterworks Company will be held by Colonel Ducat, R E, and Dr. F. W. Barry, at the Town Hall, Hackney, on Tuesday next, at 11 o'clock.

Besides the public library which Mr. J. Passmore Edwards has offered to build for the parish of St. George-the-Martyr, Southwark, he is about to build a public library for Liskeard, Cornwall; and will also provide a public library for Edmonton, which will be associated with the memory of Charles Lamb, who lived and died there. Mr. Maurice B. Adams, F.R.I.B.A., has prepared the designs for this work. Mr. Passmore Edwards is also building a cottage hospital at Tilbury, Essex, for the benefit of sailors and workmen employed in the docks. Mr. Rowland Plumbe, F.R.I.B.A., is the architect.

The town council of Edinburgh adopted, on Tuesday, a recommendation by the Public Health Committee that Colinton Mains Farm, 131 acres in extent, be purchased for £20,500, as a site for a new fever hospital. During the discussion on the proposal, a member asked how it was that, after the doctors had condemned the Craiglockhart site on account of the fogs which were prevalent there, they now approved of the Colinton Mains site, which was immediately adjoining? Mr. Waterston replied, he had put the same question in the Public Health Committee, and the doctor said he had changed his mind. The committee had a hearty laugh, and passed the site. The town council, after this explanation, followed their example.

The presentation portrait of Mr. George Armitstead was unveiled in the Victoria Art Galleries on Tuesday. Mr. Armitstead was member for the city 1868-73 and 1880-83. The portrait, which is a three-quarter length life-size, has been on exhibition at the Royal Academy, and was painted by Mr. A. S. Cope.

WATER SUPPLY AND SANITARY MATTERS.

Ashton-under-Lyne. — Messrs. Kinnell and Murphy, C.E., of Manchester and Bolton, have been called in by the Ashton-under-Lyne District Council to design for them a scheme of main drainage and works for the purification of their sewage, as they have been threatened with prosecution by the Joint Rivers Committee for river pollution. The works will be of a rather extensive character, owing to the great length of sewerage works required, and also the treatment of the sewage at several outfalls.

Leicester Waterworks Extension. — The members of the town council paid an official visit of inspection recently to the works which are now in progress at Swithland and Hall Gates in connection with the water supply of the town. The party proceeded to Cropstone, where the new engine-house, engines, and filter-beds were seen. About two-thirds of the contract for all works are finished. A new service reservoir at Hall Gates is being proceeded with simultaneously with the other portion of the scheme, whilst the additional works at Cropstone are practically completed. Mr. J. B. Everard, C.E., is the engineer-in-chief, and Messrs. John Aird and Sons, of London, are the contractors. There have been constructed upon the works, used in connection with the undertaking, nine miles of tramways, 4ft. 8½in. gauge, and upon these the contractors have had running eight locomotives. There have also been seven portable engines, six steam cranes, four complete sets of stone-breaking machinery, eight steam pumps, three steam rock drills, two mortar drills, four clay pug mills, together with steam-roller and boilers, two complete sets of steam machinery for stone working, and the usual plant for carpenters, smiths, fitters, and cement testing, with waggons, carts, cranes, offices, &c. The number of men now engaged upon the Swithland reservoir alone is over a thousand. With regard to the permanent works, the diversion of the road from Swithland village, and the new bridge which carries it over the reservoir, have been completed and opened for public traffic; and the two dams for maintaining the level of the water above Brazil Island are also finished. Messrs. Aird and Sons have also carried the section of the M S. and L. Railway over this part of the reservoir. This consists of two viaducts of brick arches and girders, and two bridges for carrying the occupation road round the reservoir. The main part of the work, however, has been carried on about three-quarters of a mile below Brazil Island, at the place where the sod was cut in July last year. Here there has been sunk a trench upwards of 600 yards long, and attaining a maximum depth of 70ft., for cutting off the water-bearing strata below the surface of the ground. This trench has been filled with cement concrete, to form a level line at an average depth of about 20ft. below the original surface, and upon this concrete wall is now being erected the puddle-wall, which forms the water-tight centre of the main embankment. This main embankment, with its puddle centre, has now been raised to a height of about 18ft. above the lowest part of the valley. The foundations of the waste weir are being put in, and also those of the bridge going over the bye-wash. The permanent tunnel underneath the main bank has been completed, and the six filter-beds and the clear-water tank in the centre of them are all in progress, two of the filter-beds being nearly completed. The main chimney-shaft is completed, the engine and boiler-houses are well in hand, and the manager's house is also in progress, while the house at the entrance lodge has the roof on. The greater part of the diversion of the road from Kinchley Hill over the main embankment is also finished. The pipes, valves, girders, roofs, and other ironwork are being supplied by Messrs. J. Blakeborough and Sons, of Brighouse, Yorkshire. The engines are being constructed by Messrs. Easton, Anderson, and Goolden, of Erith, Kent, and these will pump the water to the Hall Gates reservoir, which is being constructed, and nearly the whole of the pipes for conveying the water there are laid. This reservoir is also being carried out by Messrs. J. Aird and Sons, according to Mr. Everard's designs, and is in a forward state. This reservoir, when completed, will hold two million gallons, and is at such a height that it will supply the higher district of Leicester and the Oadby reservoir by gravitation, so as to avoid the secondary pumping which now takes place at Charnwood-street. An independent main will be carried through from the Hall Gates to the Oadby reservoir, and thus avoid putting additional pressure upon the old low-level service mains, but connections will be made so that this water can be used at Gilroes or at New Parks reservoirs if necessary. Considerable additions have been made at Cropstone Pumping Station. A new triple expansion vertical marine type pumping engine has been erected here by Messrs. Easton, Anderson, and Goolden, capable of pumping a million gallons in twelve hours either to the Hall Gates reservoir or to the Gilroes or New Parks reservoirs, as may be required; and two new steel Lancashire boilers have been put in by Mr. Edwin Danks, of Oldbury, near Birmingham, for supplying the steam to the new engine. For accommodating this new machinery, an engiue-house and workshops have been erected by Messrs. J. E. Johnson and Sons, of Leicester, while four additional filter-beds have been constructed by Messrs. Bentley, of this town. Mr. F. Griffith, the waterworks engineer, has had the supervision of the new filter-beds, and Mr. Everard is responsible for the designing and construction of the whole of the rest of the undertaking. Messrs. Aird and Sons are represented at Swithland by Mr. Gilbert, their principal agent, and at the Hall Gates reservoir Mr. Pearse is in charge of the work on their behalf. Mr. Daniels is the resident engineer representing Mr. Everard, who, however, is personally superintending the carrying out of his plans.

Wolverhampton.—The General Purposes Committee of the Wolverhampton Corporation had under consideration on Monday an important report, which had been prepared by Mr. J. W. Bradley, the borough engineer and surveyor, with regard to the proposed abandonment of the present pail system, which for a long time has been pretty generally condemned, in favour of the water-carriage system of dealing with the sewage of the town. The report commences by stating that only in four or five towns where the pan system is in operation in the United Kingdom is a continuance of it advocated. Many years ago leading sanitarians had spoken strongly against the system, and the only one to be adopted in its place was by means of water carriage. Houses must be drained and streets sewered, and if those drains and sewers were well and properly constructed no additional expense need be incurred to transmit the entire volume from the houses. The movable pan and the dry conservancy systems cause a greater nuisance, as being more costly than water carriage, and, Mr. Bradley adds, the borough sewage works at the Barnhurst are well equipped and in thorough working order, and perfectly and easily capable of dealing with the whole of the material at a very small increase on the present working cost. With regard to the adoption of the slop-water closets, Mr. Bradley stated that they are for purely outdoor use, but they have the great advantage that in the greatest frost they are not liable to be rendered useless. During the severe winter of 1894-5 in 5,000 slop-water closets then under supervision in his department at Nelson, Lancashire, he never heard of a single instance where the frost had any effect. There were no plumbing repairs needed, there was less liability to get out of order, and the first cost was small, while there was much less sewage to be treated at the outfall. At present there were 13,500 pans in the borough, and if the corporation were to contribute, say, £2 per pan for their conversion to closets, the cost would be £27,000, to which would have to be added £800 for payment of additional inspectors during four years of conversion, and £1,390 for general contingencies, making a total of £29,190. If £30,000 were borrowed for this purpose at 3 per cent., repayable in 20 years, the annual payment would be £2,016, to which would have to be added £660 for extra cost of tipping ashes, inspection, and cost of treating sludge. The total cost would be £2,676, thereby effecting a saving to the town annually of £844, whilst at the end of 20 years, when the amount borrowed had been repaid, the comparison in favour of the slop-water system would be infinitely more favourable. The committee, after a long discussion, decided to recommend the town council to go to Parliament to obtain powers to borrow the money necessary to adopt the water-carriage system.

◆

The interior of Trinity Congregational Church, Peterborough, is undergoing repairs, and alterations and extensions are being made to the pulpit and choir stalls. Mr. John Thompson, of Peterborough, is carrying out the works.

The Linslade Rural District Council have called in Mr. H. Bertram Nichols, C.E., of Birmingham, to inspect the parish of Cheddington, and report upon the best means of sewerage and sewage disposal.

The Jewish Synagogue in Mary Arches-street, Exeter, has been erected just over a century and a half, and in 1844—the centenary of its erection—was restored. Seven years ago, however, the devotions ceased, owing to the paucity of members of the faith in the city. Recently a congregation was again formed, and another restoration of the building was celebrated the other day The work has been carried out by Mr. Selley, builder, of St. Thomas, under the superintendence of Mr. J. Archibald Lucas, and has cost about £120. The carved oak lectern, which served as a rostrum, was supplied by Messrs. Harry Hems and Sons.

A monument, commemorating the victory achieved by Peter the Great over Charles XII. of Sweden at Poltawa in 1709, was unveiled at that place on Monday, with great ceremony.

STAINED GLASS.

Wrexham.—On Friday last, the 41st anniversary of the Battle of the Alma, the stained-glass window which has been placed in the tower of Wrexham parish church by the officers and men of the Royal Welsh Fusiliers, at a cost of about £600, was publicly unveiled and dedicated. The window is of large proportions, and of 15th-century style. It is divided into five long lights up to the springing of its arch, above which the smaller tracery lights are in three tiers, and number ten in their sub-divisions. In the upper part of the lower lights are full-size figures of St. Deiniol of Bangor, St. Michael, St. David of Wales, Edward the Black Prince, and St. Giles. Beneath these, in relation to the figures above are subsidiary subjects illustrative of the meeting of St. Deiniol and St. Augustine; St. Michael, with his warrior angels; the preaching of St. David; the Black Prince at the Battle of Poictiers; St. Giles with the hind seeking refuge with the saint from the royal hunters. All the lights are canopied. In the tracery openings are introduced 24 smaller figures of saints especially connected with Wales—viz., SS. Joseph of Arimathæa, Aristobulus, Claudia, Beatus, Timotheus, Phagan, Emerita, Lucius, Illutus, Amphibalus, Alban, Silin, Kentigern, Helena, Germanus, Samson, Theodoric, Gildas, Beuno, Winifred, Decumanus, Ithwara, Elerius, Sidwella. At the apex of the window is represented the badge of the regiment. At the base of all, in gold mosaic, runs a dedicatory inscription.

CHIPS.

The urban district council of Tavistock have, with the approval of the Directors of Convict Prisons, adopted an amended scheme by Mr. G. Bellamy, C.E., of Plymouth, for the sewerage of Princetown. The works in connection with Dartmoor Prison will be carried out by convict labour.

Mr. C. Low Green, road surveyor to the Swindon rural district council, has been elected to a similar appointment at Croydon, at a salary of £300 a year.

William Thomas Singleton, of Manchester, described as an architect, surrendered to bail at Stockport, on Friday, upon a charge of obtaining £50 by false pretences from Richard Livesley, Stockport. The prosecutor said Singleton came to his office on April 10, saying he had been asked by a client to get a loan of £50 to complete the balance of deposit on twenty-seven houses at Denton. Livesley advanced the money, and alleges that he has since found that some of the representations the prisoner made were false. The case was remanded, and on Tuesday prisoner was committed for trial.

A destructive fire broke out early on Monday morning at 52b, Richmond-road, Shepherd's Bush, W., on the premises of Mr. F. E. Rice, builder, and resulted in the total destruction of the workshops and damage to the stock in the yard.

At Hebburn Colliery, on Saturday, a United Free Methodist chapel was opened for worship. It is built of brick, seats 300 persons, and cost under £1,000.

The foundation stone of the academy about to be built for the Dumfries School Board, was laid with Masonic honours on Saturday. The building, which will cost £12,000, is being erected in the grounds of the existing academy. Mr. Frank Carruthers, of Dumfries and Lockerbie, is the architect; Messrs. Houston and Robinson are the contractors for masonry, and Mr. M'Lachlan has taken the contract for joinery.

A new Wesleyan chapel was opened at Sidcup, Kent, on Friday. It has been built at a cost of £4,000, from designs by Mr. Charles Bell, F.R.I.B.A., of Salters' Hall-court, E.C.

The present schools used by the Tanfield School Board at Causey being inadequate to fulfil the requirements of the Education Department, the Board have decided to erect a new block of schools, and have accepted the plans of Messrs. Davidson and Bendle, architects, of Newcastle and South Shields, submitted in competition.

On Saturday a new Liberal Club was opened at Blackley, in the Prestwich division. The members of the club have purchased premises formerly occupied by the Methodist Free Church congregation in Blackley, who have now erected new buildings. The cost of the new club thus taken over will be about £1,100.

Mr. J. Lavender, the senior partner in the firm of Messrs. Lavender and Son, builders, Dawley, Salop, died last week at an advanced age.

Mr. W. M. Rossetti has offered two family portraits to the Trustees of the National Portrait Gallery, who have accepted the works. One is a portrait of Christina Georgina Rossetti, along with her mother, Frances M. L. Rossetti, head and shoulders, life-size, executed in tinted crayons by Dante G. Rossetti in 1877 at Hunter's Forestall, near Herne Bay. The other is a life-sized bust portrait of John William Polidori, M.D., brother of Mrs. Frances Rossetti; he died in 1821.

Our Office Table.

One of the most familiar landmarks in the valley which divides the New Town from the Old Town of Edinburgh is about to disappear for ever. We refer to the chimney of the gasworks, rising to a height of 329ft. from the ground, which has indeed formed for the past half-century the most conspicuous feature of the skyline when looking eastwards from Princes-street. The shaft is doomed because it is not only between 4ft. and 5ft. out of plumb, but from the fact that the masonry is disintegrating in places, so that its state is pronounced to be so dangerous that it might not stand another twelve months. In its place the engineer to the Gas Commissioners proposes to erect a chimney only 160ft. in height, on a site some little distance to the eastward, about half-way, in fact, between the present structure and Tolbooth Wynd. The Dean of Guild Court for Edinburgh, having a praiseworthy regard for the amenities of their picturesque city, have for the present referred the plans back, so that the site of the new shaft may be moved still further south, and thus be backed from most points of view by Salisbury Craigs, in lieu of cutting the skyline.

A start is apparently about to be made with the work of construction of the Central London Railway. This is the electric road which is to be run under the streets from Liverpool-street to Shepherd's Bush. The capital of the company was successfully issued two or three months ago, and plans will shortly be laid before the City Commissioners of Sewers for the construction of the Mansion House subway in connection with the Bank of England station of the Central London line. This subway will have entrances from back-ends of Princes-street, Poultry, Queen Victoria-street, Walbrook, Lombard-street, Cornhill, and Threadneedle-street. The subway will enable pedestrians to cross from one side of the space to the other, free from traffic, and will afford an entrance to the lifts which take passengers down to the railway station 50ft. or so deeper in the earth. The Waterloo and City Railway, now in course of construction, will also have access to the subway. The Central London Company are also acquiring property for their various stations along the route.

A report, illustrated by a map, as to the effect of the opening of the Tower Bridge on the City traffic has just been presented to the Streets Committee of the City Commissioners of Sewers by their engineer, Mr. David J. Ross. The Tower Bridge has now been opened more than twelve months, and the broad results, so far as traffic is concerned, is that London Bridge has been relieved of about 5,200 vehicles per diem, Eastcheap of 2,200, and Fenchurch-street of about 3,000 vehicles daily; whereas the traffic of Minories has increased by 2,200 vehicles, Liverpool-street by 900, Houndsditch by 700, and Bishopsgate-street Within by 600 vehicles daily. The traffic in the centre and western parts of the City has not apparently been affected by the opening of the bridge.

During some repairs to the choir of the cathedral at Angers, the coffins of King Réné, father of Margaret of Anjou, and his wife, Isabelle of Lorraine, have been brought to light. A vault was accidentally discovered beneath the pavement, and on being explored in the presence of M. Dussauze, the Inspector of Diocesan Edifices, the Bishop, and other officials, it was found to contain two coffins, one in lead and the other in tin. The wood that formerly encased them had been eaten into by dry rot, and had fallen away. In the leaden coffin, which was much the larger, was found a skeleton with a crown of very thin gold leaf on the skull. A sceptre—that of Naples—lay at the right side, and an orb surmounted by a cross on the breast. They were all green with rust. After the inspection, the vault was sealed, and a report of the circumstance drawn up and signed by those present. According to the archives of the cathedral, the Duke and Duchess of Anjou-Lorraine, King and Queen of Naples, were buried in the chancel of the church of Angers. In 1445, King Réné gave his daughter, Margaret, in marriage to Henry VI. of England, whereby he obtained the restoration of his territories of Anjou and Maine, then in the possession of England.

The Docks Committee of the Bristol Town Council have drawn up a report recommending the adoption of improvements, estimated to cost £124,000 in net capital expenditure. The contemplated works include a timber wharf between the Albion Dock and Underfall Yard, connecting it with the Harbour Railway, whilst a relief railway line is to be carried from the Harbour Railway, down Coronation-road, and connecting with the Portishead line by means of a swing bridge, which will also provide a roadway and accommodation for foot passengers. In addition to these works, hand coal tips are to be provided at different points, and two passenger steamer pontoons, 100ft. long by 25ft. wide, are to be added to the west of the existing pontoon, the pontoons to be covered and to be provided with waiting-rooms.

The Insanitary Property and Artisans' Dwellings Committee of the Liverpool Corporation met on Friday to consider a report of the sub-committee regarding the housing of the working classes, which was discussed at the last meeting of the City Council. The committee had, besides, before them a memorandum which has been drawn up by the Local Government Board, laying down certain regulations concerning the erection of dwellings. The committee now directed Mr. Boulnois, the city engineer, and the deputy-surveyor to reconsider their plans in view of these regulations, and to show in the amended reports all the streets widened to 30ft.

A development of King's Heath as a residential suburb of Birmingham has recently been undertaken by the Birmingham Freehold Land Society. The directors have purchased a site of 55 acres, at a total cost of between £38,000 and £40,000. The land is bounded on one side by the Alcester-road, on another by the Midland Railway, and on a third by a tramway terminus and adjoining property. The society entered into possession a few months ago, and they are engaged in laying out the estate for building purposes. The higher portions of the ground have been levelled, the gravel removed and utilised on the roads and for the purpose of raising the lower portion of the site. Provision has been made for seven roads, aggregating two miles in length, three running from the Alcester-road across the estate, and being crossed almost at right angles by four others, each thoroughfare being of the regulation width of 42ft. The number of plots to be allotted is upwards of 400, and each will be of sufficient size for the erection of two houses of varying sizes, beside which the frontages to the main road will be allotted for 100 shops. Three hundred houses are proposed to be built at a cost as low as £250 the pair, and let at rents of about 5s. per week, each of these plots for the houses covering an area of 500 or 600 square yards. There are also to be sites for about 300 houses, to cost £300 the pair, and to be let at 6s. 6d. each. The remaining houses will be of the small villa type, at rentals averaging £25 a year; the cost of building is estimated at £450 the pair. Every plot will have a frontage of 12 yards, and about 40 yards at the rear, the area being about 500 square yards. The cost of the land will average about 3s. 9d. per yard. The site will remain open during the winter, and building operations will be commenced next spring.

According to Mr. Whitaker, the president of the Geological Section of the British Association, the trial borings for coal at Stutton have reached the base of the cretaceous beds at a depth of 994ft. The palæozoic rocks are of the same series as at Harwich. They do not resemble the old Red rocks found in the London basin, and they are not true Devonian. The opinion of experts is that they form some part of the Carboniferous series. Trial borings might probably be made with advantage in many parts of the country, for as Prof. Boyd-Dawkins pointed out, the boring at Battle had led to the discovery of a useful layer of sulphate of lime, and it is obvious that if coal can be found at workable and paying depths in the south-eastern counties it will be a very important discovery indeed. Mr. Whitaker stated that the present boring at Stutton would probably be continued for as much as 150ft. or more, and the committee did not intend to stop at the one boring, but would make others if appearances and calculations promised success.

The Metropolitan Museum of Art, in New York, is rapidly adding to its resources for the study of sculpture and painting. The north hall of the new wing, which will be opened this season for the first time, is to be devoted to classical sculpture. Of the three sections into which the hall is divided, the first will be filled with casts of Parthenon sculpture. The second section will contain casts of other Greek sculpture, and the third will be filled with casts of Roman work. Many other casts are in store, waiting for space in which to display them, and another wing is soon to be added to the museum for this purpose.

THE echo organ at Westminster Abbey is nearly completed, and will be ready for use in a few weeks. It is placed in the triforium above Tennyson's bust, and the action is electrical, the wind being taken from the main bellows by a pipe let through the vaulting. The organ has now five manuals, and is, perhaps, one of the most complicated in the world, though a splendid instrument. Perhaps the most complicated organ is that at Garden City, Long Island, U.S.A., which is really several organs placed in different parts of the Cathedral of the Incarnation, but all controlled from one console.

On Saturday a new Liberal Club at Choppington, near Gateshead, was formally opened. The building consists of a reading-room, a smoke-room, and a conversation-room on the ground floor, and a lecture-hall overhead; a billiard-room is situated at the rear of the other apartments. Mr. Joseph Maughan, of Choppington, was both designer and builder of the premises, and the cost of the block was about £1,200.

At the Westminster Technical Institute in Rochester-street, on Saturday, the commencement of the winter session was marked by the unveiling of a terracotta bust of the Baroness Bardett-Coutts, to whose munificence the institute owes its existence. The bust, which is more than life size, has been executed by Mr. Owen Hale, professor of modelling and sculpture at the institute, and is placed in the vestibule.

The creditors of William Eckersley, late partner in the firm of Eckersley, Godrey, and Liddlelow, railway contractors, Westminster, who claimed £453,000 from the Greek Government in connection with the Piræus-Larissa Railway, rejected, on Friday, an offer to leave the debtor's interest in the claim with a trustee, with a view to the payment of the debts in full. The case accordingly went into bankruptcy.

Robin Hood Stone, a mass of millstone grit, around which a good deal of tradition has gathered, and which from time immemorial has stood on the rising ground overlooking the Aire Valley north of Keighley, has fallen under the hand of the destroyer. The new water conduit of the Bradford Corporation from Nidderdale passes along the hillside above the Aire Valley, and some time ago fears were entertained that the track would pass in such a direction as to cause the destruction of the stone; but these fears were allayed by a deviation of the line so as just to miss the nearest angle of this ancient landmark. On Wednesday week, however, some workmen drilled holes in the stone, and with the aid of a blast it was cloven into four parts.

Dr. J. Scott Tew, of Nottingham, has been elected medical officer of health for West Kent, an appointment in which fourteen sanitary authorities have combined.

The Act confirming the Lancaster provisional order enabling the Lancaster Corporation to borrow close upon £62,000 for the construction of a new reservoir at Bleatarn, has just received the Royal assent, the application having been made in December last. The new reservoir has been made imperative owing to the development of the town, and more particularly of Morecambe. The work will be commenced forthwith.

At the last meeting of the town council of Southampton, the Mayor presented, on behalf of the subscribers, an illuminated address to Mr. James Lemon, J.P., F.R.I.B.A., in recognition of the services he had rendered the town in connection with the recent extension of the boundaries of the borough.

At Grimsby, on Friday, the memorial stones were laid of extensions to two board schools, the Heneage Schools, where 600 scholars' places are being added, and the Welholme Schools, which will be enlarged by 480 places.

The legislature of New York has just passed an Act providing for the deepening of the canals of that State from their present depth of 7ft. to 9ft. at an expense of £1,800,000 sterling. Many engineers in the State consider, however, that the proposed measures will be made quite to cope with the requirements of the traffic.

Lord Grimthorpe, having completed the rebuilding of St. Peter's Church at St. Alban's, a work commenced immediately the works at the Abbey were finished, has now turned his attention to St. Michael's Church in that city, and has expressed his willingness to build a new vestry. Needless to say, the offer has been accepted with gladness. The church of St. Peter will be reopened on Friday in next week, the 4th October.

Trade News.

WAGES MOVEMENTS.

INVERNESS.—The journeymen plasterers in Inverness, after having been on strike for a fortnight, for an increase of 1d. per hour, resumed work on Monday. The masters offered ½d. of increase, which the men have accepted. The new rate of pay is 7½d. per hour.

NON-UNION LABOUR IN LONDON.—What threatened to become an extensive strike was begun on Friday by the withdrawal of the bricklayers, one hundred in number, from the company of Messrs. Mowlem and Co., at Oak Wharf, City-road, by the Operative Bricklayers' Society, owing to the employment of a non-union workman. Messrs. Mowlem, however succeeded in getting fresh operatives from the Free Labour Asssociation, and their works in hand are going on. It seems that the Building Trade Federation was not supporting the strike. The bricklayers in the employ of Messrs. Smith, of Upper Russell-street, Bermondsey, and also those of Messrs. Nightingale, at Bayswater, also struck for a similar reason; but in both cases outside labour has been imported.

CHIPS.

A meeting will shortly be held to inaugurate the movement to raise a memorial, in the form of a statue in Paddington, to the late Lord Randolph Churchill.

The memorial-stone of the new Wesleyan church at Felixstowe was laid on Thursday in last week. The church, which occupies the corner of Victoria Parade, is to be built of Kentish rag stone, with nave, aisles, and transept, and eventually will have a tower and spire. At present, however, the work will only include the building of the nave and aisles, to hold between 400 and 500 people, at a cost, including the site, of £2,840, the chancel and the tower being matters of subsequent addition. The edifice has been designed by Messrs. Eade and Johns, architects, Ipswich, and the contract is being carried out by Mr. T. Ward, Felixstowe.

A new woollen mill is to be erected at Kilncleuch, near Langholm, N.B. The plans have been prepared by Messrs. Thomas Aimers and Sons, factory engineers and architects, Waverley Works, Galashiels. They show a factory with engine-house, boiler-house, dynamo-house (the building is to be lit with the electric light), oil-house, weaving sheds, finishing department, offices, and warehouses.

The Caxton Convalescent Home at Limpsfield, Surrey, will be opened to-morrow (Saturday) by Mr. J. Passmore Edwards, at whose cost it has been erected. The home, which is intended for members of the printing and allied trades, has been erected on the Chartlands Farm Estate, adjoining Limpsfield-common, and was illustrated by a perspective and plan in our issue of October 5, 1894. Mr. A. Saxon Snell, F.R.I.B.A., is the architect; Mr. R. Durtnell, of Brasted, Kent, was the contractor for foundations; and Mr. A. S. Brighty the clerk of works.

A new Primitive Methodist chapel in Cardigan-road, Leeds, has just been formally opened. It has cost about £2,500, and has been erected from the designs of Messrs. Howdill and Howdill, Leeds. The style is 13th-century Gothic, and the building provides accommodation for about 650 persons.

Sanction having been given by the Local Government Board to the borrowing by the Liverpool Corporation of £35,000, a sum needed for the reconstruction of the present police buildings and the provision of a central fire-station, instructions have been issued to Mr. H. Percy Boulnois, the city surveyor, to immediately proceed with the work; £20,000 is allotted for the reconstruction of the police buildings, and the other £15,000 for the fire-brigade station.

The new military quarters at Woking, which have been provided by the adaptation for military purposes of the former convict prison, will be for the first time occupied, at the end of October, by the Second Battalion of the Queen's Royal West Surrey Regiment. Later on, a cavalry regiment will also be quartered at Woking. The new quarters are named Inkerman Barracks.

Two public halls, one seated for 1,000 persons, the other for 800, have just been built at St. George's, Bristol. They will be known as the Albert Halls. Mr. C. A. Hayes, of Bristol, was the builder.

A new alabaster reredos and oak communion table have been erected in the Church of All Saints, Pavement, York.

The town council of Edinburgh have accepted an estimate for the conversion of property belonging to the city in Advocates'-close into working-men's dwellings. When completed, the property will provide 16 separate houses of two apartments each.

The church of St. Mary, Devonport, was reopened on Sunday, after restoration, the chief work having been the reconstruction of the upper part of the spire, which was in a threatening condition. At the last Easter vestry it was resolved to take down the dangerous portion, and cement over the stump, at an estimated cost of £20. The decision of the vestry to take down, but not rebuild, the shaky part of the spire came under the notice of the Mayor of Devonport, who issued an appeal to the townspeople to raise a fund. This was so well responded to that a committee instructed Mr. C. Gould, contractor, of London, to proceed with the work, Mr. H. G. Luff, of Devonport, having offered his services as architect gratuitously. The other works include repainting and colouring, repairs to organ, and the erection by Messrs. Wippell, of Exeter, of an 18-burner gas corona in the chancel.

The Archbishop of York consecrated, on Friday, a new church in the village of Sleights, near Whitby. The edifice has been necessitated by the dangerous condition of the old structure, and by the inadequate accommodation, especially during the summer months. The style adopted is Early English. The architect was the late Mr. Ewan Christian, of Whitehall, S.W., and the builders were Messrs. Padbury and Son. The total cost is estimated at about £3,500.

The memorial-stones of new Wesleyan Sunday-schools have been laid at Scarborough in connection with Westborough Chapel. The outlay will be £2,250, and accommodation will be provided for 500 scholars.

The value of the new buildings sanctioned by Glasgow Dean of Guild Court on Friday was £28,400.

The fine parish church of St. Germans, Cornwall, has been reopened after restoration under the direction of Messrs. St. Aubyn, Wadling, and Luff, of London and Devonport. The latest addition is a life-sized statue of Our Lord as the Good Shepherd, carved in fine-grained Caen stone, by Messrs. Harry Hems and Sons, of Exeter, and placed in the vacant niche over the altar of the morning chapel at the south-east end of the building.

Mr. Paul Roads, Leeds, and Mr. Bellerby, York, have secured the contract for the erection of a timber-storing shed, 400ft. by 120ft., in connection with the railway shops at Shildon. This is the initial step towards a whole line of erections.

The new scheme for the supply of water to Launceston is so far advanced that the supply-pipe from Carn Down to the Windmill Service Reservoir was tested on Thursday in last week. Mr. R. G. Burt has been the contractor for the Windmill Reservoir, while the laying of the pipes from the intake at Carn Down to Windmill has been carried out by Mr. Fisher, of Millbrook.

The parish church of Dawlish is about to be restored in accordance with plans prepared by Mr. Dobell. The buttresses and pinnacles of the tower will be rebuilt, at an estimated cost of £1,500, and the galleries will be removed.

A conference of representatives of East-end local authorities was held on Monday night, to consider the action to be taken in reference to the forthcoming Local Government Board inquiry into the East London water supply. It was resolved to recommend the respective boards to contribute *pro rata*, according to population, to the cost of the inquiry, and also to invite the assistance of the London County Council in the matter.

Dr. Thompson, Local Government Board inspector, held an inquiry at Cardiff in reference to an application of the Town Council for leave to borrow £2,450, the cost of erecting a cholera hospital on the Flat Holm Island in the Bristol Channel. The existing farmhouse will be used as an administrative block, and the small existing ward, a shed containing six beds, will be used in case of necessity as an isolation ward. The new building, to be built from plans by Mr. Harper, the borough engineer of Cardiff, will comprise two six-bed wards and a nurse's room. The building will be erected of stone and brick, with a slated roof, and the stone will be quarried on the island. The estimate of cost has been based on the actual cost of erecting the new sanatorium at Canton, Cardiff, but 25 per cent. has been added for the cost of conveying materials to the island and providing for the men employed on the erection of the building.

An important work is now being carried on at the Indian Museum at Calcutta, under Mr. Caddy's superintendence—viz., making casts of Asoka inscriptions known to be scattered over the country, and of which Bengal has the largest number of examples. The moulds have been taken at each place by Mr. Caddy, and the casts, when ready, will be deposited in the Archæological Galleries of the Indian Museum.

A stained-glass window, containing a figure of St. Peter, has been placed in Colyford parish church, Devon. Mr. F. Drake, Cathedral-yard, Exeter, carried out the work.

CHIPS.

A drainage scheme is about to be carried out at Mold at an estimated cost of £5,250.

The district council of Milnrow, near Rochdale, have approved of plans and estimates submitted by Mr. James Diggle, C.E., for proposed sewerage works, and have made application to the Local Government Board for power to borrow £16,000 for carrying out the undertaking.

Mr. F. H. Tulloch, an inspector of the Local Government Board, held an inquiry at the Guildhall, Peterborough, on Wednesday, relative to the application of the town council of that city for powers to borrow £1,200 for the purchase of the Fitzwilliam Hall.

The sixty-third report of the Commissioners of Public Works in Ireland, issued on Friday, states that during last year the net expenditure on pubilc works, buildings, and railways in that country was £376,357, as against £469,383 in the preceding quarter.

The town council of Falmouth are taking preliminary steps towards the acquisition of the local gas and water undertakings, and have decided to consult Mr. Silverthorne, C.E., as to the cost and desirability of the transfer.

The foundation-stone of the chancel, the first section of a district church to be built at the rising watering-place of Saunton Sands, Braunton, Devon, was laid last week. Mr. E. Commins, of Exeter, is the architect, and the chancel is to accommodate 100 persons. Mr. R. Hancock is the clerk of works.

The Grammar School at Bromyard has lately undergone extensive alterations and additions from the designs of Mr. F. R. Kempson, F.R.I.B.A., of Hereford. The old school has been gutted out, and a chemical laboratory and class-room fitted up with every facility for lectures. The new wing is built of local stone, with Bath stone dressings. The old boundary walls have been taken down, new ones built, and out-offices constructed suitable for the increased number of boys. The works have been carried out by Mr. Newbold, of Bromyard.

A memorial of white Carrara marble has been placed over the grave in the General Cemetery at Shrewsbury, to the memory of the late Mr. John Cross, of Foregate House in that town, builder, and for many years one of the town council, who died 7th July, 1894, in his 70th year. The stone was erected by Messrs. Llanducci and Davies.

At the Wolverhampton Police-court on Friday, Alfred Peplow, builder, Bellfields, Compton-road, appeared to answer four charges of having contravened the by-laws as to the erection of buildings. Two charges related to the character of the material used as mortar, the amount of lime introduced being inadequate, while the composition included ashes and broken brick. Two of the charges were with regard to the thickness of the cross walls. A fine of £5 and costs was imposed in one case, and the others were withdrawn on payment of the costs.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT.
TEAK, VENEER, and FANCYWOOD
MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Acton, W.—For the erection of new board-room and offices, caretakers' premises, and stores, and additional places for about 550 children, at the Priory Board Schools, Acton, for the School Board for Acton. Mr. Edward Monson, F.R.I.B.A., Acton Vale, W., architect. Quantities by Mr. F. T. W. Miller, of 10, Delahay-street, Westminster, S.W.:—

Lyford, G., Shepherd's Bush	£8,700	0	0
Wilkinson Bros., Finsbury Park	8,470	0	0
Pattinson and Sons, Whitehall	8,330	0	0
Lascelles and Co., Bunhill-row	8,205	0	0
Godson and Son, Kilburn	8,125	0	0
Nye, T., Ealing	8,100	0	0
Foord and Son, Brentford	7,855	0	0
Hooper, G., Acton*	7,600	0	0
Parsons, J., Kennington	7,350	0	0

(Architect's estimate, £7,700.)

* Accepted subject to approval of Education Department.

Ampfield, Hants.—For alterations and repairs to Vicarage House. Mr. A. R. Barker, architect:—

Wheeler, G., and Sons	£472	0	0
Moreton, W. P.	471	0	0
Targett, A.	449	0	0
Goulding and Son	375	0	0
Grace, C., and Sons	345	18	0

Barden, Kent.—For the repair of Lucifer Bridge, spanning the Medway at Barden, Tonbridge, for the Tonbridge rural sanitary authority:—

Punnett and Co., Tonbridge (accepted) ... £290

Blackwall.—For the erection of a jetty at Blackwall for the Receiver for the Metropolitan Police District. Mr. John Butler, F.R.I.B.A., surveyor. Quantities by Mr. W. H. Thurgood:—

Grover and Son	£1,250	0	0
Richardson, J. O.	1,045	0	0
Higgs and Hill	999	0	0
Holloway Bros.	996	0	0
Docwra, T., and Son	982	5	4
Chafen, S.	962	0	0

Blaengarw.—For 60 houses, Blaengarw, near Bridgend, for the Pwllcarn Building Club; Mr. E. Griffiths, secretary. Mr. C. Telford Evans, 14, Queen-street, Cardiff, architect. Quantities by the architect:—

Evans, D., Penygraig	£24,500	0	0
Hatherley and Carr, Bristol	18,500	0	0
Evans, B., Cardiff	15,260	0	0
Thomas, B., and Rees, Skewen	13,370	0	0
Morgan, T., Penygraig	12,540	0	0
Williams and Thomas, Cardiff	11,800	0	0
Davies, S., and Son, Blaengarw*	11,520	0	0

* Accepted.

Budleigh Salterton.—For the construction of the new railway to Budleigh Salterton:—

Aird and Co., London (accepted).

Bursledon, Hants.—For alterations to roof of Rectory House. Mr. A. R. Barker, architect:—

Brinton and Bone	£205	0	0
Barter, C.	197	0	0
Chapman, W. H.	183	0	0

Chalton, Hants.—For alterations and additions to rectory house. Mr. A. R. Barker, architect:—

Read, W.	£650	0	0
Hedjcock, W.	550	0	0
Croad, J.	490	0	0
Edney, J.	470	0	0

Chilbolton, Hants.—For alterations to Rectory House. Mr. A. R. Barker, architect:—

Grace, C.	£130	0	0
Spratt, A.	105	0	0
Heaven, G.	102	15	0

Child's Hill.—For alterations to Red Lion p.h. Mr. A. R. Barker, architect:—

Buck, F.	£569	0	0
Oldrey, H. B., and Sons	563	0	0
Cowley and Drake	544	10	0
Wheeler, G.	539	10	0

Cookham, Berks.—For alterations and additions to "Riverdene," for Mr. Charles Saxton. Mr. Arthur Vernon, 29, Cockspur-street, S.W., architect:—

Colls	£1,100	0	0
Silver	597	0	0
Gibson (accepted)	580	0	0

Croydon.—For alterations to No. 96, George-street, for Messrs. T. S. and C. Parry. Mr. Robert M. Chart, F.S.I., Union Bank Chambers, Croydon, and Mitcham, Surrey, architect and surveyor:—

Smith and Sons	£237	0	0
Goulder, E.	216	0	0
Umlandt and Nicholl	198	10	0
Waller, D., Jun.	191	10	0

(All of Croydon.)

Dover.—For the erection of three shops and premises in Biggin-street, for Mr. Geo. C. Rubie. Messrs. Fry and Gardener, Cannon-street, Dover, architects:—

Wise, Deal	£2,440	0	0
Bromley, Dover	2,350	0	0
Denne, G. H., and Son, Deal	2,306	0	0
Austen and Lewis, Dover	2,180	0	0
Denne, W. and T., Deal	2,180	0	0
Richardson, Dover	2,175	0	0
Hall, Dover	2,150	0	0
Stiff, Dover	2,150	0	0
Hayward and Paramor, Dover	1,990	0	0
Lewis, G., & Sons, Dover (accepted)	1,988	0	0

Dover.—For the erection of two shops and premises in Biggin-street and Worthington's-lane, for Mr. Geo. C. Rubie. Messrs. Fry and Gardener, Cannon-street, Dover, architects:—

Bromley, Dover	£3,100	0	0
Hall, Dover	3,005	0	0
Lewis, G., and Sons, Dover	2,980	0	0
Stiff, Dover	2,885	0	0
Wise, Deal	2,785	0	0
Austen and Lewis, Dover	2,725	0	0
Richardson, Dover	2,700	0	0
Denne, G. H., and Son, Deal	2,688	0	0
Hayward and Paramor	2,634	0	0
Denne, W. and T., Deal (accepted)	2,555	0	0

Dover.—For the pulling-down and rebuilding shop and premises in Biggin-street, for Mr. Geo. Hatton. Messrs. Fry and Gardener, Dover, architects:—

Stiff, H., Dover	£3,585	0	0
Hayward and Paramor, Dover	3,491	0	0
Bromley, W., Dover	3,299	0	0
Austen and Lewis, Dover	3,285	0	0
Lewis, G., & Sons, Dover (accepted)	3,045	0	0

Eardisley, Herefordshire.—For the erection of new cloakrooms, offices, and other alterations at the British School, Eardisley, for the managers. Mr. Ernest G. Davies, M.S.A., St. John-street, Hereford, architect:—

Lewis, W. (accepted).

East Finchley.—For rebuilding the George Hotel. Mr. A. R. Barker, architect:—

Wheeler and Peake	£3,700	0	0
Godson, G., and Sons	3,630	0	0
Wheeler, W.	3,589	0	0
Macfarlane Bros.	3,587	0	0
Voller, F.	3,558	0	0
Brown and Sweetland	3,467	0	0
Mattock Bros.	3,430	0	0

Exmouth.—For laying-out the Manor House Grounds, for the district council. Mr. Johnson, architect:—

Hooper, H. H.	£1,164	0	0
Hayman, A.	997	0	0
Cooper, W. S., and Son	843	0	0

Felixstowe.—For carrying out Contract No. 3 of the sewerage works, for the district council:—

Double, G., Ipswich (accepted) ... £4,180 11 10

(Lowest of eight tenders received.)

Folkestone.—For new chancel and north aisle at St. John's Church. Mr. A. R. Barker, architect:—

Webster, R.	£4,000	0	0
Dove Bros.	3,695	0	0
Petts, J. L., and Son	3,621	0	0
Roberts, L. H. and R.	3,589	0	0
Johnson, W., and Co.	3,573	0	0
Wallis, G. E., and Sons	3,432	0	0
Padget, E.	3,355	4	0
Fearon, T. L.	3,276	0	0
Hayward and Paramor	3,236	10	0

East Greenwich.—For Baptist church, Woolwich Lower-road, S.E. Mr. George Baines, F.R.I.B.A., 4, Great Winchester-street, E.C., architect:—

	Estimate A.	Estimate B.	Estimate C.	Total.	D.	
Scotney and Wootten	£4,209 0 0	£648 0 0	£264 0 0	£5,209 0 0	£85 0 0	deduct
Gorham, F. J.	3,901 1 7	754 2 2	254 4 1	4,909 7 10	20 0 0	,,

Estimate A.—Church and vestries. Estimate B.—Galleries and staircases. Estimate C.—Boundary walls, gates, and railings. Estimate D.—Difference for Bath stone dressings in lieu of terracotta. * Accepted.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2126.

FRIDAY, OCTOBER 4, 1895.

POWER RUNNING TO WASTE.

"THE committee have to be congratulated on having evoked so much talent." So ends the West Ham Technical Institute and Free Library Competition, as far as the 70 out of the 73 competitors are concerned. Of the others, two receive a payment which, though not illiberal as such matters go, is hardly likely to compensate them for time wasted and money spent; and one, or, at least, one firm, has a design recommended for adoption. Plenty of able schemes have been submitted besides these. It might not be difficult to pick out ten or twenty other sets of plans, any one of which would have fulfilled the requirements in a satisfactory way. But, of course, they could not all be chosen—they could not all be rewarded—and in any conceivable selection the great majority of them were predestined to be labour lost. So it is in a multitude of competitions. It is not always the best design which gains the first place. Often, of late years, it has been a very bad design which gained it; but not because no better ones were sent in. There is seldom any scarcity of good work in competitions, and it is sad to think that most of this good work brings no return to its authors, and confers no benefit on anybody else. The ability which produces it is simply ability running to waste.

That is what the architectural observer sees in one direction: a superfluity of the power to reach a certain veritable level in planning, construction, and design. Too many men can do what is tolerably meritorious in these departments, though few can accomplish anything really notable. Now look in some other quarters. The catalogue-laden postman staggers up the stairs and deposits at the architect's door his folios and quartos—his pamphlets and his leaflets. From north and south, from east and west, manufacturers of everything which by any possibility can be used about a building are sending illustrations of their wares. Do these, too, show the same superabundance of talent for design? Why, to look at them one might think there was not a capable designer in the Kingdom. Here, for instance, is an expensively-printed pricebook of several hundred pages, with views, plain and coloured, of everything from mantelpieces to saucepans. Out of the whole lot the saucepans are the only things one can look at without repugnance. Did any human being, in any previous age of the world, ever produce anything as bad as "our Sicilian marble mantelpiece with rouge ornaments"? The boxed-out slabs of this execrable composition have been familiar to us from our youth. We have been inured to them by prolonged suffering, but was there any need to add an unaccustomed torment, in the shape of two little red cylinders, about as big as cigars, stuck on with plaster, and pretending to carry the shelf? Why should anyone purchase this aggravated infliction at the rate of £4 17s. 6d., when he can have the milder sort, without the red cigars, for 40 shillings? And what can be expected of him if he does, except that he will some day buy the "Complete set, price 13 guineas," with scarlet and ultramarine hearth-tiles, pink and green jamb-tiles, red and yellow chimneypiece, and cast-iron "Gothic" stove, with the maker's name in inch-long letters on its fireclay back? Could the manufacturers find nobody to suggest better things than this, or are they still below the intellectual level at which ignorance discovers that it has something to learn? The smallest fraction of the ability which wastes itself in hopeless competitions would be the making of them; but either they do not care to have it, or do not know where to look for it.

Here is another production of the same tribe. It contains nearly 1,000 pages. It begins with register stoves, from half-a crown each—the sort which our friend the "cutting" contractor naturally puts in when the selection is left to him. Well, one cannot expect much for half-a-crown, and we can hardly complain of bad castings, thin metal, ugly shape, and mouldings set thickly with what ironfounders imagine to be ornament. Let us go on to a price at which satisfactory work might reasonably be looked for. Here we find Queen Anne balusters instead of bars; Greek trusses or consoles to stop the ends of them; a stove-back of characteristically Saracenic form; and a diaper from Westminster Abbey on the square margin which frames in the whole. The tiles suggested represent a Welsh waterfall and two sets of imitation fern-leaves; but the use of these is optional, and if a purchaser takes them the disgrace will be on his own head. Moreover, there are good tiles to be had, for the tile-maker has found out, though the ironfounder has not, that good taste has a market value. But the goodness of the tiles, when they are good, only makes the badness of the ironwork more conspicuous. There is neither science, nor art, nor common sense in it. It is full of sharp angles instead of rounded surfaces; its maker has forgotten the very nature of the material he was using; and instead of being 200 years in advance of, he is far more than 200 years behind, what the old Sussex and Hampshire founders did a couple of centuries ago.

We need not mention his "villa railings and gates," except to say that in these he almost excels himself. They are fireworks in metal, with bars and points and spikes darting here and there and everywhere. For more money you can have cast quatrefoils as well, and as many degenerate fleurs-de-lis as heart can wish. But the buyer who really likes quatrefoils should see "our ornamental grating." It is warranted, when 10in. wide, to contain 12in. to the square foot, and the person would be very hard to please who wished for more. Yet some people are never satisfied, and cannot eat honey unless you give them sugar to put on it. Behold, then, for only an additional sixpence, "our extra-superior grating," where every quatrefoil has a square of "our Westminster Abbey diaper" in the centre of it! Was ever such richness seen before? It outshines the Alhambra; it makes the Palatine Chapel at Palermo seem bald and bare, and yet it is all to be had for eighteenpence. What times we live in! But we will take leave of the ironfounder, as we are all glad to do whenever duty has forced us into his dismal den. Let us turn to the brickmaker.

Here is the catalogue of a company who supply an excellent material—excellent, that is, if true, sharp arrises, smooth surfaces, and uniform colour are really the things in which brickwork should glory. Their bricks are hard, and not meant for cutting. All the ornamental features are moulded before being burnt, and to get fresh moulds made takes time and money. Still, with a few dozen well-proportioned, simple sections kept in stock, the architect can do a lot of satisfactory designing in an unassuming way. The catalogue contains 700 or 800 sections, and out of them all not more than four or five are of any service. If the rest were designed by an architect, it must have been by a very young one. Half his profiles look like reminiscences of Paley or Chambers, by a pupil who had casually looked through their books, but had never drawn a moulding before. Here there is a quarter-roll between two fillets—the roll so small and the fillets so large that they completely hide it. Here, again, is a round roll with narrow quirks, such as the joiner loves to make, invisible 10ft. off when new, and sure to choke with dust in a month. Then comes a string-course with a thin, pinched-up nosing, like the edge of a hollow-ground razor. It wants wrapping in cotton-wool to get it safely to your building, and when it is there, the first pigeon that alights on it may peck it off. A little further on there are blocks, with groups of mouldings, a foot or two across, for people who do not like to see mortar joints. And yet "group" is not the right word, for grouping implies some sort of arrangement and connection among the things grouped, while the mouldings here brought together are such as we never met before, and will never, we hope, be unlucky enough to meet again. Perhaps some such thought struck the designer as he drew them; some inner monition that all was not well reached him as he turned over the page. We know what the modern English draughtsman—unless he is a very superior one—does when this happens. He falls back on his acanthus leaves and scrolls, his modillions and his dentils, and his eggs and tongues, feeling that if these will not save him, nothing can. Our brick-book draughtsman does the same, though even more indiscriminately, for amongst his Classic enrichments our old friend, the Westminster Abbey diaper, meets us once more. The 13th-century workmen who first invented it little thought what they were inflicting on us.

The same grievous want of brains shows itself in almost every page which the modern manufacturer sends out. The maker of church and school furniture, though, if judged by his illustrations and not by his goods, he sometimes rises almost to mediocrity, is capable of descending to the depths in which the ironfounder habitually dwells. His pulpits and lecterns and stalls are familiar as household words, and his name is the first that rises to our lips if we have the misfortune to enter a church where his "fittings" are displayed. Still, these things were originally designed by some architect of the past generation who was not quite unworthy of the name. There was some sort of general design about them which can still be traced, though the details have been starved and scamped, and thinned down for commercial reasons. In other examples, commercialism has gone further. The very semblance of design has departed, and there has evidently been no architect in the case. Such bench-ends and seat-backs, as some we have been invited to buy, must surely have been the invention of the firm's office-boy in his leisure hours; while the school-forms might have been shaped, except as far as comfort goes, by the very pupils who are to sit on them. We need not say much of the advertising glazier. There are firms who can do excellent work, and firms who make us "sup full of horrors"; but the prevailing character of modern stained glass is its wearisome insipidity. The ideas are trite, the drawing is tame, the colouring inharmonious, and, above all, the quality of the glass is bad. Now, it is on the quality of the glass that the cost very largely depends, and quality is a matter which committees know nothing of, and care nothing about. They select their proposed window by means of half-a-dozen alternative sketches on paper. It must be "pretty," and it must be cheap. Penny wise and pound foolish, they will not allow their architect to superintend its making, and the result is that they often spend hundreds of pounds on a production only fit to adorn an illuminated "grotto." Amongst all our clever, though unsuccessful, competitors, there must surely be some with an eye for colour, and a talent for freehand drawing. If they could install themselves in place of the commercial stained-glass maker and the commercial church-fitter, some of us, at any rate, would welcome them in their new position.

It is true, no doubt, that the reformer in art, as in other things, needs not only a path in front of him, but a force behind him; and this force it depends on the public to supply. But this only suggests another field in which the able competitor might work. To teach the world at large, by all possible means, to know good art from bad, good materials from bad, good workmanship from bad, is one of the most useful things which the trained architect, in these times, can do. He will be creating possibilities for other capable artists, as well as for himself. He need not confine himself to the details of his own profession. Nothing that men make need be quite alien to him; for the underlying principles of all good design are the same. He may take up any kind of human work—from railway bridges to hairpins, or from crowns and sceptres down to boots and shoes—may study their uses and construction, and show where they fail, and how they might be improved. Nothing is too great or too small for art, since art is only mind transfusing and transforming matter. In civilised periods it permeates everything, and even a few fragments of Roman pottery, or even a few old sandals from ancient London, are quite enough to put modern London to the blush.

CROOKED *VERSUS* SHAPELY PLANS.

THE angle plays a remarkable part in architecture. A building is made up entirely of lines and angles, and the relation of these simple elements with one another is more potent for good or evil than most people imagine. In the hands of unthinking designers they are often a cause of discord and positive ugliness—when, for instance, they are made to do all kinds of feats for the want of a little conciliatory management in joining parts of the design together, or in making agreeable arrangements. We may look at the subject of angles in many ways. The *rôle* the angle plays in plan is, of all others, the most important and conspicuous. It forces itself upon the attention every time we turn a corner of a building and every time we view a building. Crookedness is always a source of disappointment and distrust. It pains the eye to see a crooked wall or a twisted corridor, and no architect has ever succeeded in making a crooked room or corridor agreeable except by disguises or by expedients. And why is the crooked or bent line so naturally displeasing? Is it not because a want of purpose is manifested? There is something indeterminate in a crooked wall or crooked room which shocks the vision. A straight line and a right angle suggest, on the contrary, to the mind's eye, straightforwardness of purpose and honesty. We at once perceive their meaning in the plan of a building: the straight line is direct, the right angle expressive of cubical capacity; and they are also restful. Yet, notwithstanding these self-evident facts, some architects do not hesitate to use crooked or oblique lines and acute or obtuse angles whenever they can do so to save trouble. If the boundary of a site runs at an angle or obliquely, they follow it in the plan, regardless of the awkward appearances produced by them both internally and externally. A little thought would have prevented the irregularity. By setting back the building a little more at one end, a square line could be preserved throughout the front, and all the awkwardness of crooked rooms and roofs avoided. But no; this is thought to waste space, so the design is sacrificed for a few feet of ground. The whole plan and internal arrangement is spoiled if the rooms are preserved of the same width throughout, the corridor is made to rake with the external wall, producing at one end an obtuse, and the other end an acute, angle with the return corridors. It is well if the irregularity can be made to spend itself in an open area, closets, stores, or lavatories, so as to preserve squareness through the other portion of the building.

The competing architect is a great sinner in this respect. If the site is crooked or has irregular angles, he cannot avoid the temptation to follow the boundaries. He thinks it looks saving not to waste space by area room, the plan appears to fit the ground better; but, after all, he gains very little by the process, and he makes it exceedingly difficult to arrange a decent plan. As for the elevations, he does not trouble to show the acute angle, and the perspective is drawn as if it did not exist. Exceedingly clever on paper, but in execution the mistake is soon apparent, and disappointment ensues. Yet, for some unaccountable reason, the crooked angle revels in competition drawings, as if there was some charm in it. We are not thinking of designs like those in the Durham County Council Buildings competition or the Sheffield, in which cases the sites were of triangular or trapezoidal shape, and demanded buildings with irregular angles. In the selected design for the former, lately illustrated by us, the authors have, with masterly skill, made tolerable their acute angle by placing a tower at the corner, and have managed to disguise the obtuse angle of the opposite fronts by planning the council-chamber of horseshoe form and projecting the staircase walls. Also, by an ingenious arrangement of a hexagonal staircase, anterooms, and halls, the centre area has been divided into shapely courts, making quite an ornamental arrangement in connection with the inner corridors of the building. Here, as in Mr. Waterhouse's Manchester Town Hall and his National Liberal Club, a crooked or irregular site has been turned to good account, and the intractable angles have given birth to invention and architectural arrangements. But we are not now thinking of these exceptional sites, but of those in which an oblique boundary occurs on one side or two only. The site selected for the West Ham Technical School and Library in Barking-road affords an instance of how the competing architect, when he is not ingenious enough to turn an accident into a feature of interest, can make a crooked boundary ungainly and unsightly. Out of a large number of designs, many of them of exceptional merit, quite half adopted the crooked to the shapely angle; in other words, made one side of their building parallel to the oblique boundary of the road. To some designers it seems natural to follow boundaries instead of boldly setting their angles square; it is almost a kind of perverseness. In the particular designs to which we allude one block of building was placed at an acute angle with the one to the main road. Many of the authors have adopted certain artifices to disguise the angle—a tower, a rounded corner, breaks—but others have not even done this. A few of the designs show a clever mode of preserving the squareness of the interior by confining the irregularity of the angle to a corner room or a lobby. Of course, this is a much more sensible way than making the awkwardness appear in all the rooms or spoiling a corridor. But, we ask again the question, Is the acceptance of an oblique angle or frontage worth the candle? To say nothing about the external derangement caused by irregular angle, to cornices, to roofing, and other details, is it worth while to spoil corner rooms by making them out of the square?

The internal oblique angle is always an eyesore. Can we look at the oblique-sided room without a shudder of what the occupant or tenant will do to make his carpets fit, or to plan his furniture to the best advantage? But its unsightliness makes itself evident when we cast our eyes up to the ceiling. The very surface above us looks awry, as if one end was higher than the other. We enter a large hotel coffee-room, or restaurant, or City bank, and we see the ceiling beams running at an acute angle with the side of the room, making everything else look distorted. The ribs and panels make matters worse, by showing up more conspicuously the crookedness. An elaborate panelled design is cut askew right across the pattern. What is more offensive? Or one of the architrave beams enters the cornice at an acute angle, which seems to defy all the resources of architect and decorator. Is it not better to lessen the evil as far as can be done by omitting all beams and panelling, and to try and cut off and conceal the obliquity by arching the triangular space and throwing a beam over this portion? Any approach to good architecture is impossible without. It is interesting to see what some of our best architects have done, and to study their methods. Mr. Waterhouse has given us some clever adaptations in his Manchester Town Hall and his Liberal Club, which are worth attention, especially at the intersection of corridors and the meeting of external fronts at acute angles. Other architects have succeeded of turning a necessity into an invention, of creating a *coup de maître* out of an awkward-shaped site. One or two of the Sheffield municipal buildings designs showed ingenious arrangements, such as that we published of Messrs. Flockton and Gibbs; Mr. Mountford's selected design was an example of preserving squareness by recessing the return front of the acute angle by successive steps. The design selected for the Southampton Free Library is another instance of a crooked site having been turned by one competitor into a geometrical solution. We do not recommend the architect to turn his plan in all such cases into geometrical forms—these may be more ingenious than convenient; it may be wiser for him to confine his skill to a hall or vestibule by making a feature of it, or by throwing the irregularity into it, so as to keep the other portions of the plan square. The Passmore Ewdards Settlement Building design, and the plans we published of the Chelsea Embankment Court, are examples of these methods. When there is only one side oblique, the remedy is easily found, and it savours of a want of care and skill to make corridors and rooms crooked or awkward throughout the plan, instead of localising the irregularity in the least offensive way. The whole question of corners and angle-towers turns on this subject of an acute angle, which is truly the *bête noir* of design. There are architects, too, who are defiant in the display of the angles in bay windows, dormer gables, and all kinds of nooks and corners, and who seem to enjoy the whimsical and bizarre variety of them. A sense of confusion and unrest is the consequence. One form jars discordantly on the other, and a distressful want of repose is felt in the design. The love of angularity is often found also in designs which seek to be picturesque; but it is as well to note how few old buildings, those taken as models of picturesque grouping, have a redundance of angles. The acute and obtuse forms are exceptional; the latter appears in all octagonal features, and it is the only other angle besides the square which lends itself to construction and architectural design.

ANCIENT LIGHTS.

QUESTIONS of ancient lights are constantly cropping up both in the Metropolis and elsewhere, and we frequently report cases of injury to old lights by the erection of new premises in the front or in the rear. The injunction to restrain builders is often applied for by persons after the new building or erection is completed or considerably advanced, the consequence of which is that the plaintiff is unable to obtain the redress he seeks, and the defendant is prevented from arranging his building so as not to interfere unnecessarily with the light. In such circumstances as these the defendant, in fact, can plead acquiescence on the part of plaintiff, which the Court is compelled to consider. In fact, it has been ruled in several cases, that if the party having the right to light makes no objection during the progress of the building, he cannot afterwards complain. There is, unfortunately, an idea that by objecting to any erection during the progress, the plaintiff has less chance of obtaining compensation than if he allowed it to be completed. The legal adviser sometimes has suggested this policy, which is done in the spirit of allowing the defending party to be caught in his own trap. But the Courts regard the matter in a more reasonable way. It is very important that an ancient light should be protected and made apparent, and that any infringement should be at once objected to. In many dominant tenements this measure has not been taken. The building owner adjoining has not the slightest idea that certain windows next door are "ancient," and plans are prepared for him for new buildings, or extensive additions, without the faintest suspicion that he is doing anything illegal. His professional adviser, too, often neglects to make inquiries about the easements of neighbouring owners' premises. Drawings are prepared, the contract is signed, and the building is actually put into execution before the dominant owner is made aware of his rights. His light is perceptibly diminished, and then, for the first time, he consults his solicitor. The inattention to the right of light on the part of the plaintiff may be excusable, for he does not know probably anything of the intention of the building-owner; but the case is different with the latter—his architect is supposed to make himself acquainted with the rights of the adjoining owner.

Only the other day a question apparently of this sort came before a judge in Liverpool, where a mantle-maker applied for an injunction to restrain some wholesale druggists from erecting a warehouse in the rear of his (the plaintiff's) premises, which injured certain lights. The erection of the warehouse had actually proceeded till it had considerably diminished the light formerly obtained through the windows, thereby rendering it difficult to conduct the business with regard especially to the discrimination of the colours in materials. On the defendants' side it was argued, and sustained by sworn testimony of surveyors and others, that no interference with ancient lights of a serious nature was caused. His Honour did not grant the injunction, but ordered the motion to stand over till the trial of action.

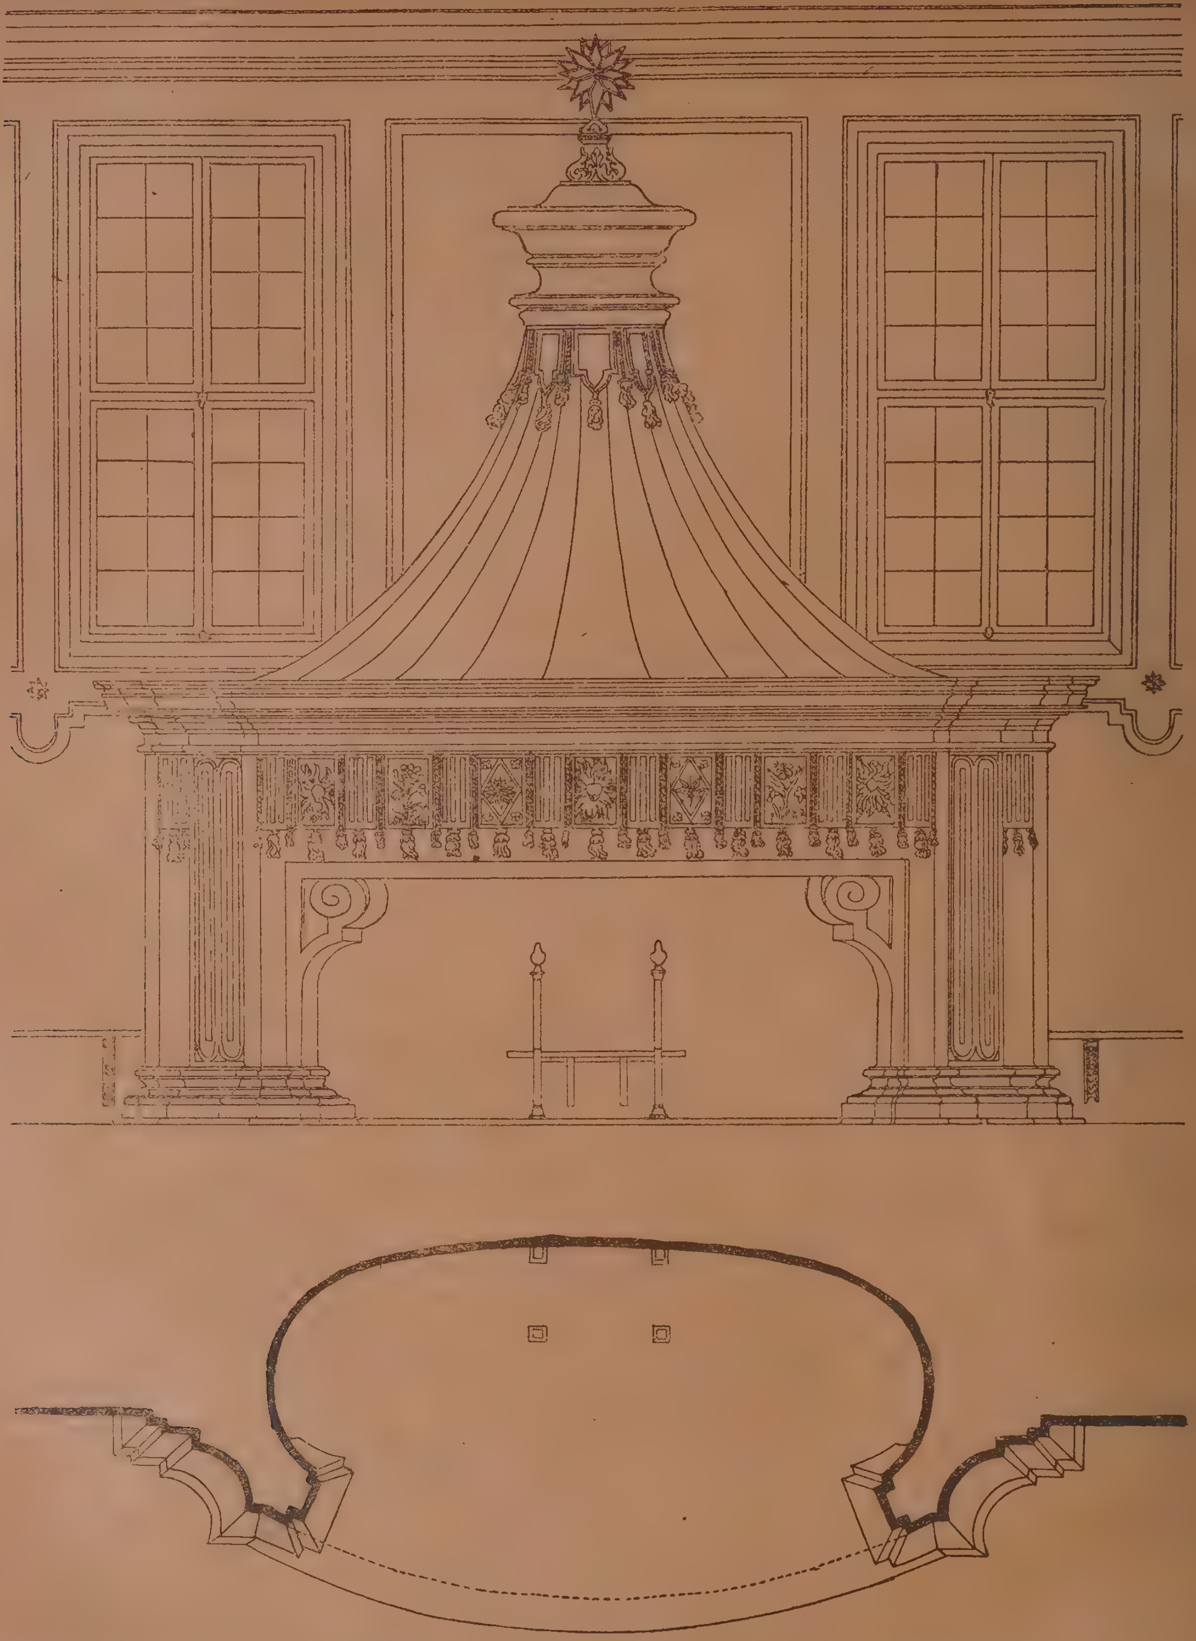
There are particular circumstances which render it exceedingly difficult for an owner of a servient tenement to protect himself or his right of building. Let us suppose A, the owner of certain premises, has a small window about 2ft. or 3ft. superficial in a part of his premises a little distance back from the boundary between the properties; it may be the window of a lavatory or closet. He makes certain alterations, pulls down the inside wall of closet, and throws the space into a large room, and increases the size of his window considerably. His neighbour B cannot interfere, for he cannot obstruct the new window by placing a screen before it without interfering with the ancient light, and this he must not do. He is therefore powerless to do anything but to allow the enlarged opening to remain and acquire the right of the old window. Some time afterwards B may desire to build, but the enlarged window in A's house prevents him from doing so. Again, it is quite true that the original little window of closet was not a nuisance; but the large room, if used, say, as a school or workroom, would be highly objectionable. All this follows the dictum which was laid down by Lord Westbury in his judgment in the well-known case of "Tapling v. Jones." The position and size of the old window must be accurately proved if the owner of a dominant tenement is to obtain advantage by any enlargement of it. If an old building having ancient lights is pulled or burnt down and rebuilt with new windows overlooking the neighbour's land, it is often a difficult question to find out whether the new windows occupy the same positions they did before, or whether they would impose on the servient tenement an additional servitude. It has been ruled that to deprive the new windows of the character of ancient lights, the change must be material. The architect intrusted with rebuilding dominant tenements ought to make a careful survey before pulling down the old premises, so as to be sure of the position of the old windows, for, if there is no evidence as to their position, it has been decided the easement as to the new building cannot be maintained. So, also, the servient tenement owner should ascertain the position of the ancient lights of his neighbour. If these surveys were made, much litigation might be averted; but the fact is, they are seldom undertaken by either party. Sometimes an arrangement between the parties of the respective properties is entered into, to the effect that neither of the contracting parties would object to the other of them raising his building. The plans of the proposed building ought to be submitted to the other party, and if approved, the building owner might be able to proceed. Much litigation might be thus saved. The evidence produced in cases of this kind must be clear and accurate. No doubtful inferences are permissible. One of the modes by which accurate representations of old buildings with ancient lights can be obtained is by the aid of photography. Before taking down an old building a photograph of it on the sides having the ancient lights should be taken; also dimensions of all the windows and their position. The plaintiff ought to be particularly careful to obtain these facts. He ought to have photographs taken from his own windows of the defendant's premises before it is taken down, by which means he can prove to the satisfaction of any Court how far the windows of the rebuilt premises have been changed in position or enlarged. To wait till the interference with his light has taken place is to allow the defendant to go to a large expense, and to permit him to build in ignorance of the rights of plaintiff, which the Court would interpret in favour of the former. In all cases the plaintiff is a gainer by taking immediate action, providing he has clear and unmistakable evidence of substantial interference with light.

PHOTOGRAPHS IN PALL MALL.

THIS week the fortieth annual gathering of photographs forming the exhibition of the Royal Photographic Society has been opened at the gallery of the Royal Society of Painters in Water Colours, and although the vast number of photographs produced on every hand all over the world has greatly increased of late, we do not find that the interest in this exhibition of photographic prints in Pall Mall has very materially diminished. The undoubted popularity of the art developed the fashion for amateur photography so immensely that something like a reaction might have been reasonably anticipated, had not severe competition with a compensating influence inspired greater efforts towards perfection. Whether much advance has been recognised during the past year or not remains a subject for individual opinion; but without professing to discover any material improvement, we certainly find many old masters of the camera quite equal to some of their best previous productions. Not a few familiar exhibitors have been removed by death, but younger men seem coming to the front with admirable work. A most decided improvement has been made by the Photographic Society in the shape and character of their exhibition catalogue, which for the first time contains a number of process-block reproductions from works exhibited besides a few marginal sketches in black and white. The exhibition does not include this time many large photographs of architectural interest, but we may mention a few of very excellent quality, such as the "Gallery of Hardwick Hall," by Richard Keene, Limited, or the "Chapel of the Castle of St. Honorat, Provence," one of the most interesting buildings on the Riviera, here represented by Mr. J. C. Warburg, whose bromide print is thoroughly artistic, and good in colour. Those who wish to supplement their knowledge of the castle and its chapels will find them well illustrated in our pages for December 14th, 1888. Mr. Edgar G. Lee wins deservedly a medal for his carbon picture of the "Gateway to the Castle Garth, Newcastle," with a woman of very ordinary type skilfully introduced in a very natural and unassuming way, giving scale to the forefront of the view. The "Nursery Stairs," another peep from Hardwick, by R. Keene, Limited, hangs near, and is quite worthy of notice. So, too, are Mr. Harold Baker's exquisite studies from Warwick and Tewkesbury, while Mr. W. T. Greatbatch shows a small view of "Watergate-row, Chester," with its quaint, overhanging galleries. Mr. Henry Little brings home some grand photographs from Italy, such as the "Courtyard of the Bargello, Florence," and the Autotype Company exhibit a capital picture from a fresh point of view of "Sta. Maria della Salute, Venice," from a negative by Col. Stewart. Messrs. S. B. Bolas and Co. take a medal for a platinum view of the "S.E. Processional Aisle at Winchester Cathedral," from which building the same firm exhibits some more almost equally good pictures. From Ely Cathedral also they show other prints of great beauty. Among the novelties of the collection are Mr. Lodge's telephotos rendering inaccessible studies of bird life, such as groups of kittiwakes or swarms of puffins disporting themselves upon their island homes, undisturbed by the approach of man, and therefore in an entirely natural enjoyment of their native habits and interior life. Messrs. West and Sons show a fine popular print of "*Valkyrie III.* Racing on the Clyde," and several other nautical studies of similar subjects just now invested with unusual interest, while the many winter scenes exhibited—for example, Mr. W. Martin's "Break-up of the Frost last February on the Thames at Putney," recall an icy cold which, in the present spell of Tropical weather, seems almost welcome and bracing to the jaded sightseer. Mr. Henry Sandland runs a tilt with Mr. Gambier Bolton, whose famous "Zoo" portraits have so long delighted the student of natural history. The pictures shown by Mr. Sandland include zebras, gnus, llamas, and deer, photographed in their pens at Regent's Park with admirable care and knowledge. Landseer's lion, too, is very capitally rendered by another camera.

SCHOOL BOARD ARCHITECTS AND THEIR REMUNERATION.

WHEN the West Ham School Board was elected in the early part of the present year, many of the candidates expressed themselves in favour of the board having an architect at a fixed salary. In due course the matter was referred to a special committee, which, after about six months' inquiries, submitted, at the last meeting, an exhaustive report upon the subject. It may be mentioned that all members who were opposed to the present system of payment to the architect were elected upon the committee. Inquiries were made as to the procedure of other boards, and it was found that the following boards paid a commission of 5 per cent. for all work undertaken by the architect, who provided his own staff and office accommodation:—(*a*) Barking, Blackburn, (*b*) Brighton, Bolton, Cardiff, (*a*) East Ham, Huddersfield, Ilford, Leyton, Newcastle, Norwich, (*a*) Plymouth, (*b*) Portsmouth, Salford, Sunderland, Walthamstow, (*b*) Wanstead, and Wolverhampton. In the cases marked (*a*) the boards provide the clerks of the works, and in those marked (*b*) the architect is specially remunerated for negotiations in connection with the purchase of sites. The following boards had special arrangements with their architects; but the total payment, in every case, was equal to, or in excesss of, 5 per cent. on all

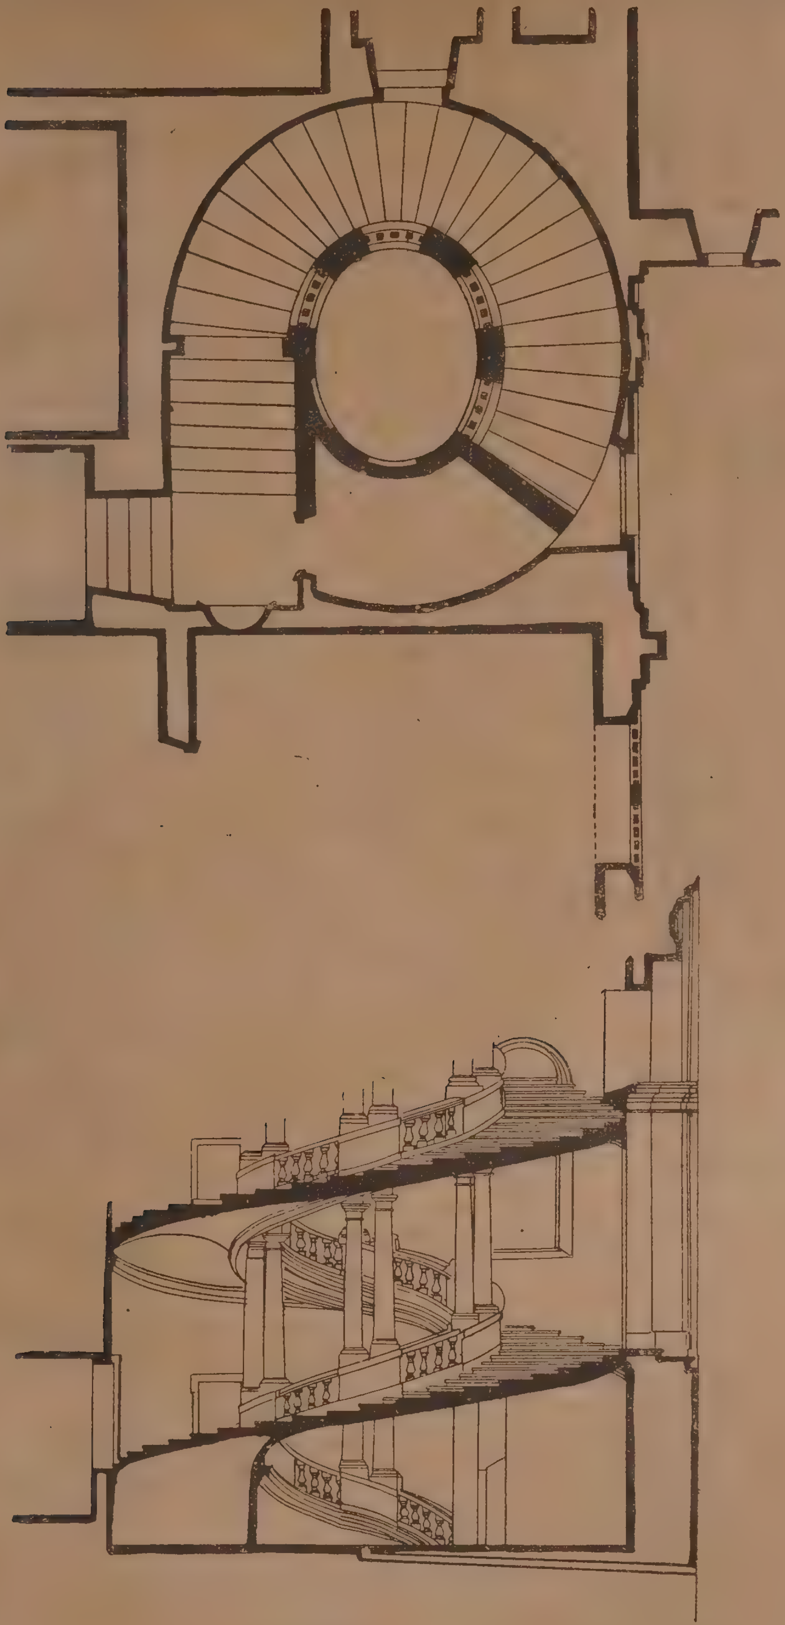


FIREPLACE IN THE RECREATION ROOM OF THE ORATORY OF S. FILIPPO NERI, ROME.—By Borromini.

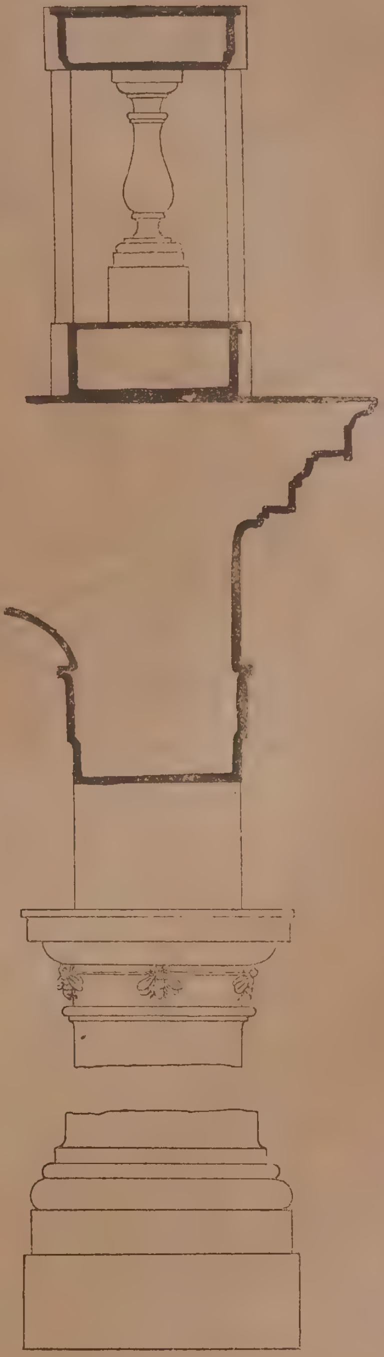
work:—Birmingham, Bradford, Hull, Leeds, Leicester, Liverpool, Nottingham, Sheffield, and Tottenham. In the case of the London School Board, the expense of the architect's department for salaries alone amounted to £38,064, against £4,133 paid by the West Ham School Board. During 1894 the London Board provided 20,914 school places, at a cost for supervision, exclusive of office, rent, stationery, and postage, of £27,105. The West Ham School Board, the same year, provided 6,532 school places, and the expenditure, if proportionate to that of the London School Board, would have been £8,465, exclusive of office, rent, stationery, and postage; whereas the actual cost, including office, rent, remuneration of the various officials, stationery, and postage, was only £4,133, showing a balance in favour of the existing arrangement of £4,332. The general feeling of the committee was that the present arrangement was an economical one, as, although the architect was paid 5 per cent. on all new work, and 2½ per cent on all new furniture, he superintended, without remuneration, the repairs executed at the schools, the accounts of the various builders being also checked by him, and conducted all negotiations in connection with the acquisition of sites. The repair account for the past twelve years amounts to £21,860, and the cost of the sites to £128,099. The committee directed the clerk to furnish a return showing the probable requirements of the board for the ensuing six years, which showed that in all probability an average of three new schools per annum would be required to keep pace with the growth of the borough. The committee decided to report to the board that, in their judgment, the present arrangement is the most economical that can be made, and therefore the most advantageous, in the interests of the ratepayers. This report has been unanimously adopted without further discussion by the West Ham School Board.

* * *

The restoration of St. John Baptist's church, Wakerley, has been commenced, and Mr. A. S. Roberts has been intrusted with the work. The lead on the nave roof has been in a bad condition for many years, while the stones of the parapet, tower, and the base of the walls have perished. On March 24 the destructive gale seriously damaged the roof, the nave, aisle, and porch, besides breaking the windows.



STAIRCASE OF THE BERBERINI PALACE, ROME.—By Borromini.



CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XIII.—ITALIAN RENAISSANCE: MINOR INTERNAL FEATURES.

WHILE partaking largely of the characteristics of the exteriors, the internal features of the Italian Renaissance buildings all possess a lightness of treatment and delicacy of detail such as is suitable to small objects, close to the eye, presented for inspection in a confined space, and they thus illustrate as perfectly as do the general external designs the good taste of most of the Italian architects.

Take, for example, the doorways from the Palaces at Gubbio and Genoa, illustrated herewith, and now in South Kensington Museum, the former instinct with the Florentine and the latter with the more free Venetian spirit. Both are extremely sumptuous; both are full of rich, yet delicate, detail, and both are well designed. Yet the outline of the Gubbio door is simple to severity, while that from Genoa is broken in a fantastic, yet wholly artistic, manner. In the latter, also, considerably higher relief is indulged in than at Gubbio, and the human figure is largely introduced, yet in a sufficiently restrained sense for even the technical fault of the breaking of the pediment to allow of the insertion of Virgin and Child to be readily condoned, as sufficiently heavily also for the somewhat similar error (as some would call it) of employing strong columns for the purpose of supporting cupids, to be pardoned, and even admired for the beauty of the result. In fact, the architects of the Venetian school, while commonly taking liberties of this description, did so with so high an artistic appreciation that the result is rarely objectionable; but this is no reason why men of lower artistic power should succeed by the adoption of similar eccentricities.

The high altar of Sta. Chiara is another typical example of Florentine treatment, with columns which have here a definite function to perform, for there is the arch to carry which forms the hood. The colouring is brilliant to gaudiness, but that is a fault common to Continental churches, and is not in such glaringly bad taste in

the brilliantly-lighted South as it is in the North of Europe.

In Rome the interiors were more forcible, and approximated more closely in treatment with the exteriors. The two examples illustrated are both Late, and both by Borromini, but are very different in conception. The elliptical staircase of the Berberini Palace is simple, severe, and yet very beautiful, with its open well-hole, its coupled Doric columns (bearing the bee upon the necking as their only ornament) and the balustrade. The mouldings of the cornice are peculiar, there being two coronæ and two bed-moulds, the lower of quite unusual section, the cyma reversa having no fillet beneath it, but being continued down as the face of the frieze.

The fireplace in the recreation room of the oratory of S. Filippo Neri exhibits none of the breadth and simplicity of treatment of this staircase; but, on the other hand, there is a fussy example of misapplied ornament, the representation in stone of a tesselated silken hood or canopy being in itself utterly false, especially as a silken canopy, if used above a fire, would soon be destroyed. The liberties, too, which are taken with the Doric triglyphs and metopes are beyond the bounds of the permissible, and the coarse mouldings of the finial, drawing attention to a minor feature, are entirely out of place.

* * *

The Bishop of Salisbury opened on Friday a new Church Institute which has been erected at Dorchester in the parish of St. Peter's. The contractor was Mr. Merrick, of Glastonbury, and the cost of the building £800.

THE MANCHESTER SOCIETY OF ARCHITECTS (INCORPORATED).

THE following is the address of the president, John Holden, delivered at a meeting of the society held October 1st, 1895:—

I have to express my thanks to you for again placing me in the presidential chair, a position which, I need hardly say, I greatly appreciate. Let me first say that the early part of this year has been, perhaps, one of the most painful in the history of the society, now 30 years old, on account of the passing away of one (especially) of our oldest members. The death of James Murgatroyd, on the 26th December last, was one of the greatest losses that this society has sustained, as he was, and had been from its formation, perhaps its best friend, and certainly one of its most energetic workers. The obituary notice in the *Journal* of the Royal Institute of British Architects, a copy of which was also given in the annual report of this society, says no more than what was due to his memory. Though nominally written by myself, it was really compiled by his partner, Alexander W. Mills, from whom I received the information as to his career which no one but himself could give. Mr. Murgatroyd was intimately connected with every movement of this society from its commencement, and no labour was too great for him to undertake if the welfare of the society seemed to demand it. A just and fair-dealing man, of kindly disposition, but with a great contempt for meanness of any description, his memory will long remain with the members of this society, especially those older ones who were intimately connected with him in business operations. Another member who has left us is Thomas Bridgen, a man of undoubted power in his works, and one of the authorities on hospital construction. Like many others connected with this profession, he was overworked, and for some time before his death was incapacitated from the active carrying on of his business, although up to the last his mind was clear. Although well known as an architect, he had very little to do with this society, hence, no doubt, he would be unknown to many of the members, excepting by name. Mr. Lawrence Booth has also passed from amongst us. His name is most intimately associated with the Architectural Association, the members of which joined this society in 1891. He was a past president of that body, and was one of its best friends. Now, gentlemen, having paid this well-deserved tribute to the memory of those friends whom we shall never see again, let us look at the brighter side. Several new members have joined us, men having youth and energy in their favour, men who will, I hope, prove worthy successors to those who have left us. In a society such as ours there is *no ending*—as one passes across the scene, and disappears, another takes his place, and so on. *New men* are constantly coming to the front, as occasion requires, and there are always good men in the background to take the place of those who, for one reason or other, retire from the scene. And let me remind you that there are still many good men outside this Society who ought to belong to it. Many persons drift through life without seeming to think that they

(Now in the South Kensington Museum.)
From a Photo. by Mr. W. Allport.

have any duties to perform to thir fellow workers, and this is, I believe, in many cases simply from a want of thought, and the least hint would bring them to us. I rely upon you, as opportunity serves, to see that persons are directed into the proper channel. When I last had the pleasure of addressing you it was at 36, George-street, a premises singularly adapted to the requirements of the Society, and in which I hoped we had found a permanent home. How little we know what even a short year brings forth. Twelve months only have passed since that time, and we are assembled here in an entirely different place, and our connection with George-street is at an end. As many of you are no doubt unaware of the circumstances which have caused this change, I will shortly state how it came to pass. First, however, I may say that no one is to blame. The Literary and Philosophical Society, like most learned societies, not being in affluent circumstances, and having all the machinery at its disposal for the accommodation of such bodies as ours, arranged with us (and with others) for the use of its rooms, thus gaining a substantial increase in its income practically without expense to itself, and there seemed to be no reason for any change in the arrangements. The present president of the Society happens, however, to be a wealthy man, and having the interests of his society at heart, came forward with a most handsome offer of assistance in the form of an endowment, of course, with certain conditions attached. One of the conditions was, I understand, that the Society should have the premises to itself, at least, so far as library space was concerned. As this endowment was, I am informed, of the value of at least £8,000 his proposals have naturally been accepted, and the Geological Society, who had been located in the building for something like 30 years, and our more recently connected Society received *notice to quit.* I need hardly say that I regret this enforced change very much, as it is difficult for a society such as ours to obtain the accommodation required elsewhere. As you all know, premises in the City of Manchester are difficult to get, and the rents are very high. A committee was appointed to deal with the question; but up to the present time it has not succeed in finding a permanent place. Accommodation for meetings can be found, but the library is another matter entirely, and for the present the books have been placed in the Hon. Sec.'s office, No. 60, King-street, while the meetings for the next twelve months will be held in another room. The committee entered into negotiations in respect of a room in 60, King-street, close to the Hon. Sec's offices, but this fell through. Afterwards a proposition was entertained to occupy rooms in the Queen's Chambers, John Dalton-street, which had been taken by the Geological Society, but this also fell through, at least for the present, in consequence of differences of opinion between the two Honorary Secretaries of that society. Our committee still have the matter in hand and during the present session will, I hope, succeed in making such arrangements as will enable us to consider ourselves permanently settled. The classes in Architecture, which were specially arranged between the committee of the Technical School and the council of this society, have not, I find, been attended as satisfactorily as I could wish. These classes cannot fail to be of great use to the students, especially to those who desire to take any position in the profession and to pass the examination necessary for that purpose, and while I do not advocate the system of cramming, which is bad in principle, still, it is greatly to the advantage of the student that his energies should be directed into a proper channel instead of being wasted on matters of comparatively little importance. It would, I am sure, be a matter of regret to most of us if, from a want of proper support, these classes should be discontinued, and we must remember that there are so many subjects now thoroughly taught in the technical school and its branches, and the classes are so largely attended as a rule, that it is hardly likely the committee of management will continue to deal with a subject specially for a few students only. As to the value of the instruction to be obtained at these schools, I think there can hardly be a doubt; we must remember that teaching is as much an art as architecture itself, and a person requires to be trained to it just as much as to any other profession. It is not every professional or business man who can satisfactorily impart a knowledge of his particular branch to a student, although he may be a master of his craft. This I have particularly noticed for many years, and I think you yourselves, if you will consider the subject, will agree with me. At the same time, I wish you not to misunderstand me, and to suppose that the technical schools or any other similar establishment can by themselves make either an architect or any other business man: this would be a mistake. These schools are a most valuable adjunct to all businesses which are taught in them. And the student will receive instruction in the theoretical and practical branches of his own particular craft which he cannot obtain at his employer's office of works. And it is in the interest of the teachers to impart this knowledge to him. The principals or employers nowadays are busy men, and have neither the time nor (in many cases) the inclination to sit down alongside a student and instruct him. Generally the youth is passed into the office or works, introduced to the notice of the chief clerk or foreman, and left in his charge, and expected to make himself useful. He must then depend upon himself. If he pushes his way, he may get instruction and assistance; if not, he simply works out his time. In any event, he obtains simply a knowledge of the business as carried out in that particular office or establishment, and we all know that no two offices are alike. All professions and businesses are divided into specialities and none more so than our profession. It is therefore important that the student should, in addition to his ordinary office routine, pass part of his time in another place where he will receive that instruction which he cannot obtain amidst the worry and bustle of a business establishment. I speak strongly on this subject, as I wish not only the students, but the older members, to remember it, and to allow to their pupils the time to enable them to attend these classes. I know that in a busy establishment there are times when all hands are required; but I ask you, the seniors, to discriminate between your pupils and your employés. Remember that the pupil comes to you for a certain purpose and often -in fact, generally—pays a large premium, and is, therefore, entitled to consideration. In fact, you are under moral, and generally also legal, covenants to teach him his business as such is carried on in your establishment, and you are to a certain extent responsible for his future. This is an entirely different position to your relations with your employés or clerks who are engaged to do your work and to whom you are under no obligation as to teaching. I ask you, therefore, not only to allow your pupils the necessary time to attend the classes provided for them, but also use your influence and to see that they do attend—to, in fact, exercise that control and supervision over them which you would do over your own son. I confess that I should like to see more of our Manchester students entering themselves for the Royal Institute examinations. There must be a very large number of pupils in the different offices in the city and suburbs, even those represented by this society, yet very few put in an appearance. The examinations have been brought to Manchester now many times, not without trouble, and have been conducted here at a very considerable expenditure of time on the part of comparatively few members, yet I notice that very few of our Manchester students take advantage of them. If you examine the attendances at the preliminary examination one in each year, you will find that in 1893, November, nine students attended, none from Manchester; 1894, March, 16 students attended, three from Manchester (all passed); 1895, March, 25 students attended, two from Manchester (none passed). So that out of 50 students attending these examinations but five were from the principal city, and but three passed; and I particularly notice that many of the smaller towns send up two or three students to each examination, while a large and important city like Manchester, with its several hundred practising architects, can only provide three candidates at the most. There is surely something wrong here, and it is for us to find out the reason, and rectify it. In the qualifying examinations I find the same conditions existing, the proportion rather better, but the numbers small, and the result poor. Taking the same three years, the result is as follows:—Eight candidates attended, four from Manchester, one passed; eight candidates attended, two from Manchester, one passed; five candidates attended (relegated), one from Manchester, one passed. These results cannot be satisfactory, and I must confess I do not understand it. On the roll of this society, which, as you are aware, does not include the whole of the practising architects in the city, were 24, 30, and 36 students. Another matter which has exercised my mind has been the use of the library. The library is not, of course, as yet a very large one, although it is increasing. Still, it even now contains a considerable number of the best standard works. Practically, it contains all that is required for an ordinary student in architecture who wishes to pass the examinations. The register shows, however, that nothing like the use is made of it that the character of the books deserves. Now, a word or two about the prizes given by the society. I note that the small 10s. and 5s. prizes, which entail comparatively little labour or study on the part of the student, are taken up; but the larger prizes are either not competed for, or the responses are poor and unworthy of the sum to be awarded. One prize of £5 5s. has not been awarded since 1891. The larger prizes, which are given on the recommendation of the technical school committee, I am pleased to say remain this year in Manchester, and, I have every reason to believe, have been well earned. The question of education is a serious one as affecting the society, and I confess that I cannot understand it. I should be glad of any information which would assist the council in dealing with it, and I invite communications from the students and others on the subject which may explain in any way the great lassitude and indifference which seems to run through the body of students. I am sure that the council will carefully consider any such communications, and, if possible, meet the difficulty and remedy the defects. For some years past I have noticed the gradual decadence, I may say, of the study of Classic architecture amongst the students; the more catching and sensational styles have been adopted and brought to the front. This is, I venture to think, a mistake on the students' part, as a thorough grounding in the principles of Classic work is of the greatest use, and enables the student more easily to adopt other styles which come up for a short time, and then, as it were, pass away. Understand, I do not complain of the use of these sensational productions; but I consider that they are not suitable as a basis for the education of the student. No doubt they suit the present taste of the public, but the impression is not lasting, and, to my mind, there is a want of boldness which detracts from the dignity of the building. The use of large quantities of surface ornament in low relief, and small and thin mouldings, attract attention to parts of the building, but not to the building as a whole. This society has for many years offered a prize for some subject in connection with Classic architecture; but of late years the response has not been at all satisfactory, and for the last three years the prize has not been awarded. I hope that it will be responded to this year in a more satisfactory manner. I feel bound, however, to say here that I do not personally agree with the withholding of a prize when there is any response to it. When it is once offered I consider that it belongs to the students, and that it should be awarded, unless, of course, the response is a burlesque. The work of a student should not be criticised in the same manner, or with the same strictness, as that of a body of experts in a competition for a building. The object of giving prizes in competition by students is to encourage them to read and work in their own time, and to obtain information which will be useful to them afterwards, and to withhold the prize afterwards disheartens the student, and possibly prevents him from trying a second time. I don't know of anything which would sooner dishearten a youth who has done his *best* in tackling a subject which others have fought shy of, than to be simply told that his production was not of sufficient merit. Strictly speaking, I am well aware that the work produced by most of the students is not, in a commercial sense, worth the amount of the prize; but that is not, in my opinion, the question. The prizes are offered for the purpose of encouraging the youths to study and to work in their own time, by which means they will gain knowledge and experience, and will also, by contact with others, gauge their own abilities; and, personally, if I can induce the student to read and think, and to place his thoughts on paper, I should feel that the money had not been wasted. Every care should be taken not to discourage a student at the commencement of his career, and I hope that those who have to examine the productions of the students during the coming session will bear this in mind. There is one other matter to which I wish to refer shortly—the question of competitions. Unfortunately, this seems to be a standing complaint which comes before us each year, with its record of improper conditions imposed by committees, unjust decisions, and consequently time and money wasted in preparing drawings—and the remedy seems to be as far off as ever. Certainly, when I read some of the conditions now imposed, it is a matter of surprise to me that architects will compete. Amongst the conditions we find:—That the committee does not bind itself to employ any of the competing architects to carry out the work; that the whole of the drawings (however small the premises may be) shall become the absolute property of the committee. Then the accommodation required is given (generally much in excess of what may reasonably be expected for the amount proposed to be expended), and the amount to be expended also fixed. The result of the last condition very often is that the architect is landed in a difficulty when he endeavours to obtain tenders, and the work passes into the hands of some other person at the option of the committee. So far as the work is concerned, the professional assessors are at times ignored, the committee not being under any obligation to carry out his selection. The premium may be paid in accordance with his award, but the work goes to someone else who may have friends on the board. This course acts very hardly on the striving architect who may have endeavoured faithfully to conform with the instructions. The carrying out of the work is, of course, the real object of the competitor so far as he is concerned, as the premium in all probability will but about pay costs out of pocket, and sometimes not even that. The question is a very difficult one to deal with, especially so long as architects of position can be found ready and willing to enter into competitions on almost any terms. If leading architects would refuse to compete excepting on fair and proper conditions, there might be some chance of obtaining better conditions; but until this is done I really cannot see my way out of the difficulty.

THE NEW STREET FROM HOLBORN TO THE STRAND.

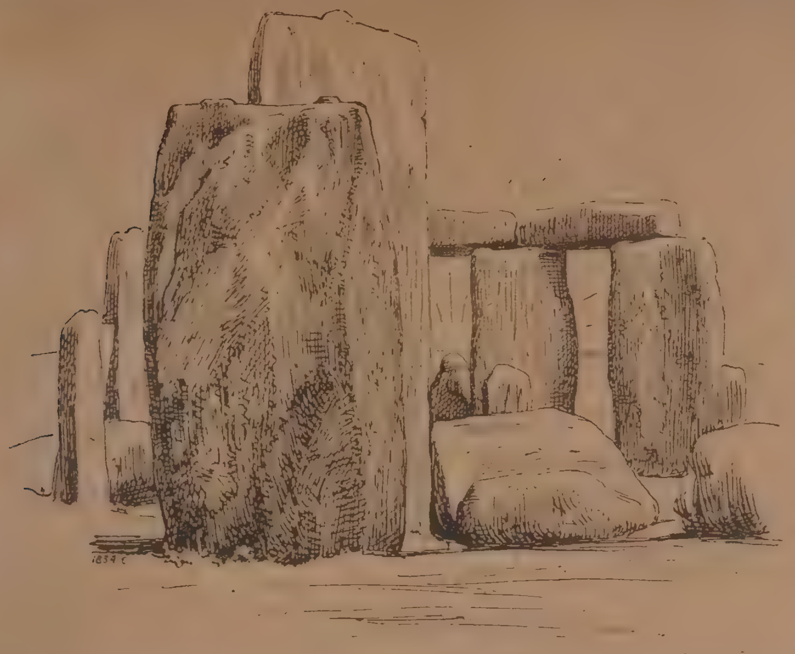
THE London County Council on Tuesday postponed for a week the consideration of the amended scheme for the construction of a new thoroughfare from Holborn to the Strand. In its main lines the new project follows, with some modifications, those of the one adopted by the Council three years ago, and which failed to obtain Parliamentary sanction owing to the objections raised to the betterment clauses. The leading features of the new scheme are:—(1) To combine the Holborn and Strand thoroughfare and the widening of the Strand in a single plan, instead of dividing them in two plans; (2) to obtain a direct and effective avenue from Holborn to the Strand; (3) to provide for the traffic to go eastwards to the City or on to the Embankment, instead of directing it solely towards Charing Cross and Waterloo Bridge. Those objects are proposed to be effected by driving a new avenue 90ft. in breadth from Southampton-row at Theobald's-road, and across Holborn at Little Queen-street straight southwards to the church of St. Mary-le-Strand, setting back the Strand at the junction, and opening out the southern end of the avenue east as well as west into the Strand. This would include the removal of the block of houses south of Holywell-street, and the dealing with the inclosed spaces adjoining the two churches. The proposed street would intersect Great Queen-street, Sardinia-street, Vere-street, Stanhope-street, Wych-street, and Drury-court, and would pass close beside the crowded and insanitary area of Clare-market and contiguous streets lying between Sardinia-street and King's College Hospital. At the same time it is proposed to widen Blackmoor-street and White Hart-street to 60ft. by setting back their south-eastern or City sides, and also to widen Exeter-street to 60ft. by setting back its northern side, so as to afford a direct communication into Catherine-street and Wellington-street, and thence to Waterloo Bridge. It is further proposed to form a spur street, 60ft. wide, from the junction of the new street with Stanhope-street to St. Clement Danes Church, in order to assist the large amount of traffic passing eastwards, and it is proposed to close Wych-street. The scheme, if adopted, will involve the removal of Holywell-street "island," the north side of the Strand from Newcastle-street to opposite the entrance to Somerset House (including the offices of the Strand Newspaper Company, Limited), and also New Inn, the Olympic Theatre, and the Sardinia Electric Lighting Station. The formation of the new thoroughfare and the subsidiary streets now proposed would displace about 3,953 persons. A large part of the district in the line of the new street consists of insanitary courts and alleys—in fact, some of the worst in London, with houses only fit to be pulled down. The gradient of the proposed street will at no part exceed 1 in 50, and will be that for 250 yards only, whereas the gradient of several streets descending into the Strand is at present steeper than 1 in 30. For the 300 yards from Denzell-street to Great Queen-street, the gradient will be only 1 in 89, and thence to Holborn, a distance of 150 yards, the gradient will not be steeper than 1 in 100, giving an average gradient of about 1 in 80. It has been suggested that the scheme, to be complete, should provide for an extension of the proposed new street by means of a bridge across the Thames between Waterloo Bridge and Blackfriars Bridge. But this question has not at present been considered by the improvements committee, who suggest that at the south-eastern and south-western ends of the new street, and with magnificent frontages to the new street, the spur street, and the Strand, would be two large and valuable sites, either of which would be a really good site for the county hall, if the council should decide to build one. In arriving at the estimated cost of the improvement, the committee have endeavoured to ascertain the amount likely to accrue under the betterment clauses; but, owing to recent modifications of the principle of betterment and to want of time, the valuer will not be able to submit a reliable estimate for five or six weeks hence. The total estimated net cost of the improvement would be £2,093,200, which represents about two-thirds of a penny in the pound on the rates for the first year. This estimate does not include the cost of accommodating persons of the labouring class to be displaced.

STONEHENGE AND ITS EARTHWORKS.*

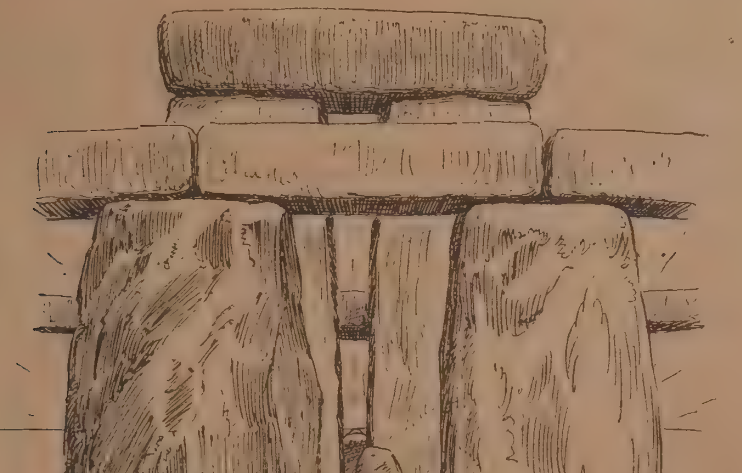
THE varied literature on this subject is unquestionably extensive, and yet, till now, beyond the numerous small handbooks, there was no sufficiently comprehensive work of reference concerning Stonehenge made popular and accessible enough to the general public. The standard books by Inigo Jones, Sir R. Colt Hoare, and Stukeley are, of course, out of print and expensive, while for the greater part more recent contributions to our knowledge of the matter must be sought for among the scattered publications of various archæological and other learned societies. Mr. Edgar Barclay, the enthusiastic author of the volume just published by Mr. David Nutt, has gathered together the salient points thus furnished by various authorities chronologically arranging their writings with their chief recorded opinions in regard to the nature and approximate date of the antiquity of this great world-famed monument. The remarkable divergence of opinion which has always existed, of course, remains one of the most conspicuous and interesting characteristics presented by the much discussed and still unsettled problem as to the origin and history of Stonehenge. That it continues of undoubted interest to a very large number of cultivated persons, of course, goes

---

* Stonehenge and Its Earthworks. With Plans and Illustrations. By Edgar Barclay, R.P.E. London: D. Nutt, 270-271, Strand.



View showing how the Axis of the Temple is given by the Sun-Stone and the Central Trilithon.



Restoration showing Axis, the Tip of the Sun-Stone appearing above the Large Blue Stone, 67.

without saying; and no one who has visited the ruins can fail to have been struck by the continued arrival of visitors in small parties through the greater part of the year. The author says that he has witnessed over two hundred persons assembled to see the midsummer sunrise, and 3 a.m. is not the most convenient of hours for visiting a spot so remote from the comforts of home. Mr. Barclay's plans and photographs, taken after an extended series of visits to Amesbury, were exhibited at 9, Conduit-street, some three years ago, when we drew attention to their exhaustive and technical thoroughness. The material thus got together forms the basis of the present small folio, to which we may confidently direct the study of our readers, though limitations of space preclude our following the author through his tersely written and cleverly argued description, which enhances the value of his copious series of drawings and illustrative details. The first plan, prefacing his account, shows the present disordered and fortunately unimproved and unrestored condition of the ruin, and this plate is followed by a conjectural reinstatement based upon the personal studies of the author, aided, of course, by previous authorities. Elevations accompany the plans, and the numerals attached to individual stones show their relative positions as seen from various points. The striking fact that these monoliths are foreign to the neighbourhood, and belong to geological formations widely different, makes it evident that the construction was a far greater undertaking than present appearances suggest; while the founders' ability in organising labour must have been very extensive indeed. The blue stones, for example, are reckoned by experts to have been brought from some foreign sea-washed shore, possibly by a prodigal expenditure of labour from Brittany, and here located with exact precision as religious symbols on a most elaborated scheme in dedication to the worship of the Sun. Mr. Barclay concludes "that Stonehenge belongs to a brief transitional period, and was raised by British chieftains subject to Roman influence; that the policy Agricola pursued towards the chieftains accounts for the presence of this strange structure on the Wiltshire Downs, whilst the social conditions which rendered its construction possible can have endured but for a few years."

We illustrate two drawings of interest in connection with the fundamental question as to the axis of the building, which is fixed by the position of the sun-stone, as viewed from the centre of the altar-stone, and located between the opening formed by piers No. 1 and No. 30. This line marked the direction of the sun's rays when first seen at the midsummer rising, through this opening; the line passing through it to the tip of the Index-rock is the axis, and the centre of the temple is thus determined. A good many reproductions of older plans show their relative characteristics and ideals, and some old engravings add interest to the work, which is further illustrated by collotypes reproduced from photographs of the ruin from various points of view. The printing and get-up of the volume leave nothing to be desired, and the aim of the author and publisher has been well realised.

PROPOSED WELSH WATER SUPPLY FOR LONDON.

THE London County Council have received from their engineer, Mr. Alexander R. Binnie, a report on the site and yield of certain suggested sources of water supply, and as to the method which might be adopted for storing and conveying water to London, with estimates of cost. Under any circumstances, the consideration of some enlarged scheme of water supply must be taken within the next 20 years, as the valleys of the Thames and Lea become more thickly populated, and the sources already drawn upon become exhausted. By resorting to a district of greater rainfall than the Thames basin down to the intakes of the water companies, which comprises about 3,542½ square miles, a much smaller area than that would suffice for the purposes of Metropolitan supply, and the works can be constructed at such an altitude as to entirely avoid pumping, except for the small areas on the summits of Hampstead, Highgate, Shooter's-hill, and the Sydenham Hills. A concurrence of testimony exists that the area drained by the Wye, the Ithon, the Usk, and the Towy affords a most suitable district from which a supply of water can be derived. As regards quality of water, there can be no doubt that, from its sparsely populated areas and steep mountain slopes, a quality of water can be obtained in every way desirable for the supply of a large population. The vast bulk of the water available will be soft water. Mr. W. J. Dibdin, the chemist to the council, visited the proposed sources of supply in Wales, collected samples, and made the necessary analyses. The general result of his investigations is that the waters examined are all of greater purity than the water supplied to London after filtration. In this district the geological character of the ground and the contour of the valleys lend themselves to the creation of large storage reservoirs. And these reservoirs can be constructed at such an altitude as to enable the water to flow naturally into them, and by gravitation through masonry conduits and iron pipes, so as to be delivered on the northern and southern outskirts of London at such an altitude as to secure at all times a gravitation supply under constant pressure. In the construction of the aqueduct from Wales, about 150 to 170 miles in length, economy in the fall of water is a prime necessity. Consequently, in laying out a line of aqueduct from Wales, it is desirable to design the works so as to introduce as great a length of masonry aqueduct as possible, for the purpose of economising not only the head, but the cost of construction generally, as the necessary masonry of the aqueduct can easily be constructed at less expense than pipes of the required diameter conveying the same quantity of water. The engineer has so designed the works that the total quantity of 415 million gallons a day can be conveyed to London in two separate and distinct aqueducts, which can be carried near to and parallel to each other, or, if thought more desirable for safety, can be so located as to be many miles apart. The most economical arrangement, having regard to the importance of preserving in the future two independent lines of communication, seems to be to divide the sources into two portions of approximately 200 million gallons a day each. One of these portions would include the Llangorse and Usk with the Edw supplies. These yield respectively 182 and 18 million, or a total of 200 million gallons per day. The second division would include the Yrfon and Towy supplies, 135 millions; the Ithon, 37 millions; and the Upper Wye 43 millions, or a total of 215 million gallons per day. In carrying out the earlier portion of the scheme it might be sufficient to take in as a first instalment the Upper Usk and Langorse, leaving the Edw to be added when time required it. In the same way, in constructing the second portion of the scheme embracing the Yrfon, Towy, Ithon, and Upper Wye areas, the Yrfon reservoir could first be constructed, with which the supply from the Towy could be brought in. This, when exhausted, could be supplemented from the Ithon, and ultimately the Upper Wye source would be rendered available. The first section of the main conduit to London would start from Llangorse; the main conduit for the second section would start from the reservoir on the Yrfon. Mr. Binnie proposes to construct at the termination of the aqueducts, both on the north and the south sides of the river, service reservoirs to contain about 16 days' supply, that is to say, of a capacity of 3,200 million gallons each. The water should be filtered before delivery, when the advantage of a pure, clean water, free from every particle of suspended matter, would be secured. For a gross supply of 415 millions gallons a day to provide for all contingencies for a period of 50 or 60 years hence. Mr. Binnie's estimate is £38,800,000, or at the rate of £93,494 per million gallons. It will, however, be sufficient if, in the first instance, the supply afforded by the Usk from the Llangorse reservoir of 182 million gallons a day be brought in the Elstree reservoir. This would cost, say, £17,500,000, or at a rate of £96,000 per million gallons per day.

Following this an additional supply of 18 million gallons a day could be obtained from the Edw at a further cost of £625,500, which would bring the total volume up to 200 millions gallons a day, at a total cost of £18,095,250, or at a rate of £90,476 per million gallons delivered.

The remaining supplies which can be derived from the Yrfon, the Towy, the Ithon, and the Upper Wye, can be brought in one by one at a future date, but they would involve the construction of the second line of aqueduct from the Yrfon to Banstead. Mr. Binnie is confident that this scheme of works is the best for the supply of London, and he believes it to be the cheapest that could be introduced.

THE LONDON FIRE STATION.*

THE Fire Brigade under the London County Council has 57 land fire stations, besides four floating stations upon the river Thames. The land stations accommodate more than 900 men, who are exclusively employed in the service of the Fire Brigade. There are also 10 small portable stations in the streets, which accommodate two or three firemen; and 200 fire-escape stations. The fire stations vary greatly in their arrangements, some being more than 30 years old. These are likely to be superseded within a few years. In this paper I shall describe the more recent kind of fire station now being erected in London at the rate of about four new stations per annum. In the design of a fire station it is essential that the architect should be in close touch with the chief officer of the Fire Brigade. During many years past all stations have been designed after the most careful consultation with the late chief officer, Sir Eyre M. Shaw, K.C.B., and the present chief officer, Mr. J. Sexton Simonds, and their advice has always been placed at the service of the Fire Brigade Committee. The main objects in the design of a fire station are the proper accommodation of the firemen and fire appliances, and to insure that upon the receipt of an alarm of fire the engine and other appliances, with their complement of firemen and horses, can be despatched in the shortest possible time. All the arrangements, the details of which I will now give, are directed towards this end. A satisfactory fire station of the ordinary kind can be built upon a site which is 50ft. wide and 100ft. from front to rear. Stations have been built of less dimensions than these; but the sites of some of the larger stations measure considerably more. Brompton station, of which I exhibit drawings, measures 52ft. across, and only 58ft. from front to rear. The New Cross station, of which I exhibit drawings, measures 120ft. in width and 170ft. from front to rear. This last is the main station in one of the five districts into which London is divided. It is desirable the station should be placed on a corner site, so that it may have two faces fronting the streets. It is sometimes possible to find a site with three faces to the streets; but there are stations, of which Brompton is an example, where the front and rear only face streets. The chief part of a fire station is the engine-room, which should be about 27ft. wide, and 34ft. from front to rear. This will accommodate two fire-engines, standing side by side, and leave sufficient room for passing between. Wherever it is possible, the stable is placed immediately behind the engine-room, into which the doors of the stable open. The horses which it is thought necessary to keep ready for duty stand with their heads facing the engine-room; but there are generally one or two spare stalls of the ordinary kind where the horses may rest. The watch-room is a front room adjoining the engine-room, and is in telephonic communication with the chief stations, and with many of the larger public and private buildings, as well as with many fire-alarm posts placed in the streets. In the larger fire stations the engine-room contains one steam fire-engine and one manual fire-engine; but as fire-hydrants are now being placed at short intervals all over the Metropolis (nearly 20,000 having already been fixed), it is not necessary to use so many fire-engines; and in the smaller stations the place of the manual engine is now occupied by a truck with escape-ladder and other fire appliances. Upon the receipt of an alarm of fire, the fireman on duty in the watch-room rings simultaneously the call-bells of all the officers and men on duty who will have to go out with the engine and ladder truck. The engine-room doors are opened by pulling a cord as soon as the coachman is ready to drive out. There are numerous details of management, the object of which is to expedite the operations of the fireman. With these I do not think it necessary to deal. With regard to the accommodation of the officers and men, it is now the practice to provide in each station a recreation room, where the men can spend their time when waiting their turn on duty. The single men, if any are accommodated, have their own mess-room and dormitory. Each of the married men is provided with a kitchen, a bedroom, and a scullery. The engineer in charge of a small station has one additional room, and the superintendent in charge of a district has two additional rooms, besides an office and a bathroom. The London County Council has increased the accommodation of the firemen by adding the recreation rooms and the sculleries. It has been the practice to provide the entrances to the quarters of each married fireman from a passage in the main building; but recently these entrances have been made as far as possible from open galleries, so that each man has practically a separate house to which access is gained directly from the open air. The stations are usually built four or five stories above the ground level, according to the situation and the accommodation required. There is only one entrance to the station, and that is through the engine-room, so that when a man enters or leaves the building he can leave notice at the watch-room. A shaft for drying fire-hose is inclosed in the staircase, and is about 56ft. high. Over the staircase is a look-out tower, which is generally about 80ft. high. Drying-closets for drying the men's clothes, coal-stores, washhouses, bath-rooms, &c., are also provided; also lifts to take coals, &c., to the upper floors. It is hardly necessary to say that a fire station should be so placed that the horses may safely be driven out at a good speed; for this purpose it is desirable to have a wide road in front of the station, and to set the station back a few feet from the footway. Description of the stations of which drawings are now exhibited:—*Brompton Fire Station.*—This station was designed to accommodate the following men, horses, and appliances:—One engineer, ten married men, one married coachman, two horses, one steamer, one manual, one hose-cart. The engine-room is in the centre of the building, and measures 24ft. by 34ft., and is 13ft. 6in. high. The watch-room is on left of engine-room, and measures 14ft. by 12ft. The stable in this case opens into the yard. The coachman's quarters are on the ground floor to the right of the engine-room. The basement contains a large washhouse, with stores of fuel for the use of the engine, and for use in the firemen's quarters, each man being supplied with a separate coal store. There is one bath for the use of the firemen, as it is necessary that they should have a hot bath upon returning from a fire. Upon the first, second, third, and fourth floors are the quarters of the engineer and firemen. The usual size of each room is about 14ft. by 12ft., and 9ft. high. The architect's estimate for the erection of this station was £6,600. *New Cross Station.*—This is a superintendent's station of the largest class; it stands at the angle formed by two roads, and was built to accommodate one superintendent, one foreman, eight married men, eight single men, two coachmen, four horses, one steamer, one manual, one hose-cart, four escapes, one hose-van, one long ladder on van. The engine-room is 27ft. by 34ft., and 13ft. high, with additional space at the rear. The watch-room and the foreman's office are upon the right of the engine-room, and the recreation-room is upon the left. The single men's mess-rooms and dormitory are placed behind the recreation-room, and there are quarters for two married coachmen at the rear. The yard contains stores for fuel, &c., and shed for long ladder. The basement contains a workshop with stores of various kinds. Upon the first floor are the quarters of the superintendent and the foreman, and married firemen are accommodated upon this floor, as well as the second and third floors. The rooms generally are about 14ft. by 13ft. 6in. and 9ft. high. There is a wash-house with drying-room over the long ladder-shed in the yard. The estimated cost of this station was £16,000.

CHIPS.

The Mersey Docks and Harbour Board has decided upon extensive alterations and improvements at the Foreign Animals Wharf, Birkenhead. In connection with the cold-air stores there is to be a complete renovation of the refrigerating machinery, a large portion of which is of an antiquated description. The new machinery is to be on the Linde ammonia compression system, and an additional chill-room, to be kept at a uniform temperature of 33° Fahr., is to be constructed. The estimated expenditure is £10,000.

At the meeting of the highways committee of the town council of Stockport held on Thursday the 26th of September, Mr. Jas. Platt Widdows, of Oldham, was, by a unanimous vote, appointed as architectural assistant under the borough engineer.

The Safety Tread Syndicate, Ltd. (Mason's patent), have been appointed contractors to H.M. War Office, the Admiralty, and the India Office for the supply of their safety treads.

Messrs. S. Moss and Co.'s sawmills at Gloucester were destroyed by fire on Friday, the damage being estimated at £1,500.

Mr. Richard Carter, M.Inst.C.E., of Springbank, Harrogate, died on the 26th ult., aged 77 years. He was a director and consulting engineer of the Harrogate Waterworks Co., the engineer of the Ripon Corporation Gravitation Waterworks scheme, and consulting engineer for many other public bodies.

The foundation-stone of a new mission church in connection with the parish of St. Margaret, at Durham, was laid, on Friday, at Neville's Cross, a suburb of the city. The church will be Early English in style, and will consist of nave of five bays, short chancel, and apsidal baptistery at west end. Over the south porch is a tower, to be capped by an octagonal broach spire.

At Friday's meeting of the Waterworks Committee of the Bath City Council, Mr. Gilby, the city engineer, stated that up to the present time £15,597 had been paid to the contractors for the new Monkswood reservoir. The tender of Mr. W. Birth, amounting to £216, for relaying mains so as to be out of the reach of frost, was accepted.

What is expected to be the last stage in the drainage scheme for Eastleigh, Hants, was commenced last week by making preparations for substituting iron pipes for a portion of the present drains near Chickenhall, where the principal leaks occur. Messrs. Crook and Batten, of Southampton, are the contractors, and Mr. Green, the former clerk of the works, superintended the alterations.

Intimation is given of the death of Mr. Thomas Shelmerdine, of Edenhurst, Blundellsands. During a prolonged period the deceased was engaged in the pursuit of his profession as an architect and surveyor in Liverpool. He had reached the 77th year of his age.

The Archbishop of York preached on Thursday, the 26th ult., at Doncaster parish church, on the occasion of the reopening of the grand organ, by Schulze, which has been restored by Messrs. Abbott and Smith, of Leeds, at a cost of £1,340.

The members of the water and baths committee of the Heywood town council visited the corporation waterworks at Naden on Wednesday week. The three reservoirs were inspected, and various matters were explained by the engineer, Mr. James Diggle. The chairman of the committee announced that the new 18in. main from Clay-lane to Heywood had been laid. They had laid over 4,000 yards of pipe, with over 1,800 joints. All the joints had been tested, and had proved perfectly satisfactory; not a bad joint in the whole lot.

---

SELECTED DESIGNS FOR THE WEST HAM TECHNICAL INSTITUTE AND LIBRARY.—PRESBYTERIAN CHURCH AND SCHOOLS, TULSE HILL.—THE "PRECINCTS," GATEHOUSE, HAMPTON COURT. — PUBLIC BATHS, BRENTFORD. — DINING-ROOM, "CENTURY" CLUBHOUSE, NEW YORK.

Our Illustrations.

WEST HAM TECHNICAL INSTITUTE AND FREE LIBRARY COMPETITION.—SELECTED DESIGN.

Last week, when the whole of the seventy-five competitive designs for these buildings were on public view in the Town Hall at Canning Town, we gave a review of the plans.* To-day we illustrate the first premiated and chosen design, giving, besides the perspective view and two principal plans, a reproduction of the large-scale detail of the main entrance front. Messrs. Gibson and Russell are the architects. Our illustrations sufficiently display the leading features of the design, and the plans clearly show the internal arrangement, which, it must be admitted, are exceedingly well contrived, the strong point of the plan being centred in the clever disposal of the big hall and its approaches. The library, too, is well worked out, while the distribution of the classrooms leaves little to be desired. We shall illustrate the design further, and give reproductions of the other premiated plans, at an early date.

PRESBYTERIAN CHURCH, COURT ROAD, TULSE HILL, WEST NORWOOD.

The buildings illustrated are shortly to be erected on an elevated site at the corner of Court-road and Thurlow Park-road, for the local Presbyterian body, and comprise a church to seat 450 people, with vestries for minister, elders, and choir; also a school to seat 200 children, with various classrooms, lavatories, &c. The materials to be used externally will be Bourton or Weldon stone for the walls, and Broseley tiles for the roof; the turrets to be covered with copper. The architects are Messrs. Treadwell and Martin, of 2, Waterloo-place, Pall Mall, S.W.

THE GATEHOUSE, THE "PRECINCTS," HAMPTON COURT.

This drawing, from this years's exhibition of the Royal Hibernian Academy at Dublin, shows the entrance gateway leading to two large quads of about forty riverside homes, intended to be built adjoining Hampton Court Palace, on a splendid site overlooking the Green to the north and the Thames on the south. The scheme comprises middle-class houses of the better sort, grouped together with terraces and gardens abutting on the shore, and maintained in common for the use of all residing within the "Precincts," but each house in itself is provided with every necessary convenience, all the reception-rooms in the main blocks being situated towards the river, with a piazza extending the length of the entire façade. The style adopted aims at agreement with the architecture of the Palace, with red brick and Ham Hill stone dressings. Messrs. T. H. Adamson and Sons were engaged as the builders, and Mr. Maurice B. Adams, F.R.I.B.A., the architect. The matter remains in abeyance, owing to unforeseen difficulties which prevented so far the execution of the contract.

PUBLIC BATHS, BRENTFORD.

The foundation-stone of this building was laid yesterday, the 3rd inst., by Mr. James Bigwood, M.P. for Brentford. The accommodation will consist of a swimming-bath, 92ft. by 42ft., with a water area of 75ft. by 27ft. The tank, lined with white glazed bricks, will be 6ft. 6in. deep at one end, and 3ft. 3in. at the other. Twenty-four first-class dressing-boxes will be provided along one side of the bath, and thirty-two second-class dressing-boxes, made of enamelled slate, will be erected on the opposite side. A gallery will run along both sides of the bath, and this will be supported with iron girders and columns. The gangways will be covered with granolithic paving. A soap-hole will be added, and ample provision made for w.c.'s and urinals. The District Council secured a large plot of land surrounding their offices, and arrangements have been made whereby, at no very remote date, an additional swimming-bath can be erected; but until the success of the institution has been assured, it has been resolved to set apart certain fixed days for the different classes of bathers. In the work now proceeding, arrangement is made for the erection of four first-class men's slipper-baths, with a shower-bath, the necessary waiting-room and w.c.; six second-class men's slipper-baths, with waiting-room and w.c.; two first-class and three second-class women's slipper-baths, with waiting-rooms and w.c. With the boiler-house, washing-house and laundry, drying-room, &c., ticket and superintendent's offices, which will be provided, an excellent work will be accomplished. The contract for this work is let to Mr. J. Barnes, of High-street, Brentford, for the sum of £4,850; but, with other work in connection with the building, a loan of £5,200 will be required. The work is being carried out from the designs and under the superintendence of Mr. Nowell Parr, the engineer and surveyor to the council.

DINING-ROOM AT THE "CENTURY" CLUBHOUSE, NEW YORK.

We illustrate on another page this week the refined interior treatment which the architects, Messrs. McKim, Mead, and White, have adopted at this New York club-house. The wooden chimneypiece is appropriate and dignified, though the same remark hardly perhaps applies to the inner marble mantel, which does not seem to harmonise with the rest of the work. The panelling, which is carried up to the plaster ceiling of geometrical pattern, is quite plain, and without moulding. The furniture is substantial, the armchairs in general use throughout adding not a little to the character of the apartment. We are indebted to the *American Architect* for the view from which our sketch was made.

◆

A few months ago the Oak House at West Bromwich was in the market, and was purchased by the mayor (Alderman Farley), who presented it to the town, to be preserved as a museum and art gallery. His worship has now volunteered, at his own expense, to have the house thoroughly restored.

After interior redecoration at the hands of Messrs. Tillotson and Harrison, of Keighley, the Devonshire-street Congregational Church, Keighley, was reopened on Friday. The organ has also been replaced by an instrument which, in point of cost and scope, has no peer in the district. Messrs. Harrison and Harrison, of Durham, have entirely filled the orchestra with an instrument which has 52 stops (43 speakers and nine couplers) and 2,460 pipes. The vox humana has been made and voiced by Messrs Cavaillé and Co., of Paris. The wind is derived from six distinct pairs of bellows, worked by a Ross Valve Company's hydraulic motor. The cost of the extra works to chapel and organ has been £1,500.

The South Australian Waterworks at Happy Valley, near Adelaide, are approaching completion. They are divided into four sections; an inlet tunnel, for which Messrs. Carter and Gummows, of Sydney, are the contractors; an outlet tunnel with valve tower, Messrs. G. and P. Leaby, contractors; the reservoir itself, and the embankment at Clarendon. The work has been done from plans by, and under the supervision of, Mr. Beyer, Government sanitary engineer. The outlet tunnel at Happy Valley is a mile and a half long, the north end finishing into the pipe head tank, from which steel mains lead to Adelaide. The first shot was fired on May 18, 1893, and the last on July 27th of the present year.

COMPETITIONS.

Newport, Mon.—At the meeting of the Newport Board of Guardians, on Saturday, it was decided to award the first premium of £30, offered for the most approved plan for alterations to the workhouse, to Mr. B. Lawrence, of Newport, and the second premium of £15 to Messrs. Swash and Bain, of the same town.

Thurles.—The town commissioners of Thurles have decided to erect a new town-hall and market house, for which they invited designs in competition from architects. After a scrutiny of the designs submitted, those of Mr. J. Kelly Freeman, architect, Sun Chambers, Dublin, were selected.

◆

CHIPS.

Mr. Louis Harper, A.M.I.C.E., Aberdeen, has received an order to supply a steel-rope suspension bridge to be erected over a river in Bombay. The bridge will have a span of 210ft., with a footway 6ft. wide.

Mr. E. J. Halsey, the chairman of the Surrey County Council, opened, on Friday, the new Rutlish Science School at Merton. The building is of red brick, faced with Bath stone dressings, and the outlay has been £7,000.

Mr. Charles Philip Slocombe, late master on the staff of the National Art Training School at South Kensington, died at Hendon on Tuesday, Sept. 24, aged 63 years.

The painting of the front of Buckingham Palace, now in progress, will cost about £17,000. The work will be completed by the end of this month. The Prince Consort got into the hands of incompetent advisers when he built the great front wing. The stone has rotted away considerably, and even three coats of paint, with various additions of both stone and cement, fail to bring the facings of the material up to its proper smooth level.

The restoration committee of Peterborough Cathedral decided, on Friday, to erect a scaffolding at once, so that the west front may be thoroughly examined, as it is feared it is in a very dangerous condition. Already about £1,300 has been subscribed for the purpose, and the committee are appealing for further subscriptions to carry out the work of restoring the façade in accordance with Mr. J. L. Pearson's report.

The foundation-stones of a Primitive Methodist Connection Chapel were laid at Queensferry, Flintshire, on Saturday. The chapel is situated in the heart of the village, on a site presented by Mr. George C. Hughes, its architect and builder. The chapel will seat 200, and cost £600.

In commemoration of the bi-centenary of Doddridge Chapel, Northampton, a branch mission-chapel and schools are about to be built at St. James's End, in that town. The cost will be about £3,000. Messrs. Morley and Anderton, of Goodyear-chambers, Northampton, are the architects.

The town council of Bodmin, after considering several alternative sites, have finally selected that now occupied by Hugo's temperance hotel for the free library premises to be built at the cost of Mr. J. Passmore Edwards.

The Malton urban district council, on the recommendation of a committee, and after hearing an elaborate report from Mr. Millhouse, C.E., Scarborough, and Mr. Richardson, the surveyor, have resolved to accept the tender of Messrs. Simpson and Co., of Pimlico, for a new steam pumping engine for the waterworks, at a cost of £920. The provision of a new pumping engine will effect a saving to the ratepayers of about £200 a year.

The city and borough of Dundee, stimulated by Mr. Andrew Carnegie's offer of a gift of £1,000, have decided to adopt the provisions of the Public Libraries Acts.

At a meeting of the local church building committee held at Bishopthorpe, near York, last week, it was decided that the site of the present church is unsuitable, as it is too near the river, and it was therefore agreed to build the new church on the new burial-ground. It was also decided that the diocesan architect be employed to draw plans and superintend the erection of the building.

Dr. H. G. M. Monk, who since August, 1892, has been medical officer of health for Scarborough, has just received a similar appointment at Leicester. The salary at Scarborough was £350, this including the analytical and meteorological work; and the salary at Leicester is £500.

Mr. A. E. Prescott, assistant town surveyor at Dukinfield, has been elected assistant borough engineer under the Luton corporation.

An intermediate education school is about to be built for Denbighshire on a site of four acres at Penyfont, Llangollen, purchased by the Governing Body on Friday for £1,200.

---

* We understand that the design "65," which we suggested in our review last week might be the work of Mr. J. M. Brydon, was contributed by Messrs. Wigg, Oliver, and Hudson, of Bedford-row.

Building Intelligence.

Bromsgrove.—The new school of science and art at Bromsgrove was opened on Friday by Lord Windsor. The building, which has cost about £2,000, occupies a site adjoining the New-road, near to High-street. It abuts immediately against the new Institute buildings recently opened, and in exterior style and construction the two institutions harmonise and range with each other, and appear like one united building. The main entrance to the schools will be from the New-road. On the ground floor the science students will be accommodated. There is a laboratory for chemical-teaching, 22ft. 8in. by 20ft.; a lecturer's preparation-room; and a lecture-theatre the same size as the laboratory. These rooms are in connection, and on the opposite side of the corridor-passage is a science class-room, 17ft. by 15ft. At the rear of these rooms, which are all 15ft. high, a small room for students is provided. The whole of the upper floor is devoted to the school of art. One room is 56ft. 8in. long by 20ft. wide, and 12ft. 6in. high to the wall-plate, and is lighted by side and top lights. The roof is open-timbered and boarded, supported on four framed principals on stone corbels, carved with the heads of artists. A master's room, to serve also as a committee-room, is provided. The architect is Mr. J. Cotton, of Oxford, and the builders are Messrs. Brazier, Bromsgrove. The carving generally has been executed by Messrs. Martyn and Co., of Cheltenham.

Limpsfield.—The new Caxton Convalescent Home, which has been provided by Mr. Passmore Edwards at the Chartlands Farm Estate, at Limpsfield, Surrey, for the benefit of members of the printing and allied trades in London, was formally inaugurated on Saturday. Mrs. Passmore Edwards unveiled a medallion portrait of her husband, executed in terracotta by Messrs. Doulton and Co., which has been placed over the main entrance. Mr. C. J. Drummond explained that it was originally intended to erect the home at Swanage, but the distance was a great drawback to that site. The building, which stands on nine acres of ground, was to consist of a central block and two wings, and Mr. Passmore Edwards had consented to defray the cost of the centre portion, which accommodates twenty patients. Mr. Edwards had also supplied a library of 512 books. The architect is Mr. A. Saxon Snell.

London County Council.—At Tuesday's meeting of this body, consideration of the important scheme for the construction of a new street from Holborn to the Strand, and the widening of the latter thoroughfare at Holywell-street, estimated to cost £2,093,000, dealt with elsewhere, was postponed for a week. Considerable discussion ensued on a recommendation by the Works Committee that the estimates for various works should be referred back to the committees concerned, the estimates not being satisfactory. The recommendation was carried, an amendment to invite tenders for the works being lost. It was reported that the subaqueous portion of the Blackwall Tunnel had been entirely completed. Work, however, to the estimated cost of some £250,000, some of it of a very difficult and delicate character, remained to be done, and it would be impossible to open the tunnel to the public before the spring of 1897. It was referred to the Technical Education Board to see whether any and, if so, what steps can be taken to establish a permanent museum of arts and crafts in the Metropolis.

Manchester.—Constantine's new baths, Oxford-street, St. Peter's, which have been erected on the site of the older baths, were opened on Sept. 23rd. They consist of first and second class gentlemen's Turkish baths and gentlemen's large Russian bath; also ladies' Turkish and Russian bath. All the baths are fitted with needle, shower, and douche, and supplied with hot and cold water. There are also four private Russian baths, seven ordinary vapour baths, and two local vapour boxes. There are also seven ordinary porcelain baths supplied with hot and cold water, and two rooms are set apart for sulphur and chemical baths. The first-class Turkish bath is provided with a plunge bath, lined with white glazed bricks and with white marble floor, with granite sill and light screen in front, the whole covered by a skylight. The first-class Turkish bath is entered through a screen of Moresquè design. The openings between the several rooms have horseshoe arches in red and buff glazed bricks with enamelled corbels. The ceilings are finished with moulded teak ribs and enamelled glass panels, and the floors throughout are of concrete, with marble mosaic surface and borders. The doors and frames are of hard wood. The windows of the hot rooms are double-glazed with stained glass, and finished with marble window bottoms. The shampooing rooms have marble slabs on white glazed brick risers. Water and steam are supplied by copper pipes cased over so as to be accessible without disturbing bathing operations. There is a lift from the kitchen, with speaking tube, to the Turkish and Russian baths. The main staircase is lighted from an area lined with white glazed bricks and a roof light. The second-class Turkish bath is over the first-class, with Alhambresque oak screen from vestibule. The walls throughout are finished with glazed bricks with horseshoe arches, and the plan is the same as the first class, except for the absence of plunge bath. The ceilings are finished in plaster, with moulded ribs and cornices. In the ladies' Turkish bath the arrangements for control of heat and for supply of hot and cold water are the same as for the first-class bath, and the floors are finished with marble mosaic. The warm air for the Turkish and Russian baths is supplied from two convoluted stoves fixed in the basement, giving a change of air in the hot room equal to 30c.ft. per minute for each bather. The reserve of hot and cold water—about three thousand gallons—is stored in cisterns in the top story. The cold air is received in a chamber on the roof, where it is filtered before it descends to the heating apparatus in the basement. After being heated it is delivered through the separate hot-air flues to the various rooms. The hot and cold air flues are all lined with white glazed bricks. The ventilating flues descend to chambers under the floor in the basement, which in turn are connected to the main shaft. Messrs. Barker and Ellis, of Manchester, were the architects.

Muthill, N.B.—On Saturday week the memorial-stone of the new Free Church, in course of erection at Muthill, Perthshire, was laid by Mr. Samuel Smith, of Orchill, M.P. for Flintshire. The style of the building is French Gothic. The principal front is towards Drummond-street, and shows a buttressed gable with a large traceried window and a central arched and recessed doorway. On either side of the doorway are double-arched windows to the vestibule and cloakroom. A tower is placed at the west corner in a line with the front gable of the church, having a battlement course at the top of the masonry, and finished with a slated spire. The length inside the church is 60ft., and the width is 40ft.; while the height of the ceiling is 35ft. The only gallery is an end one arranged over the vestibule, and sittings will be provided in the church for from 450 to 500 persons. A hall is arranged at the south end. The plans are by Mr. G. T. Ewing, architect, Crieff, and the total cost is expected to be about £2,000.

Salford.—Reopening services were held at St. Philip's Church, Salford, on Thursday in last week, the seventeenth anniversary of its consecration, to mark the completion of internal alterations completed under the direction of Mr. Medland Taylor. A ritual chancel, raised several steps above the nave floor, with a low screen around it, has been formed within the church. The new choir stalls and the screens are of oak. The east end of the south aisle has been made into a morning chapel, and a baptistery has been formed at the west end, with an open oak arcade and balustrade, within which a new font has been placed. A vestry for the choir has been partitioned off at the west end of the north aisle. The reseating of the church and the decoration and painting and other improvements will be proceeded with next year.

Sparkhill, Birmingham.—St. John's Church, Sparkhill, has just been extended in accordance with the original designs for the building, and has been reopened. The first section of a permanent building, consisting of chancel, transepts, and part of the nave, with accommodation for 666 sittings, was opened in 1888. In March last it was resolved to proceed with the enlargement of the church, and to complete the building, with the exception of the upper portion of the tower and spire, at a cost of £2,460. The exterior of the extension is formed of picked common brick facing, with pressed-brick moulded jambs and arches, with Horsley Castle stone sills and heads to the windows, filled in with cathedral glass in lead. The roof is covered with Lewis's tiles. The interior is carried out in accordance with the present portion, being in one span carried on curved ribs, which rest in turn on stone cornices let into the walls. The ceiling is divided into bays, and subdivided by pitch-pine moulded panelling, the spaces between being filled in with adamant cement. The mouldings and general treatment are in the Late Decorated style. The base of the future tower and spire, with entrance porches and lobby, form the lower portion of the west end, the main gable of which is filled in with tracery-headed windows, about 11ft. 6in. wide, and 20ft. in length. The doors and screens are of pitch pine, and partly filled in with glass in lead. The seating arrangements of the whole of the church will give accommodation for 1,000 persons. It is proposed to add the upper portion of tower and spire at as early a date as future funds will permit. The whole of the work has been carried out under the superintendence of Messrs. Martin and Chamberlain, the contractors being Messrs. Sapcote and Sons, of Camden-street, Birmingham.

Southport.—An important group of public works, which have been carried out by the Corporation of Southport, were formally opened by the mayor on Thursday and Friday in last week. The principal of these is the infirmary, inaugurated on the former day. This institution, of which Mr. C. Sydney Ingham, Southport and Manchester, is the architect, is situate in Scarisbrick New-road, and will furnish accommodation for 24 males, 24 females, and 12 children, these three wards being arranged with the administrative block in the centre. The walls are faced with stock bricks and terracotta, Longridge stone being used for dressings. The laundry, kitchen, dispensing, and domestic offices will be large enough for any future additions which may be placed upon the site. The total cost of the building and its equipment has been £25,000. The interior walls of the three main wards are lined with J. C. Edwards's glazed bricks. The floors of these rooms are of oak parquetry, laid by Messrs. Doveston and Co., of Manchester. Messrs. Doulton, of Lambeth, have supplied all the sanitary fittings and glazed ware for mantels. All the corridor and hall floors are paved with marble mosaic by Messrs. J. and H. Patteson, of Manchester. Mr. George Wragge, of Manchester, has been responsible for the wrought ironwork. The clock is by Messrs. Potts and Son, of Leeds. The building has been carried out by Messrs. Wishart and Irving, of Southport, and the clerk of works was Mr. Thomas Field, of Blackburn. The infirmary was illustrated by a perspective and plan in our issue of March 8 of the present year.—The first work opened on Friday was the new marine drive, which, starting from the lifeboat-house, and finishing near Nevill-street, is over three-quarters of a mile in length, and incloses about 90 acres of foreshore. The two marine lakes have been united, and the drive is carried over alongside the pier by means of an iron bridge, the whole of the work having cost £27,750, bringing the total expenditure of the corporation upon the foreshore works, since its purchase of the foreshore, up to £129,000. Both drive and bridge are 42ft. in width. The second was an extension of the electric light plant which trebles the former capacity of the works, bringing it from 4,000 8c.p. lamps to 12,000 8c.p. lamps. Mr. Musgrave, J.P., of Bolton, was the contractor for these works, and Mr. Ferranti, of London, was the electrician. A recreation ground, 6½ acres in extent, close by, and a second one at the end of Duke-street ground, were also declared open.

At the quarterly court of the Plumbers' Company, held at the Guildhall, E.C., on Monday, the following were sworn into office for the year ensuing:—Sir Philip Magnus, Master; Mr. Philip Wilkinson, Warden; Mr. Alderman Richard Hind, Renter Warden.

The gas committee of St. Helen's, Lancs, are taking steps for putting down an electric lighting plant for supplying the centre of the town with electricity. The corporation have made application to borrow £10,000 for the purpose, and a Local Government Board inquiry was held on Tuesday by Mr. F. H. Tulloch, M.I.C.E., an inspector to the Board, who also conducted an inquiry into an application to borrow £3,000 for putting down a new engine and boiler for the Eccleston-hill pumping station, and £3,200 for repaving streets. Mr. Broom, borough surveyor, explained the proposals.

GREATER LIVERPOOL.

THE Liverpool Corporation have received an elaborate report from Mr. H. Percy Boulnois, the city engineer, on the changes in the arrangements in his department necessitated by the passing of the Liverpool Boundaries Extension Bill. It is pointed out by Mr. Boulnois that 8,026 acres will be added to the existing area of the city, making it 13,236 acres, exclusive of the river; 138 miles of roads will be added, making a total of 415 miles; 106 miles of main sewers will be added, making a total of 663 miles, and $19\frac{1}{8}$ miles of tramways, making a total length of approximately 68 miles, including about $1\frac{3}{8}$ mile owned by the Liverpool United Tramways and Omnibus Company. The sewage farms of West Derby and Walton, containing together approximately 385 acres, will also be taken over. Alluding to the officials in the districts which are on the eve of incorporation, Mr. Boulnois suggests that Mr. John Price, engineer and architect to the Toxteth Urban Council, be appointed assistant city engineer for the incorporated districts at a salary of £550 per annum, and that his duties be to assist the city engineer in all works and administration of all kinds in the added areas. Mr. Boulnois also suggests that Mr. W. H. Travers, surveyor, of Wavertree, be appointed district road surveyor for Wavertree and Toxteth, at his present salary of £240 per annum; and Mr. F. C. Everett, surveyor of West Derby, be appointed district road surveyor for West Derby and Walton, at his present salary of £275 per annum. Mr. Joseph Lace, inspector of works, Toxteth, and Mr. John Baker, assistant surveyor of Walton, to be appointed inspectors of sewers for their present districts, at their present salaries of £150 per annum. As to the building surveyor's department, the engineer recommends that an assistant building surveyor be appointed to examine plans, &c., to assist in the conduct of prosecutions, and give general assistance in the work of the department. This officer should have a good knowledge of building construction, and the engineer proposes that his salary should be £175 to commence, increasing £10 per year to £205 per annum. In case the committee adopt his suggestions with regard to the duties arising out of the inspection of, and reporting upon, necessary structural alterations in connection with places of public resort, he recommends that Mr. John Henry Price, assistant surveyor of Toxteth, be appointed chief assistant building surveyor at his present salary of £175 per annum, increasing to £205 per annum, and that Mr. W. Goldstraw's title of "chief assistant building surveyor" be altered to that of "deputy building surveyor." It will be necessary to appoint three additional building surveyors, and with the retirement of an official the number will be increased to four. The engineer has provided for all the engineering staff of the new districts to receive appointments under the Liverpool Corporation, with the single exception of Mr. Stephen Middlebrook, the surveyor to the District Council of Walton, who is to be pensioned under an arrangement already made. Mr. Boulnois then deals with the West Derby and Walton sewage farms and their staff, and proposes that for the present the same staff be continued for both farms.

STEEL SECTIONS.*

A USEFUL handbook has been issued by Dorman, Long, and Co., Ltd., of Middlesbrough, for the use of architects, engineers, and builders who have occasion to specify or adopt steel sections. Messrs. Dorman, Long, and Co.'s new book will be of much convenience to those who have no time or inclination to make special calculation for every section or rolled girder or joist they use—indeed, such labour is unnecessary when we can obtain a section book such as this is, having all the useful sizes in stock, and giving all particulars. The steel of this firm is manufactured by the "Siemens-Martin Open-Hearth Acid Process," recognised as productive of high-class steel, and the tests guaranteed are 28 to 32 tons tensile strain per square inch, and 20 per cent. elongation in 8in. The illustrations are very comprehensive, and include sections of steel bars of various sizes, equal square angle irons, unequal angles, tees, Z iron sections, channels, and the various sizes of I sections, compound girders, plate and box girders, trough decking sections, &c. The handbook thus comprises the advantages of an illustrated catalogue and handbook of formulæ. Those formulæ of general application are given. The moments of inertia and resistance of the various sections of joists and the safe loads for every ordinary span are given on each page of sections. Everything useful or required is tabulated. Thus each table gives the weight per foot in pounds, size, depth and width, area in square inches, moment of resistance in square inches, distributed loads in tons that 1ft. will carry. Three factors of safety equal to 10·6, 8, and 6·4 tons tension per square inch of section respectively are given. These are practically one-third, one-fourth, and one-fifth of the breaking strain; the first to be used for permanent dead loads, the second for live loads gradually applied, and the last for live loads or machinery in motion. Architects requiring to know what girders and joists they must provide for floors carrying certain loads, will find every particular here. For dwellings and offices, the authors state the live load may be taken at 154lb. per square foot, including both dead and live loads. The notes and hints given about angle connections, stanchions, and a variety of other information are very useful.

HYGIENIC VENTILATION.

MR. JOHN LE MARCHANT BISHOP read the following paper before the members of the Manchester Society of Architects (Incorporated) on Tuesday evening, October 1, the President, Mr. John Holden, in the chair:—

Ventilation is a purely hygienic matter, and can only be dealt with upon hygienic principles. The laws of hygiene require that mankind shall at all times breathe pure fresh air, under conditions of immunity from the noxious influences of draughts and variations of temperature. Here we have at once the true object of ventilation and the true standard for ventilation schemes. None of the schemes as yet in vogue in this country approach this standard, and most of them fail egregiously. The chief causes of this general failure may be classified as follows:—1. Misconceptions concerning (*a*) the nature, scope, and objects of ventilation, and (*b*) the various scientific and other conditions to be dealt with. Hence: 2. Practical error, such as (*a*) inadequacy and inappropriateness of the means and appliances employed, (*b*) want of precision in their design and construction or execution, (*c*) absence of system or logical relation in their various proportions, adjustments, and arrangements. In a word, rule of thumb, blind speculation, and empiricism have hitherto been paramount in a sphere wherein the practical embodiment of philosophical thought following upon adequate scientific knowledge could alone be reasonably expected to succeed. The very frequent practice of diverting the fresh currents away from the persons of the occupants of a room, in order to protect them from draughts, thus rendering impossible the acquisition of pure air by those to whom it is essential, and for whose sole benefit it is introduced, often at considerable cost, is typical of a numerous class of practical errors common to both mechanical and automatic schemes. It must be accepted as a cardinal principle that true hygienic ventilation is impossible without a free, direct, and practically continuous circulation of pure fresh air through all parts of the air space. This, in an unoccupied room, would, of necessity, involve the thorough diffusion of the air and its complete and uniform distribution in the diffused condition. Since, however, its diffusion from below would be at once an intolerable nuisance, and hygienically pernicious to the occupants, it must necessarily be diffused from above, and brought to them in its diffused form. This, again, would necessitate its extraction from below—namely, at the floor line—in order to avert its resumption of the current form about the persons of the occupants. The mere extraction from below, however, would effect neither the diffusion nor the distribution of the incoming air. Only by means of a carefully and judiciously devised system of inlets and outlets, freely and uniformly distributed about the room, having definite relation to each other in point of areas, numbers, and situations, to the plan and dimensions of the room, and to the numbers of persons assembled, with other appliances and accessories, affording complete control of the admitted currents—a system, in short, devised upon strict philosophical principles, and executed with mechanical precision—could this be effectually insured. In such case, not only would draughts be impossible, but the whole of the admitted air pressed into actual service would mingle freely amongst the occupants, instead of escaping from the room above their heads; while the exhalations, participating in the general downward sweep, would be immediately drawn towards the outlets and carried away by the exhaust. There is nothing chimerical or Utopian in this, unless the substitution of the guiding principles of science and philosophy for rule of thumb, speculation, and haphazard be such. Upon the principles herein suggested, effectual ventilation, whether by the mechanical or the automatic process, would become an accomplished fact; and more real and effective work would thus be automatically obtainable than either process could yield upon the usual methods. Not only would less power be needed in mechanical ventilation, but a combination of the two processes in one effective system, hitherto impracticable, would then be practicable, whereby the operation of power, indispensable during the periods of assembly, could be suspended during the intervals of recess without interruption to the continuity of the circulation of fresh air, so essential to the purity and healthfulness of all inclosed places of assembly.

REGISTERED GRATES AND TILE STOVES.

WE have received a copy of a new illustrated catalogue of stoves, just issued by Messrs. McDowall, Steven, and Co., Ltd. (late Steven Bros. and Co.), of 4, Upper Thames-street, London, E.C. It is prefaced by a plate of photo. process portraits of members of the firm and views of the extensive showrooms in Upper Thames-street. A large selection of register grates of all sizes and of moderate price are illustrated in the earlier pages, the price being as low as $4\frac{1}{2}$d. per inch. The extra strong grates, ground-glazed and Berlin-blacked, made from 30in. to 40in., $7\frac{1}{2}$ to $10\frac{1}{2}$d. per inch, are worth attention, and the square-headed stoves, from 1s. 1d. per inch, are very suitable for good houses. These are of slow combustion, with brick backs, sides, and bottoms, with 18in. fire. The "Board Room Grate" is well adapted for large schoolrooms and waiting-rooms. Other special ventilating grates illustrated are Captain Galton's "The Marlborough," with adjustable canopy, hob register grates in all finishes and in every variety of pattern, Sussex and Rumford grates, &c. The designs shown for tile stoves, with printed and coloured tiles, and brass reed and electro-bronzed mouldings, are numerous, and many of artistic character. In each case the sizes and prices are given. Plain "interiors," with bars and bottom, now often provided in small houses, are given, some with fluted backs and canopies. It would be impossible to give our readers any idea of the variety of designs of "interiors" with firebrick backs and bars in several styles. These vary in price. Mantel and overmantel designs are numerous. "Adam" iron mantelpieces in several good designs, dog grates, fireplace suites, with wood mantels and overmantels, and a large assortment of tile panels for stoves and hearths, marble and slate chimneypieces, &c., are illustrated. All builders, architects, and house owneas will find the catalogue of McDowall, Steven, and Co. of much use in the selection of castings and ironmongery of this description.

* * *

In a letter of excuse for the unpunctuality of his company's trains, Mr. Sarle, the secretary of the London, Brighton, and South Coast Railway, mentions that the first section of the works of lines and stations near London, that between Victoria and Streatham, is completed, and only awaits inspection by the Board of Trade. These works, which will cost at least a million sterling, are, he states, undertaken not for the purpose of tapping new sources of traffic, but solely to better accommodate the traffic on the existing lines.

The new corporation schools at Doncaster were opened on Sept. 26. The range of school buildings is 202ft. by 59ft. wide. All the rooms are on the ground floor. For each department an entrance-hall, a teachers' private room, and the usual requisites have been provided. In the playgrounds are gravelled play-sheds, gymnastic apparatus, &c. The schools are warmed throughout with hot water. There is accommodation for 220 boys, 220 girls, and 272 infants. The total cost, exclusive of the land, is £5,700, or about £8 per head of the accommodation. Messrs. Malthus and Richardson, of Doncaster, were the contractors.

---

* London: McCorquodale and Co., Ltd., Cardington-street, N.W.

OBITUARY.

A very able and upright man has just departed from amongst us in the person of Mr. Henry Smith, F.S.I., whose death occurred on the 25th of September, at his residence, East Lodge, Clapham Park. The deceased gentleman was apprenticed to his father at Nottingham, but at the age of 21 came to London, and entered the office of Messrs. Myers, the great firm of builders. He was one of their principal measuring clerks from 1852 to 1874. When the Messrs. Myers retired from business, he started as a quantity surveyor on his own account at 8, John-street, Adelphi. Mr. Smith was engaged in his professional capacity in many important works. From 1855 to 1861 he lived at Aldershot, and "measured" at least a million pounds' worth of work done by Messrs. Myers. For that firm he also acted when they built the Netley Hospital, the Reading Assize Courts, the Rothschilds' mansion in Piccadilly, the Staff College at Sandhurst, the grand staircase at Windsor, &c. Afterwards, when in business on his own account, he was quantity surveyor at the Royal Free Hospital, the Brompton Oratory (dome, St. Wilfrid's chapel, &c.), the Portsmouth R.C. Cathedral, St. Joseph's College, Tooting, and the West London Asylum. Mr. Smith had a high character in his profession as a man of great ability and integrity.

CHIPS.

Major-General C. Phipps Carey, R.E., one of the Local Government Board inspectors, held an inquiry on Thursday in last week at the offices of the East Barnet Valley Urban District Council, into an application by the local authority to borrow the sum of £2,650 for private street improvements. Mr. Henry York, the surveyor, appeared for the council.

The Horticultural Society of Shrewsbury, having previously secured the whole of the land and gardens lying between St. Julian's Friars and the Crescent-lane, which it is intended to be converted into recreation and ornamental grounds, have now purchased a strip of land between the latter place and the Kingsland Bridge by the river side. The committee for carrying out the negotiations are now also in treaty with the Kingsland Bridge Company and with Mr. Salt for purchasing the remaining length of riverside land up to the Quarry, and when that is accomplished it is intended to form a broad, continuous promenade as far as St. Julian's Friars or the Grey Friars Bridge.

On Wednesday week, the Bishop of Coventry opened a new mission-room in Spon-end in connection with St. Thomas's parish, Coventry. It is constructed of corrugated iron upon a timbered and felt framework, and is lined with matchboarding. The large room, seating 200 persons, has a platform at one end, and is fitted with comfortable seats of pitchpine. There are also three smaller classrooms at the rear. The cost has been £500. The architect was Mr. H. Quick, the contractor for the ironwork Mr. Boulton Paul, of Norwich, and for the foundations, brickwork, and drainage, Mr. John Isaac, of Foleshill.

Mr. Henry Hines, builder, of Eye, Suffolk, and for many years one of the charity trustees of that town, died on Sept. 26, aged 70 years.

The new railway 'round Etna, about sixty-two miles in length, was formally opened for traffic at Catania on Sunday.

The old Independent Chapel, Sheffield-road, Barnsley, is about to be altered and enlarged. The plans, prepared by Mr. Moxon, architect, Barnsley, provide for an increased number of sittings, and 15 classrooms for the Sunday-school.

A centennial exhibition of lithography was opened on Sunday at the Champ de Mars. The work of the lithographer is traced chronologically from the primitive work of Sinefelder down to the daring street placards of M. Cheret, the most modern of the Parisians.

The town council of Southampton have decided to cover in the two reservoirs on the common at an estimated cost of £6,000. The recommendation was supported by Mr. Matthews, the water-works engineer, and the medical officer of health.

The Liverpool Art Committee have purchased Miss Flora M. Reid's picture, "The Last Sacrament," in the current Autumn Exhibition, for their permanent collection at the Walker Art Gallery. This work is the first that has been bought out of the funds and in accordance with the terms of the late Earl of Derby's bequest. The committee have also secured Mr. Charles J. Allen's statuette group, "Love and the Mermaid," in room No. VI., which is to be reproduced in bronze. The Mermaid is twining her fish-like body round Cupid's feet, and stretching her hands up to him.

Engineering Notes.

Progress of the Blackwall Tunnel.—This undertaking has now advanced to an important stage. From the Kent side the open cutting of 860ft., the cut and cover portion next in succession 946ft., the No. 4 caisson, the inclined portion of the ensuing tunnel 602ft. 6in., the No. 3 caisson and the level tunnel 1,212ft. beyond it, are completed to the No. 2 caisson on the Middlesex side of the river. This caisson is 58ft. in diameter, and the face of the tunnelling shield, 27ft. 9in. in diameter, is touching its external surface. The shield will next be put to work on the land side upon the first portion of the up-hill tunnel 447ft. long. No. 1 caisson will have next to be passed, and a further length of 821ft. of tunnel excavated and formed; and beyond this 436ft. of cut-and-cover and 875ft. of open cutting, these two latter portions being already practically complete. There thus remains 1,311ft. of tunnel to be accomplished, through ballast, clay, and soils of irregular and uncertain character, including, in some parts, masses of rock. The main portion now completed, which includes the crossing of the river from shore to shore, was begun on the Kent side on the 16th September last year, and the shield touched the caisson on the Middlesex shore on Wednesday last, the 25th inst., almost within the limit of one year. The contractors are Messrs. Pearson and Son, and their engineer in charge of the work is Mr. A. W. Moir. The tunnel has been executed by the engineer in chief of the London County Council, Mr. A. R. Binnie.

The annual autumn excursion of the Clifton Antiquarian Club took place on Saturday last, when the day was spent in a visit to Llanthony Abbey and the priory church of St. Mary at Abergavenny.

At the Edinburgh Dean of Guild Court, on Friday, warrant was granted to the city authorities to widen Canonmills Bridge. It is proposed to take down the old toll-house on the south-west side of the bridge, extend the present abutments, piers, and arches of the bridge, construct a new south-west wing wall, rebuild the present parapets in new positions, and alter the footway and carriage-way, all on the west side of the bridge. The result will be to widen the carriage-way by 7ft. and the footpath by 2ft. It is in contemplation to further widen the bridge by 5ft. on the east side.

At a meeting of the Glasgow timber trade held on Friday it was decided that the offer by the secretary of the Royal Exchange of the use of the piazza of that institution for their weekly meetings till the end of the year as an experiment was adopted. The members of the trade have for some time been engaged in trying to solve this question, and have latterly been holding their Wednesday markets on the platform of the Central Station, a spot which was found to be a somewhat unsuitable rendezvous.

A monument, erected to the memory of the late Dr. James Morrison (1816-93), founder of the Evangelical Union, has been unveiled in the Glasgow Necropolis. The monument is a monolith of grey Creetown granite, standing 22ft. in height, and contains as a medallion in bronze a likeness of Dr. Morrison, with inscriptions.

The construction of the new bridge across the river Dee at Queensferry, to replace the primitive ferryboats from the Flintshire to the Cheshire side, is being pushed forward with celerity. The abutments and approaches have been practically completed by Messrs. Schofield and Sons, of Leeds, the contractors for this portion of the work, and the workmen are now sinking the piles upon which the bridge will rest on either side of the river. The width of the river is 400ft., and the bridge will consist of two fixed spans (one at each end) of 140ft. each, and two telescopic portions, each 60ft. long. The ironwork is being prepared by the Teeside Iron Company, Middlesbrough, and its delivery will very shortly commence. The cost of the bridge will approximate £13,000.

A handsome altar frontal and super-frontal, executed under the supervision of Sir Arthur W. Blomfield, A.R.A., and Sons, have just been placed in St. Mary's Church, Mortlake, S.W. The frontal, of red damask silk, comprises a device of lilies, with the sacred monogram, and a powdering of stars and pomegranates inclosed by very rich green orphreys The super-frontal is of red silk velvet, having three scrolls of pomegranates containing the word "Sanctus." It is the gift of the parishioners, and the work has been carried out by Mr. Alfred Stalman, of 67, Frith-street, Soho. The colouring is especially good, and it is satisfactory to know that it has been done entirely by English hands under Mr. Stalman's personal direction.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—E. J. Sampson.—F. O. and Co.—Reg. Plumb. —C. J. W.—E. R. (Bedford).—J. R. B. Co.

Correspondence.

PROPOSED COUNTY INTERMEDIATE SCHOOLS, WELSHPOOL.

To the Editor of the Building News.

Sir,—Supplementary to the letter of Mr. J. H. Williams, appearing in your last issue, permit me to say: Having seen the advertisement in your columns inviting architects to submit competitive designs for the proposed schools, I applied to the clerk to the governors (Mr. E. L. R. Jones) for particulars, and, in reply, received a post-card asking the payment of half-a-crown for them. This sum I duly forwarded, and in course of post received a very rough, sketchy plan of the site, with the surface levels indicated thereon, and a reference to the positions of the water-mains and sewer; also a copy of the "prospectus (preliminary) of the County Intermediate Schools, Welshpool," the latter containing lists of the "governing body" and "teaching staff," the "school curriculum," "rules," &c., the latter *not being of the competition*, but of the school. Deeming the information thus furnished insufficient for the competition, and it being stated in the advertisement inviting designs that the clerk "will send copies of the school curriculum, *and give any other information to intending competitors*," I addressed to him the following questions:—

(1) Is a caretaker's house to be included in the designs?

(2) Are all the competitive drawings to be a uniform scale? If so, to what scale?

(3) Is there any suggested or fixed limit of cost of the proposed buildings? If so, what is the amount?

(4) Are any boundary walls to be included? If so, on what portions of the site?

(5) Are the main walls intended to be of stone or brick?

(6) Are the competitive designs to bear the authors' names, or are they to be submitted under motto?

If a proper code of instructions had been issued the above inquiries would have been unnecessary, and although a fortnight has elapsed since the questions were asked, they have not been accorded even a bare acknowledgment. As a protest against such discourtesy I have abandoned any intention of entering the competition, and would venture to suggest that the persons responsible for it may, with advantage, become pupils in the intended schools, to be instructed in the ordinary business courtesies of life.—I am, &c., Disgusted.

HALF-A-CROWN FOR COMPETITION CONDITIONS.

Sir,—Your correspondent of last week should consider himself fortunate in actually having his 2s. 6d. returned. In common, doubtless, with many others, I applied for the conditions of competition for the County Intermediate Schools, Welshpool, and in reply to a postcard request forwarded 2s. 6d. for same. In return I merely received a prospectus of the school, mentioning the terms of tuition, the school hours, &c., together with a litho. plan of the site, but absolutely no instructions regarding the drawings required, the accommodation to be provided for, materials to be used, or the competition generally. I then wrote to the secretary for further information, but my letter has not even been acknowledged. Is this a hoax?—I am, &c.,

Thomas A. Pole, A.R.I.B.A.

35, Bernard-street, W.C.

THE CONTRACTOR'S PRICE BOOK.

Sir,—This book, recently reviewed in your columns, is a most useful compilation. Its value, however, is limited by the omission of a schedule of the rates of wages on which the several prices have been based. As wages not only vary considerably in different parts of the kingdom, but fluctuate in any one district from time to time, information as to the scale adopted is essential for the proper use of the book. It appears from "Items" Nos. 3 and 4, p. 1 (the latter item being referred to constantly in the work), that the original intention was to give lists of the various wages. The author, Mr. de Vere Buckingham, would, I am sure, enhance the value of his book by giving in your pages the desired information.—I am, &c., Z.

◆

A new public hall built in Palmyra-square, Warrington, at the expense of Mr. J. Charlton Parr, and presented by him to the Warrington corporation, was formally opened on Sept. 26. In the large room sitting accommodation is provided for 1,500 persons. It is very lofty, has galleries on all sides, and is surrounded on every side by a corridor. In addition to all this, there are retiring-rooms and ante-rooms. The work was intrusted to a Warrington contractor (Mr. R. W. Collin), from the design of Mr. William Owen, architect, of the same town.

On Thursday in last week St. Matthew's Church, Smethwick, was reopened after being closed for five or six weeks for restoration, and the gifts which have been placed in the church as memorials of the late Capt. H. Mitchell were dedicated by the Bishop of Lichfield. The memorials consist of a stained-glass east "Crucifixion" window, by Mr. S. Evans, West Smethwick, at a cost of £150; a reredos at a cost of £75, a pulpit, a font, choir-stalls and clergy desks, marble and alabaster altar-railings, mosaic pavements, &c. The decorations were carried out by Mr. Coulton, Birmingham. Mr. J. Hardy, Smethwick, relaid the pavement in the aisles, and he has also altered the pews at his own expense. The whole of the work has been executed under the direction of Messrs. Wood and Kendrick, architects, West Bromwich.

Mr. J. H. Maden, M.P. for the Rossendale Division, christened the engines and started the one machine at present laid down at the Haslingden-grane Brick and Terracotta Company's Works on Saturday. The works are situated about half a mile above Grane Church. The plans have been executed by Messrs. Whittaker and Co., of Accrington. The land, which the company will work for shale, will subsequently be quarried by Mr. H. H. Bolton, who will lay a line from the works to join his existing railway running to the quarries. At present only one brick-making machine is down, but in a short time about eight machines will be at work. The company have taken half an acre of land so far, but have exclusive rights for a radius of four miles.

Intercommunication.

QUESTIONS.

[11433.]—**Steel Bridges (of 100ft. span, and, say, 40ft. wide).**—1. State the most economical proportion for depths of girders with regard to the span? (*a*) State formula for obtaining cross-sectional area at top and bottom boom respectively? (*b*) State the distance rivets should be placed apart in ordinary work? (*c*) The thickness of floor-plates generally adopted? (*d*) State the tensile strain per square inch steel should withstand? (*e*) State the elongation per cent. the same should withstand without fracture?—No Sig.

[11434.]—**Damp Cellar.**—Can any reader explain to me why some cellars in new houses should remain damp after being concreted? The bottom is hard dry sand, of Fox bench nature. The bottom was laid 3in. deep with stone-mason's chippings, and a large quantity of water put on and pounded down after. The top was cement and lime dust 1½in. thick, and seemed all right and nice to look at; but the top remains moist and damp after three months. Sometimes it looks fairly dry, but the damp comes again—in this very dry weather, too. I shall be thankful for any information.—James Brundrett.

[11435.]—**Glass-Lined Tubes, &c.**—The writer would like to know the names of any cast-iron glass-lined tubes, cisterns, &c., for holding water. Any information on the subject would be esteemed.—O. W. L.

CHIPS.

The new police-station in Bute-street, Cardiff, the last of a series of six district stations for the borough, was formally opened last week. It has cost about £5,000, exclusive of site, and has been erected by Messrs. W. Thomas and Co., West Bute Docks, from plans by Mr. W. Harpur, the borough engineer.

The Basingstoke Board of Guardians, at their last meeting, adopted, after a long discussion, a report by a special committee recommending the re-arrangement of the workhouse wards, and the erection of a new infirmary to accommodate 40 cases.

New premises to serve as a Church home and Sunday-school are being added to Christ Church, Blacklands, Hastings. Mr. A. W. Jeffery, of that town, is the architect, and Mr. Warman, the builder. The outlay will be £1,300.

The National Free Labour Association claims to have a membership of 130,000, chiefly drawn from the building trades.

The Manchester and Salford Sanitary Association have obtained a report from Mr. William Thomson, F.C.S., on the Thirlmere water, which will be satisfactory to the corporation of Manchester. Mr. Thomson was requested to test the supply. The water does not, he finds, dissolve any metallic lead, and is, therefore, quite as safe as the former Manchester water.

The urban district council of Gainsborough have decided that the services of Mr. Jabez Church be called in for the purpose of supervising the work of the new reservoir, an amendment asking the council's surveyor to do the work being lost.

Owing to an outbreak of fever in Grantham, temporary hospitals have been erected at very short notice, the same being warmed and ventilated by Shorlands' patent Manchester stoves, specially designed for such buildings.

At a meeting of the Dale Memorial Committee held in Birmingham on Friday it was decided that the public memorial to the late Dr. W. R. Dale should take the form of a seated statue in marble, which, when completed, will be placed in the Art Gallery in that city. The commission will be given to Mr. Onslow Ford, R A., and it is anticipated that it will be executed in about two years.

According to the estimate of the Leeds city engineer (Mr. T. Hewson), the cost of the lands and buildings proposed to be acquired by the sanitary committee for the purpose of improving a portion of East Leeds will be about £129,185. For alterations and the making of new streets there will have to be added the sum of £36,259, but the deduction of £58,473 for surplus land will leave the net expenditure £106,971.

The death is announced of Mr. William Frye, the senior inspector of the Department of Buildings of Boston, Mass. Mr. Frye was a native of Salem, and, after serving his apprenticeship, established himself at Boston as a builder. For some time he was associated with Nathaniel Adams, a noted builder of the last generation; but in 1873, soon after the establishment of the Department of Buildings, he was appointed inspector, and placed in charge of the mercantile district, by far the most important in the city.

In a few weeks' time there will be laid before the Corporation of Stockton a large scheme, which will provide for the construction of a road along some two miles and a half of the river frontage towards Haverton-hill, which, it is anticipated, will tend to largely develop the town by attracting fresh industries to it.

Legal.

THE RATING OF PARKS.

THE question of the rateability of local parks, gardens, and the like, which are really open for the public benefit, is one of much interest and importance, especially to ratepayers. The whole matter was gone into very fully by Mr. Baron Pollock and Mr. Justice Wright in the recent case of Brockwell Park (*Times*, Aug. 9, 1895), where the London County Council appealed against the rating assessment. It appeared that this park of 78 acres was kept by the Council as a public park and recreation ground for the perpetual use of the people. There was a house on the land used for various public purposes, and a lodge and a cottage, in which constables and keepers lived rent free. The grazing was let, but the whole income from this and other sources was less than the £2,000 a year which it cost to keep up the place. The Council were assessed separately upon the land, house, lodge, and cottage at a gross estimated rental of £406, and rateable value of £359. From this the Council appealed, and the question was whether they were rateable at all in respect of this public park and houses thereon, and if so, upon what basis.

The Court delivered a considered judgment, going very carefully into all the authorities. They began by laying it down that there are no absolute exemptions from rateability except by express statute, or where land is appropriated to purposes of public government. With these exceptions all land is rateable if its occupation is, or can be, beneficial, even though its purpose is merely fiduciary. This value may be little or nothing; but still the statutory test of what it is worth to let by the year must be applied, if possible. It was formerly held that there was no beneficial occupation in the case of lands used for local public purposes; but that doctrine has been upset by recent decisions, and it is now established that the local authority itself must in general be taken into account as a possible tenant, to whom the occupation may be beneficial if not profitable. In other words, even here the statutory test may be applied, for it might be worth while to pay a rent for what it is necessary or beneficial to have, without reference to pecuniary profit or loss. The Council would, in fact, be willing to pay more rent rather than forego this park, which is valuable to the public for the purposes of recreation. The Court, therefore, held that the Council must be rated for the park and premises in one assessment, and they sent the case back again to value their beneficial occupation upon certain stated principles.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

J. J. B.—House.—Windows.—Liability.—Broken windows would be damages to the premises which the tenant must make good, and for which he would be legally liable, quite apart from any question or agreement as to repairs.

◆

The returns at the Auction Mart, Tokenhouse-yard, are improving. The aggregate for last week was £66,683.

At the Southwark Police-court on Thursday in last week George Baxter, of 1, Frederick's-place, Old Jewry, was fined £5 and costs, at the instance of St. Olave's Board of Works, for having defective drains at 10, Curley-street, Southwark.

At the Manchester Consistory Court on Friday a faculty was granted to take down the east wall of St. Mary's Chapel-of-Ease, Todmorden, and to build a new chancel; to build a vestry and organ-chamber on the south side of the chancel, to form a choir vestry and parish room under the chancel, to rearrange the heating apparatus, to turn the lower part of the tower into a baptistery and to place a new font therein, and to build a porch to protect the present door of the nave.

The foundation-stone of St. Mark's new schools, in Great Brickkiln-street and Humber-road, Wolverhampton, was laid on Thursday in last week. The existing schools were provided in 1848 at a cost of £1,500, and accommodate 480 children. They are, however, deemed inadequate by the Education Department. A site of 2,400 square yards was purchased from Lord Barnard for £233, and the new schools, which are to accommodate 570 children, will cost £2,500. The contract is held by Mr. H. Gough, and the architect is Mr. J. Lavender.

LEGAL INTELLIGENCE.

The New Railway to London.—Compensation Case.—At the London Sheriff's Court, Bloomsbury, on Tuesday, before Mr. Under-Sheriff Burchell and a special jury, the case of "Johnson v. the Manchester, Sheffield, and Lincolnshire Railway Company" came on for hearing. Mr. W. Ed. Johnson, dentist, of Newton Lodge, Finchley New-road, St. John's Wood, claimed from the railway company £2,205 as compensation for the destruction of his premises due to the construction of the Manchester, Sheffield, and Lincolnshire Railway Company's extension to St. John's Wood. For the claimant, Sir J. Whittaker Ellis estimated the damage at £1,300, and it is stated that the Board of Trade estimate was £520. The jury viewed the premises, and at the conclusion of the case assessed the damages at £1,000.

CHIPS.

The plans of the new baths and gymnasium, which Mr. Thomson Paton, of Norwood, has agreed to erect and present to the town of Alloa, have been passed by the Dean of Guild Court, and the work will be proceeded with shortly.

The town hall for West Ham, in Stratford Broadway, is undergoing renovation and redecoration under the supervision of Mr. Lewis Angell, the borough engineer, at an estimated cost of £1,900.

At Delabole granite quarries an important departure—or, rather, extension—is about to be made in the manufacture of "slate bricks."

The corporation electric-lighting station and installation in the streets at Stafford will be formally inaugurated by the mayor on Tuesday week, the 15th inst.

At the annual meeting in London of the South-West Africa Company, on Friday, the chairman said that already 315 miles of the proposed railway from the coast to Bechuanaland had been surveyed, and the country appeared to present no engineering difficulties whatever.

Mr. James Mansergh, M.Inst.C E., is to receive from the city council of Toronto a fee of £3,000 for his report on the waterworks system of the city, which will take him a month to complete.

At the West U.P. Church at Kinross, a new organ, designed and built by Messrs. C. and F. Hamilton, of Edinburgh, was opened on Sunday.

At a meeting of the committee of the Sunday Society, at the Prince's Rooms, on Monday night, Professor Corfield in the chair, letters were read from 44 clergymen and Nonconformist ministers, promising to preach on Museum Sunday, Nov. 3, while the Council of University College and the Governors of Dulwich College wrote to say that their art collections would be opened to the members of the society on the occasion. Upwards of 80 museums, art galleries, and libraries will be open on this year's "Museum Sunday."

The picture by Mr. Phil. Morris, R.A., which was exhibited at the Royal National Eisteddfod, held at Carnarvon last year, and which represents Edward I. showing his infant son to the Welsh people, has been purchased by public subscription, and placed in the public library of Carnarvon.

The magistrates of Sheffield have refused to license the Empire Palace of Varieties, which has just been erected in the city, to accommodate an audience of 3,500 people, and at a cost, including the site, of £65,000. The theatre, which has frontages to Pinstone, Union, and Charles streets, is faced with red bricks and stone. Mr. Frank Matcham, of London, was the architect, and Messrs. Longden and Son, of Neepsend, Sheffield, were the contractors.

Several archæological discoveries have been made at Monkswood, near Bath, where a reservoir is being constructed to supplement the water supply of the city. An iron hatchet has been found in the peat, with a handle formed of a human leg bone. Round the socket is a rough ferrule of lead. The metal head was kept firm by means of wooden plugs, traces of which were found clinging to the iron. Oolitic flint hammer-heads and an interesting collection of bronze weapons and articles of personal adornment have also been brought to light. These discoveries have been inspected by Professor Boyd Dawkins. The excavations are in the charge of Mr. Charles Gilby, city engineer of Bath.

A private meeting of the Wolverhampton Town Council in committee was held on Monday to consider the report which had been prepared by the borough engineer, Mr. Bradley, with regard to the substitution of the waste-water closet for the pan system. It is estimated that the conversion will cost about £30,000, and the General Purposes Committee recommended that the change be made. The question was discussed for over two hours, and ultimately it was decided to refer the matter to the committee again for further information to be obtained.

WATER SUPPLY AND SANITARY MATTERS.

Birmingham.—At their meeting, on Tuesday, the city council of Birmingham authorised the water committee to promote a Bill in Parliament empowering the corporation to acquire sites for the deposit of spoil from the aqueduct works in connection with the Welsh scheme, and to construct a line of railway from Rubery Station to the site of the proposed reservoir at Frankley. It was explained that, when the reservoir was first projected, Mr. Gray, then the water engineer, was of opinion that a sufficient quantity of clay would be found on the site to make the lining, even if the soil was not of such an impervious character as not to require lining; but when Mr. Mansergh sank a number of trial holes, it was found that the quantity of clay there was comparatively small, and the quality was not of such a character as to encourage him to use it. It had therefore been decided to line the reservoir with concrete, with a surface of asphalte. For this some 200,000 tons of stone would be required, and it would have to be brought from two quarries in the neighbourhood of Rubery Station. A railway would therefore bring the material at a far less cost of haulage than would be entailed by haulage with carts. It would also be available for the bricks, the ironwork, and machinery for the pumping machinery, the sand for the filter-beds, and the coal for the pumping.

East London Water Supply.—The inquiry directed by the Local Government Board into the causes of the deficient supply of water to the inhabitants of East London during June, July, and August was opened on Tuesday at the Hackney Town Hall. Among the witnesses called were several medical officers of health. Dr. Warry, of Hackney, said the death-rate of that district rose above the average of the rest of London, and there was nothing to account for this but the want of water. Counsel for the East London Water Company admitted that a constant supply had had to be replaced by an intermittent one; but said this was due first to the drought, and secondly to the obstruction of the Company's Bill in Parliament. On Wednesday, Dr. G. P. Bate, medical officer for Bethnal Green, said that in June, July, and August there was a great scarcity of water, and an increase in the rate of mortality. Dr. Taylor, medical officer for Mile-End, and Dr. V. Rygate, medical officer for St. George's district, gave similar testimony. Mr. F. W. Barrett, surveyor for Bethnal Green, said there was enormous waste of water through the negligence of the company. Mr. James Lovegrove, chief surveyor to the Hackney Vestry for the past 39 years, stated that between Jan. 1 and April 30 this year there were 1,536 permits applied for by the water company to open the roadway for the repair of their pipes. In the same period for 1893 there were 514 applications, and in 1894, 509 permits were granted. The average depth of the mains varied from 1ft. 6in. to 3ft. In Terrace-road there was a 4in. main, which was at a depth of 1ft. 9in. Mr. J. M. Knight, for the past 27 years surveyor to the Mile-End Vestry, Mr. Dawson, surveyor for the Leyton district, and a number of sanitary officers of the various East-end parishes spoke to the serious inconvenience experienced by the poorer population through the deficient water supply. The case for the petitioners having closed, the Court adjourned.

Edinburgh.—The New Talla Water Supply.—The Edinburgh and District Water Trust carried out on Saturday the inauguration ceremony that signalises the commencement of the great undertaking by which the Talla, one of the head-waters of the Tweed, is to be made available for the supply of an ever-increasing population. The party proceeded by rail to Broughton, near Peebles, whence an eight-mile drive along Tweedside took them to the portion of the Talla and Tweed where the first sod was turned. The trustees will facilitate the operation of raising their embankment across the valley of the Talla by constructing a permanent railway down Tweedside to Broughton, and a permanent bridge to carry the railway and pipes will be thrown across the Tweed at the site selected for the inaugural ceremony. The present scheme is designed to afford a supply of twenty-four million gallons of water per day. A first instalment of eight millions per day is to be drawn from the Talla, and fifty million gallons per day will ultimately be obtained, which will supply a population of 1,250,000 in addition to the present population of 387,000, allowing forty gallons per head to each person. Mr. Wilson is the engineer, and Messrs. James Young and Sons are the contractors.

Leeds.—The corporation of this city have under consideration a report by the sanitary committee recommending that an application be made to the Local Government Board under the Housing of the Working Classes Act, 1890, for powers to take over, demolish, improve, and otherwise deal with one-third of an insanitary area in East Leeds. The portion selected is bounded on one side by the whole of Marsh-lane and part of Kirkgate, and on the other by High-street and Dyer-street, and comprises Duke-street, Off-street, Brussels-street, Stainburn-square, Sykes-place, and St. Peter's-square, and it is estimated to contain 78,795 square yards. There are several mills and manufactories within the boundaries above named, and these will not be interfered with, but it is proposed to make a wholesale clearance of the house property, and to improve the locality by constructing a number of fairly wide streets, in order that the new cottages to be afterwards built may be supplied with as much fresh air as possible.

Newark.—At the invitation of the mayor of Newark the members of the Corporation have paid a visit of inspection to the new waterworks at Farnsfield. Mr. Rolfe, engineer, accompanied the party, and explained the working of the various parts of the scheme. The town of Newark and the outlying villages, which are taking water from the corporation, are being supplied at present by temporary machinery, but the permanent plant is fast nearing completion. The two beam-engines which are being erected were explained by Mr. Rowe (representative of Messrs. Watt and Co., the makers). They will run at 16½ revolutions a minute, each pumping a million gallons per 24 hours. There are three boilers of large dimensions, and the water has to be forced from the works to Newark and Balderton, a distance of 12 to 14 miles. All the buildings, engine-sheds, walls, reservoirs, workmen's cottages, &c., are now completed. The entire cost of the undertaking has been about £56,000.

Mr. Edward Smith, the Master of the Carpenters' Company, will distribute the prizes to-day (Friday) to the students of the architectural classes held at King's College, Strand, under the direction of Professor Banister Fletcher and his son. The Rev. Henry Wace, D.D., will preside.

The Birmingham Arts Club closed its doors on Saturday night, and its rooms are now in possession of the bailiffs. Besides the landlord, several tradesmen have claims against the committee. The club was opened five years ago with a membership of 700, but owing to loss of interest of members, the number on the roll has been reduced to comparatively small dimensions. The Arts was unique in Birmingham club life, inasmuch as it was the only one that was open on Sundays.

The unveiling of the memorial to the late Primate of Ireland, the Most Rev. Dr. R. B. Knox, which consists of a portrait bust by Mr. Joseph Whitehead, and is to be placed in a carved marble niche, takes place in Armagh Cathedral on Monday next.

The annual scholarship of the Royal Drawing Society has been awarded to Miss P. T. Pawson, of the Sutton High School.

At the forthcoming inauguration of the new University buildings at Aberdeen, it is proposed to confer the honorary degree of LL.D. upon Mr. Alexander Ross, architect and antiquarian writer, Provost of Inverness; and on Mr. Cecil Harcourt Smith, department of Greek and Roman archæology, British Museum.

The nineteenth annual report of the School of Drawing and Painting of the Museum of Fine Arts at Boston, Mass., shows a very satisfactory condition of affairs. During the past year 214 pupils were enrolled on the school lists, and the treasurer's accounts show a balance of receipts over expenses. The pupils come mainly from New England, but some were drawn from Wisconsin, Illinois, and Michigan.

Plans have been prepared for the extension and improvement of the North British Railway Station at Craigendoran Pier, Helensburgh, the starting-point of the railway's fleet of Clyde steamers. Provision will be made for another pierhead platform, and for extra coal sidings. It is also proposed to enlarge the quay accommodation by extending the quay further seawards.

The French Budget Committee, who are retrenching vigorously in view of the outlay in Madagascar, propose to sell the building in the Place Vendome for about £125,000. The Hôtel des Invalides is now to be used in the future as a home for veterans.

The opening of the Medical Session on Tuesday was marked at the Medical School attached to the London Hospital by the formal presentation to that institution of a subscription portrait of Dr. J. Hughlings Jackson, F.R.S., painted by Mr. Lance Calkin.

Mr. Alderman William Powell, the Mayor of Basingstoke, was entertained at dinner in the drill-hall of that borough on Tuesday night in last week, when he was presented with a chiming clock, cruet, inkstand, and other plate, subscribed for by upwards of 650 inhabitants, as a mark of appreciation of the manner in which he has discharged the duties during his year of office.

Our Office Table.

The forthcoming publishing season is to include the following works due to the enterprise of Mr. T. B. Batsford, who hopes to have out his folio of collotypes illustrating "London Churches of the Renaissance Period," chiefly from the City, with descriptions written by Mr. Geo. H. Birch, F.S.A., the Curator of the Soane Museum. Mr. Lewis F. Day is the author of a fully illustrated work on Decorative Glass; Mr. Anderson, of Glasgow, is doing a students' book on "The Renaissance Architecture of Italy"; and "Plastering, Plain and Decorative," is the title of another textbook with 50 plates which ought to be interesting. "The Architecture of the Later Renaissance in England," in similar form to Gotch's big folio, is in course of preparation, under the direction of Mr. J. Belcher and Mr. M. E. Macartney. Mr. Batsford has also a series of photographs in hand of the "Payre" and other collections of woodwork, to be issued in portfolios. This, if really done well and to scale, showing the detail of the ornament clearly, may depend upon an appreciative number of subscribers.

The following were the resolutions passed at the Firemen's International Congress held last week at Amsterdam:—(1) Proposed by M. Bruyn, of Amsterdam.—"The flash-point of mineral oils to be above 40° (test Abeli)." (2) Proposed by Mr. Edwin O. Sachs, of London.—"It is part of the duties of fire departments to see to minimising the water damage at fires, and each fire department should have its own salvage section." (3) Proposed by M. Huygen, of Rotterdam.—"That insurance companies should lessen their rates for public buildings supplied with some central systems of heating." (4) Proposed by Mr. Edwin O. Sachs, of London.—"That the good planning of theatres is of more importance to the audiences than the materials of which they are made, and that permanent fire-watchers in theatres are of more importance than regular official inspections." (5) Proposed by M. Cacheux, of Puys.—"That public authorities should insist on householders having means of self-help in case of fire."

Some particulars of the work already accomplished by the London Survey Committee are furnished by the secretary, Mr. Ernest Godman, of Essex House, Bow, in the current issue of the *A.A. Notes*. The object is to prepare a register of the old and interesting buildings of Greater London and Suburban Essex, and to publish an illustrative series of monographs with plans and measured drawings of some of the principal remains. Since the commencement of the work in May, 1894, the Survey Committee have visited, for the purpose of recording in the Register, some two hundred houses and buildings of interest in the district east and north of London, within a distance of about twelve miles from it. The collection of sketches, photographs, and drawings already made numbers close on three hundred, and is open for the inspection of any who may wish to see it. The actual Register, which will contain the record of work done, together with reproductions of the most important of these illustrations, will, it is hoped, be ready for publication in the course of a few weeks. After the completion of this first part of the work, it is proposed to extend the survey to the district of Chelsea and neighbourhood, and to form a local committee having its centre at Chelsea.

The School of Art Woodcarving, Central Technical College, Exhibition-road, South Kensington, has been reopened after the usual summer vacation, and we are requested to state that one or two of the free studentships in the evening classes, maintained by means of funds granted to the school by the City and Guilds of London Institute, are vacant. To bring the benefits of the school within the reach of artisans, a remission of half fees for the evening class is made to artisan students connected with the wood-carving trade. Forms of application for the free studentships and any further particulars relating to the school may be obtained from the manager.

The work of excavating the Roman city at Silchester, which is being gradually proceeded with as funds permit, has yielded very interesting results during the present season. The digging has this year been confined to a block of buildings between the Basilica and the West Gate. This space was occupied by two large buildings, which were probably the residences of two of the chief citizens. Both houses had apartments for summer and winter use, the latter being warmed by a system of hot-air passages. The well-wrought tesselated pavements in the summer apartments are in excellent preservation. None of the tesseræ are more than ½in. square. Fragments of the glass from the windows and pieces of the coloured plaster from the walls have been found, as well as a bronze stylus, spoons, tweezers, and fibulæ for the clothes, of excellent workmanship; many coins, pieces of the rare highly-glazed Samian pottery ware, the black ware from Upchurch, variegated pottery from Caistor; steel-yard weights, and portions of mortars.

A difficulty has arisen respecting the erection of the new building of the Royal Alexandra Children's Hospital and Convalescent Home at Rhyl, the foundation-stone of which was laid in July, 1894, by the Princess of Wales. The proposed new building, which is to cost £15,000, is to be erected from plans by Messrs. Waterhouse and Son, of London, on the site of the old hospital which stands on the Promenade at Rhyl. For a long time past the local authority tried to induce the hospital committee, of which the Duke of Westminster is a member, to erect the building on another site, so that the Rhyl sea-front might be clear of obstructions; but failing in this, they negotiated to have the building set back. Fresh difficulties have now arisen, and the owners of property near the hospital will avail themselves of every legitimate means to prevent the hospital being re-erected on the sea front. The urban district council and the owners of property have twice petitioned the Duke of Westminster to use his influence to have a new site selected, and now await his reply.

An appeal is being made by the Vicar of Dedham for £500 for the restoration of the noble tower of his parish church, well known to all lovers of Constable's paintings, and the principal feature in the landscape of the Vale of Dedham. A report has been received from Mr. J. T. Micklethwaite, F.S.A., of Dean's-yard, who states that the roof is in a very bad condition, the massive timber-work upon which the stability of the tower depends being much decayed. The stonework of the four great windows, and also that of the smaller ones, is very dilapidated, the oak louvre-boards and framework need repair. The cracks in the walls, which are an old trouble, show signs of widening, and must be dealt with at once. If the work is not speedily executed it is alleged serious disaster may result. The fabric of the church, nave, aisles, and clerestories has been completely repaired within the last ten years, and upon the interior and exterior work the parishioners themselves have spent £1,650.

At the last session of the Edinburgh Dean of Guild Court, plans were submitted for the new chimney which is to replace the well-known shaft 329ft. high now existing at New-street gas-works. It was explained that the engineer now proposed to erect a flue 250ft. in height, the first proposal to carry it up only 160ft. not giving sufficient draught. Dean of Guild Miller said the position in which the commissioners now proposed to put the chimney was a good deal better than the former one. The Court did not wish to delay the construction in any way, but they thought that a chimney 200ft. high might be sufficient. Another point was, that there was no reason why it should not be a handsome chimney. It would be conspicuous, and the Court strongly urged the Gas Commissioners to employ an architect, and give it a little more architectural character. That would not cost much, and it would improve the chimney immensely. In the meantime, the Court would grant warrant to build up to the first intake. Mr. Masterton, for the commissioners, agreed to lay the suggestions of the Court before the commissioners, it being explained that the portion for which warrant was granted was 20ft. or 30ft. in height, and would take several weeks to build.

Some useful remarks are made in an article on "Surveying and Mapping a City," by Mr. C. H. Rice, in the *Engineering Magazine*. Speaking of triangular systems, Mr. Rice refers to the bases or measured lines used at Baltimore, two in number; these were measured with a tape 300ft. long, supported on pulleys at intervals of 20ft. "The pulleys were hung on wooden supports, carefully set in line and grade. The tension was measured by spring balances, and the temperature read at three different points on the tape every time it was suspended. The constants for the tape, its length at a standard temperature (62° Fahr.), rate of expansion per degree, &c., were determined by comparison with the Mount Royal standard. The work was done at night, to reduce the temperature correction to as small a quantity as possible. Each base-line was about 7,000ft. in length." The writer gives the many uses to which city maps may be put. A map on a scale of 500ft. to one inch, with contours every 5ft., is useful, and sufficient for street improvements, sewering, &c. Those on a scale of 200ft. to one inch would show all buildings and fences, and wood, grass, or cultivated ground. Real estate owners would make use of such a map, as well as engineers and architects, for street locations, drainage, &c. Maps 100ft. to one inch would show everything on the surface of ground—sewers, gas, water-mains, electric conduits, &c. Engineering problems could be worked out on them. Lastly, those drawn to a scale of 40ft. to one inch (24 streets to a square mile) would show even the ground plans of buildings, materials of which they are built, number of stories, owners' names, and would be invaluable to all architects and house-agents.

The inauguration of the scheme for cutting a ship canal from Bruges to Heyst, was celebrated with many festivities on Sunday. The canal, which is to be constructed for the Belgian Government, will be six miles in length, and will be cut in a direct line from Bruges to Heyst, a village 14 miles north of Ostend. It will accommodate vessels of 6,000 tons register, and on either side will be flanked by a railway, also laid at the cost of the State. At Heyst an absolutely new port will be constructed on a scale large enough to accommodate at one time from 12 to 15 of the largest Atlantic steamers, and it will be protected by a breakwater, already commenced, and will stretch some two miles or more into the sea. The contract for the canal works has been taken by Messrs. Coiseau and Cousin, at about £1,560,000 sterling.

Work has just commenced on the Seattle and Lake Washington Canal, which is to connect the Puget Sound with the fresh water lake, Lake Washington. It includes the excavation of two waterways, each about one mile long and 1,000ft. wide, from deep water through the tide flats of Elliott Bay; two waterways connecting the east and west waterways with the mouth of the west channel of the Duwamish River; a canal waterway about one mile long and 218ft. wide, from the head of the east waterway to the shore line; a canal through the upland 80ft. wide at the bottom, in a direct line nearly two miles to Lake Washington, and the filling to a level of 2ft. above high tide of 1,525 acres of tidal land with the excavated material. The two main waterways and the canal are to be excavated to a depth of 26ft. at low tide, the canal itself to 30ft., and the Duwamish waterways to 12ft. The amount of material to be excavated is 36,000,000 cubic yards, just about enough to do the filling required. While the east and west waterways will be 1,000ft. wide, the space clear from traffic will be only 552ft. between the pier head lines, the remaining 448ft. being allowed for the extension of wharves and slips.

The inauguration of the great bridge over the Danube connecting Tchernavoda with Fetesti took place on Sept. 26th. The work has been completed within five years and a half, having been begun in 1890. Its construction has been superintended by M. Saligny, the inspector-general of Roumanian railways. The total cost of the work amounts to £1,350,000 sterling. The structure consists of three viaducts and two bridges properly so called. The principal bridge crosses the main stream of the Danube at Tchernavoda, while the other spans an arm of the river called Borcea am Fetesti. The two bridges are connected by a viaduct and an embankment running across the Island Balta, which is submerged at high water. The two other viaducts form approaches to the main bridge from either side and are rendered necessary by the height of the structure and by inundations to which the country on either side is liable. The superstructure of the bridges is of steel, with cantilevers resting on gigantic piers. The height of the principal bridge is 95ft. above high-water level, thus leaving navigation free for the largest vessels. The height of the smaller bridge is 40ft. The foundations are laid on piles driven to a depth of from 38ft. to 70ft. below the bed of the river. The viaducts are of masonry. Their combined length is 9,300ft., which added to 6,625ft., the length of the two bridges, gives a total length of 15,925ft., or a little over three miles.

As a result of nearly 40,000 tests of timber made at the laboratory of the Washington University at St. Louis, under the direction of the forestry division of the Department of Agriculture, the following facts have been determined: Seasoned timber is about twice as strong as green timber, but well-seasoned timber loses its strength with the absorption of moisture; timbers of large sections have equal strength per square inch with small ones, when they are equally free from blemish; knots are as great a source of weakness in a column as in a beam; long-leafed pine is stronger than the average oak, and bleeding timber does not impair its qualities.

By the merest accident (an American journal remarks) the cause of an acoustical defect, which had been attributed to faulty construction, was recently discovered in Trinity Church, Pittsburg, Penn. A magnificent organ had proved a disappointment, there being a lack of volume and a slightly muffled effect. This was ascribed to the position of the organ. It recently happened that the church was undergoing a thorough repairing and cleaning. The ingrain carpet and padding had been taken up. It was then noticed that the volume of sound from the organ was increased, and that the muffled sound had entirely disappeared. The cause was thus, to the surprise of all, discovered to be in the carpet. A narrow strip of matting, or tiles, will be substituted for the carpet in the aisles. Perhaps the defective acoustics in other buildings may be found to arise from a similar cause.

◆

Sir Benjamin Baker, the president of the Institution of Civil Engineers, has been elected as one of the three trustees of the benevolent fund attached to the Institution, in succession to the late Mr. Alfred Giles, a past president, and formerly M.P. for Southampton.

The Harrogate Town Council resolved, on Tuesday, to borrow £23,500 for works and plant for the electric-light installation, and £1,500 for street lighting. It was also decided to borrow £1,500 for the construction of an underground lavatory and conveniences on the Stray, on Prospect-hill; £150 for additional sanitary conveniences in the Victoria Baths; £4,000 for the construction of ten additional reservoirs for storing sulphur water; and £3,000 for the purchase of land in Beckwith, for obtaining therefrom a further supply of sulphur water—altogether a total of £36,500.

The Mayor of Brighton laid, on Wednerday, the foundation stone of a technical institute, which is to be erected in that town at a cost of £26,000. The Brighton Corporation is now training in technical knowledge 1,100 scholars in various schools.

Saxby Parish Church, Lincolnshire, was opened, after renovation, on Thursday in last week. This is one of the few Georgian churches in the neighbourhood. It is built with the Roche Abbey stone, which was second in selection for the Houses of Parliament.

The proposed extension of the promenade was again before the Blackpool Town Council on Tuesday, and. after a discussion, it was decided that a sum of £20,000 be expended in commencing a scheme for widening the carriage drive seawards to an extent of 60ft., the first section to be at the South Shore.

Mr. Scaping, of Grimsby, is the architect of the extensions now being made to the Heneage and Welholme Board Schools in that town, and estimated to provide 600 and 480 additional school places respectively.

The urban district council of Rugeley decided, on Tuesday, to offer a sum of 50 guineas as a premium for the best scheme for the disposal of the sewage, the present sewers as far as practicable to be utilised and properly ventilated. The premiums are to be merged in the sum paid for carrying out the scheme should the author be appointed as the engineer.

Mr. R. Walton, an inspector from the Local Government Board, held an inquiry at the town hall, Halifax, on Tuesday, relative to an application from the Halifax Town Council for powers to borrow £11,000 for street improvements in Pellon-lane, Bull-green, Skircoat Green-road, Bull Close-lane, Carlton-street, and Blackwall. There was no opposition to the proposals.

Mr. Walter Money, F.S.A., of Newbury, writes to point out the injury done to church towers by change-ringing on the peals of bells. The performance is, he says, merely a mechanical one, and quite foreign to the original purpose of these ancient heralds of the church.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Engineers. "Relative Value of Percolation Gauges," by Reginald E. Middleton. United Service Institution, Whitehall. 7.30 p.m.
Liverpool Architectural Society. Opening address by the President, Alfred Culshaw. 7 p.m.
Tuesday.—Sheffield Society of Architects and Surveyors. Opening conversazione. Address by the President, Chas. Hadfield.
Friday.—Architectural Association. Annual meeting. Address by the President, W. D. Caröe and presentation of prizes. 7.30 p.m.

CHIPS.

The Alexandria Municipal Museum was opened on Friday by the Khedive.

The Bristol Town Council discussed for over three hours on Friday the Docks Committee's proposals for constructing railways to the timber-yards, and crossing the river by railway and foot-bridges; also for providing coal-tips. A motion was made to postpone action until Mr. Wolfe Barry's report on river improvements was forthcoming; but this was rejected by 34 votes to 17, and the committee's report was then adopted without a division. The remaining part of the committee's scheme, dealing with additional accommodation for pleasure steamers, was adjourned till Monday, when, after much discussion, it was also adopted.

A proposal is to be submitted to the Hull Town Council for the erection of cold storage buildings near the Alexandra Dock, at a cost of about £40,000.

A new hall has been added the Connaught Institute, in Lewes-road, Brighton, at a net cost of £3,650. It accommodates 1,200 persons, and has a frontage to Melbourne-street. Mr. J. G. Gibbins is the architect, and Mr. William Willett the builder.

The parish church of Ingworth, Norfolk, is undergoing re-roofing and other restorations from plans by Mr. Herbert Green, of Norwich. Mr. R. W. Riches, of Postwick, is the builder. Funds will not permit of the rebuilding of the tower, which fell many years ago, so it is proposed simply to repair the bellcote on the western gable.

The Bishop of Durham performed the rededication service of the parish church of Stockton on Friday. The present stage of the restoration scheme has been completed at a cost of £3,000.

The Hanley Town Council decided on Tuesday, by 13 votes to 8, "that no contracts for corporation work be given to firms paying less than the standard rate of wages of their district, and that the same be notified when advertising for tenders."

A stained-glass window, representing the Annunciation, has been placed in the south aisle of Preston Candover Church, near Basingstoke, which has also been enriched with a second three-light window containing figures of Noah, Daniel, and Job, and with a font-cover of wrought-iron work. The above windows, as well as the rest in the church, were designed and executed by Messrs. Heaton, Butler, and Bayne, of Garrick-street, Covent Garden, and the font-cover is by Messrs. Shrivell and Co., Castle-street, Long-acre.

Mr. John Lysaght, the proprietor of the extensive galvanised iron and spelter works at Bristol, and also of the Swan Gardens Ironworks and the Roller Mills at Wolverhampton, employing in all 2,700 hands, died on Tuesday at his residence at Springfort, Stoke Bishop, at the age of 64, after a throat affection lasting over twelve months. He was a magistrate for Bristol, and in 1883 served as high sheriff, and was more widely known as a yachtsman.

Colonel Coke, M.I.C.E., Local Government Board inspector, inspected, on Wednesday week, the water supply and sewerage schemes which, at a cost of £3,000, are being carried out at Hatherleigh, and which are now approaching completion.

The memorial stones of a new Baptist chapel, which is to be erected at Stoke St. Gregory, West Somerset, were laid on Thursday in last week. Mr. Pople, of Burnham, is the contractor, and the outlay will be £1,500.

It is proposed to restore the parish church of St. Paul, Deptford. Towards the £2,000 wanted over £1,300 has been subscribed.

Mr. Jabez Lowes Sears, for years a well-known architect of Boston, Mass., died at Brookline on September 15.

A stained-glass window, representing the Good Shepherd and the Good Samaritan, has been placed in the chancel of Brewood Church.

A new vicarage is in course of erection in connection with Holy Trinity Church, Birchfield, near Handsworth. The builder is Mr. George Trentham, whose tender was accepted at £1,614.

At Aberdeen, on Friday, the Plans Committee of the Town Council sanctioned plans of new buildings to the value of £4,000.

Trade News.

WAGES MOVEMENTS.

Falkirk.—As a result of the strike among Falkirk joiners, the masters are placing orders with wood merchants in Bo'ness who turn out manufactured goods. The strikers are consequently making efforts to get the Bo'ness joiners to stop work.

◆

Lord Wolseley will open the new rifle range provided for the Nottingham regiment of Volunteers (the Robin Hoods) on Thursday, November 7. The range adjoins Trent Station, on the Midland Railway, about midway between Nottingham and Derby, and is the first provided under the Military Lands Act, 1892. The Nottingham Corporation obtained the sanction of the Local Government Board for a loan of £16,000 to cover the cost of the land and the building of the range. Messrs. Brevill and Bailey were appointed the architects, Major Brevill being an active officer of the battalion, and the range, with the necessary buildings, is now approaching completion.

Backed by the grant of no less than a hundred and thirty lakhs of rupees, or more than a million and a quarter sterling at par, Mr. Lee Pogson, C.E., has at last succeeded in giving the port of Madras a still and deep harbour for the second time. The first was washed away by the cyclone of November, 1881, after it had cost more than half a million sterling. Since 1885 Mr. Lee Pogson has been carrying on the instructions of the local government and the Secretary of State for India, and has now created a haven, protected by two piers of concrete blocks which run out into the Bay of Bengal for about 4,000ft., with an eastern entrance 515½ft. broad, and inclosing a depth of 39ft. of peaceful water.

The building committee of the Congregational church about to be built in Hartington-road, Liverpool, have resolved to accept the tender of Messrs. Paterson and Son, and Messrs. Hay, the architects, were instructed to make arrangements for the commencement of the work. The church, which will accommodate about 500 people, consists of nave and transepts, with apsidal east end containing vestries and organ-chamber opening out with large arch into the body of the church, the whole terminating at the west end in a spire. The exterior of the building will be faced with Doulton's pressed brick with freestone dressings. The amount of the accepted tender is £3,079.

The first sod of the Budleigh Salterton Railway will be cut in about a fortnight's time by Lady Gertrude Rolle. The contract has been placed with Mr. John Aird, of London. The contractor, accompanied by Mr. Chamier, agent of the Rolle Estate, went on Friday over the route which will be taken by the line, and the contractor has made the necessary arrangements for getting his plant on the spot at once. The work of construction will be simultaneously commenced at both ends.

A new highway bridge is being built at Iddesleigh, spanning the river Ochmont. The contract has been taken by Messrs. Ash and Son, of Sampford Courtenay, and the cost is borne in equal proportions by the parish council, the Okehampton rural authority, and the Devon County Council.

At the Lancaster Brewster Sessions on Friday a provisional license was granted for an hotel on the Moorlands estate, which is now in course of erection. It was stated that on the estate there was provision made for 555 houses, that 97 were now inhabited, 201 were in course of erection, and the population in the immediate district was 2,130. The house will replace, so far as licenses go, the Feathers Hotel, which is about to be demolished by the corporation in carrying out the widening of China-lane.

A report on kitchen boiler explosions was presented on Friday by the General Purposes Committee of the Manchester City Council. It was agreed to request the Lord Mayor of the city to bring the question before the Council of the Municipal Corporation Association, with a view to bringing all domestic boilers within the scope of the Boiler Explosions Act.

The ceremony of opening the Barrack Park, which has been acquired from the Earl of Home for the community of Dundee, took place on Saturday. The acquirement and laying-out have involved an expenditure of some £30,000.

In restoring the Crown Point Printing Works at Hunslet, Leeds, which were destroyed by fire in September, 1894, Mr. Alf. Cooke has had erected a large tower clock. It is illuminated by night, and is fitted with Westminster chimes, the weight of the bells for chiming and striking aggregating two tons. The new clock, which has cost £300, is triple-faced, the dials being 5ft. 6in. in diameter. It has been manufactured by Messrs. Evans and Sons, of Handsworth.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2127.

FRIDAY, OCTOBER 11, 1895.

THE STREET WE ARE TO WAIT FOR.

BUSINESS is reviving, and the County Council's postponed undertaking would most certainly have revived it more. London, of course, is the place, and building is the trade which might have been expected to profit most. But had the scheme gone on without further delay, it would have brought up labour from the provinces, and helped to employ the multitude of provincial labourers who have come up already. Few of them, probably, know much about building. They are, in great part, the men who used to plough, and sow, and reap when English harvests were worth having. Thrown out of employment by the ruin of agriculture, they have been driven to the towns as the only alternative to the workhouse—and there is reason to fear that they have been faring badly. Their labour is what townspeople call "unskilled"—as most people's labour would be if they were taken away from the trade they had learned and set to exercise one which had no relation to it. Skill is relative, and the London street boy attempting to hoe a row of turnips would cut quite as poor a figure as the village lad trying to find his way, say, across "the rather difficult country," as Mr. Eugene Wrayburn called it, "about Bethnal Green." Unskilled labour, however, is largely wanted in the making of a new thoroughfare. There is a quantity of rough work implied in it, especially in its earlier stages; the skilled artisan gets his turn a little later.

There is much to be said in favour of the scheme which was definitely put before the public ten days ago. A new route—if the word "new" is not superfluous, for at present there can scarcely be said to be a route at all—between Holborn and the Strand could hardly go where it did less damage. The Olympic Theatre would come down, and Wych-street would probably be closed. There, and in the middle row between Holywell-street and the Strand, we should lose some vestiges of Old London. But, considering the character of these localities, and remembering also the paint and compo, the enamelled skins, the making "beautiful for ever," which have long disguised the ancient houses they contain, we could manage to reconcile ourselves to their removal. Mr. Ernest George, in an etching of which some years ago we published a photo-lithograph, has preserved a faithful likeness of modern Wych-street at its best. With a glimpse of St. Clement Danes' tower at the end of it, it makes a very picturesque and successful drawing, but for all that, Wych-street, for many years, has been better on paper than in reality. It is with art as with love, "Things base and vile, holding no quantity, Can art transpose to form and dignity," and the charm of this particular etching is rather due to its sketcher than its subject. We rejoice that no interference was proposed with the two churches of St. Clement Danes and St. Mary-le-Strand. With the aid of these important features, the junction of the proposed avenue with the Strand might be made one of the finest things in London. If it could but be kept out of the hands of the speculative builder, and what is almost worse, of the speculative architect, we might have a success which would blot from memory the Shaftesbury-avenue Circus, and half atone for the costly failure in Piccadilly. A primary necessity is that the new buildings at the junction should be comparatively low. It does not follow that there should be no lofty features here and there amongst them. But their general masses should not much overtop Somerset House nor at all dwarf St. Mary's tower. Yet who is to see that they do not? And who could be trusted, even if they were given the power, to exercise a wise discretion about what designs were or were not allowable in such a situation? To refer this to the Institute would probably mean one of two things. Either it would fall into the hands of the "building negotiants"—the surveyors who get so much architectural work for which they are quite unfit, and who do it so badly—or it would be settled by a tribunal of past-presidents, vice-presidents, and the like, out of whom perhaps two in ten would be the right men in the right places. Even without such a tribunal, we fear it would be hard to get the County Council to agree on a limit of height. Such a limit implies some loss of money, though little enough in comparison with the whole cost of the scheme; and the modern Englishman is generally ready to spoil a ship when he can save a halfpenny-worth of tar. However, when the scheme goes on, if it ever does, we must make a fight for it. To keep the building negotiants at the business they understand, and to prevent the merely ornamental figures at Conduit-street from stepping off their pedestals, and blocking up the paths to improvement, are two objects well worth striving for. They will not be attained in a day, or a year; but no effort which brings us a little nearer to them will be wasted, and it may do something, if not everything, towards preventing another great public opportunity from being foolishly thrown away.

A graceful tower, like that of St. Mary's, would make a far more impressive centre for the proposed space than a mere drinking-fountain, like that in Piccadilly. Moreover, it is ready built for us, and will cost nothing. But the church it belongs to was never meant to stand bald and bare, quite away from other structures. It is too straight, too narrow, too unbroken to seem satisfactory so. Moreover, being still in use, its congregation, whether small or large, cannot conveniently be turned out on to the very margin of a crossing. How the County Council meant to deal with this part of the scheme we do not know. It seems imperative that a clear carriage-way should be left on both sides and at both ends of the church. From every quarter, therefore, a road—and a busy one—would have to be crossed to reach it or leave it. This forcibly suggests, for one thing, that a good space must be set apart for the church to stand on. It must have an island to itself in the sea of traffic, and this island might be planted with trees and flowers, so as to form a beautiful centre to the space. But even then it is rather awkward for a little crowd of people to issue from a public building into a position which they cannot possibly escape from except by dodging the cabs and omnibuses. For many years there has been a talk of light bridges at important crossings. By a light bridge, the engineer means one thing, and the architect another; and if the engineer's idea were adopted and set up, then farewell to any hope of a noble central opening in the Strand. But it is for the engineer, as it is for the building negotiant, to keep within his own province, and that province is not here. Some of us remember—as one of the most telling points in Mr. Street's first design for the Law Courts—the light stone arch which he proposed to throw across the street in place of Temple Bar. It was not erected. John Bull spent his million or so on the Law Courts; saved a few hundred pounds on this arch, which would have been the proper finish to them, and set up, instead of it, his beloved "Griffin." He spoiled his ship—but he saved his halfpenny. Still the result does not quite satisfy him. His conscience is partially awakened now, and he might perhaps be brought to consider the desirableness of building, not that same arch—for it was a Gothic one—but an arch equally architectural, to form a footway from St. Mary's Church to the nearest pavement. At Croyland there is a triangular bridge—a compound of three such arches. Certainly three footways above the three lines of traffic suggest themselves here; and if the thing fell into the hands of an artist, he could make of them something which other artists would come over the seas to paint, as they go over sea to paint the bridges of Venice. This, perhaps, is too much to hope for; and if the scheme fell into the hands of the building negotiant, as such things are apt to do, *one* bridge would be a great deal more than any of us could put up with.

St. Clement Danes, it may be said, is already shut off from the street pavements, and yet no such bridge seems wanted there. This, at present, is true. But, then, St. Clement's does not stand at the junction of three great streets. Practically, most of the traffic passes to the south of it. The roadway between it and the Law Courts is little used, and it is easy enough to reach the pavement on that side at any time. There will be a different state of affairs whenever the middle row which forms the south side of Holywell-street is removed. A full half of the traffic is then sure to pass on the northern side; but even with this alteration it will remain far less difficult to reach the pavement from St. Clement's than from St. Mary's. In the former case there will be only half a street to get over, for the vehicles going east are pretty sure to be kept to the north of the church, and those going west to the south of it. At the proposed semi-circus, if we may so name it, this can hardly be. The traffic will be passing St. Mary's in six different directions. There will be the carriages going east and those going west along the Strand. Then there will be those coming from the west to the new street, and those going west from the new street; and, lastly, those coming from the east to it, and going east from it. Crossings at circuses and junctions, moreover, are much more dangerous than those at right angles to a straight roadway. Omnibuses stand, one after another, close to the pavement and block the view. The passenger has to pass them, and get near the middle of the roadway, before he can see what chance there is of getting further. Very often there is no chance for a minute or two. While he is waiting, the omnibus which was behind him has moved on. It, or another one, has cut off his retreat, and he cannot step back, whatever happens. Then comes, perhaps, a hansom in a hurry, with a driver not quite so sober as he should be. The passenger cannot by any possibility get out of his way. The cabman swears at him, and drives over him, and so his "knell is knolled." This is a type of one of the commonest of street accidents. There is a favourite variation on it, in which the "crawler" plays the part of the waiting omnibus; but the principle is the same. So hundreds of people are injured every year, and scores killed. In Birmingham they have numerous small cab-stands, and allow no "crawlers." How long will it be before the London County Council take pattern by so good an example? Is this, too, one of the improvements which the Council can cheerfully put off from this year to next year, sometime or never?

VAGUE SPECIFICATIONS.

PRECISION and accuracy are unfortunately not conspicuous in the modern specification. It is hurriedly written in the spirit of getting everything good, and cheaply. A writer of some eminence has told us that the "absolute balance of give and take—the doctrine that everything has its price—and if that price is not paid, not that thing but something else is obtained," pervades all transactions, and that doctrine seems to be forgotten by the specification writer and the quantities taker. They seem to think that good material and workmanship can be had without thought, adequate description, or price. By a loose or inaccurate description, in which the terms "best," "approved," "good quality" are plentifully used, they imagine the contractor will supply the really best; but why should they anticipate so much without the trouble or thought of a really accurate description?

The vague specification is chiefly indictable in two things—namely, in describing qualities and in dealing with workmanship or modes of execution. It is in these two respects that most specifications fail. Under the head of Qualities we have everything that pertains to building stones, bricks, cements, &c., their nature and properties; the substances and qualities of various materials, like timber, iron, lead, glass, decorative materials, thickness and manufacture of all fittings. Under Workmanship, we have all in which skill and labour can do, all kinds of construction of stone, brick, timber, iron; all fittings and apparatus like lifts, heating apparatus, sanitary fixtures, ventilating contrivances. We do not complain so much of the want of completeness of specifications; every trade may be noticed, every material and fitting specified. As mere lists of materials and trades, they may be perfect. It is easy to draw up a list of requirements; but quite another thing to describe their character, the qualities of the materials and the workmanship. The latter calls for technical knowledge and experience, and it is just in regard to quality and workmanship that the specification is necessary; the drawings and quantities furnish connection and position, the number and the sizes of the various materials and fittings; but it is left to the specification to define and describe. Let us take a few instances of the want of these essentials in modern specifications. In matters of foundations a good deal is left to the builder, or recourse is had to the "covering" clause which places all responsibility on the contractor. Much indefiniteness is found. We have frequently seen clauses such as this: "Dig out for basement and for all footings to a depth necessary to obtain a good foundation," but no depth is stated beyond that which the sections supply. The contractor has to guess or take the risks, which in some cases involve an expenditure of some hundreds of pounds in addition to the quantities estimated. If a builder signs a contract with such a clause, he commits himself, but in properly-prepared contracts all excess of digging and concrete work is measured and valued. Such a clause as, "Do all the necessary pumping and shoring," may mean a good deal, or nothing at all; and the experienced contractor puts down a large sum to cover all risks.

Then the ordinary specification is often vague in its description of stone. If a particular quarry is specified, care should be taken to ascertain whether it is really working. We have known instances in which the quarry specified has actually been worked out, and a very inferior quarry has been selected in its stead. Surely with the authorised lists published of stones and quarries, an architect ought not to go wrong in these matters. The valuable reports prepared by the Commissioners of Woods and Forests, when the stone for the Houses of Parliament was selected by Sir F. A. Abel and others, are within ready access. After specifying a known quarry, the architect may cover his indecision or ignorance by adding "or stone from some other equally good quarry." But even a quarry may mislead, if the essential properties are not described. Thus, in the selection of a quarry for Portland stone for external work, the specification should state that the stone must be of "uniform structure," or from the best "base-bed" varieties, and free from cavities, which generally occur in the kind known as "whit-bed" stone, which, though often appearing of greater hardness and compactness in part, is more liable to have cavities within it. But the ordinary run of specifications merely say that the stone must be from such and such a quarry—perhaps unknown, or "of the best quality free from all veins, shakes," &c., which may mean almost anything, as it is the ordinary specification formula; for every practical builder knows how impossible it is to insure freedom from all these defects if particular quarries are specified, so that one intention is frustrated by the other. Just in the same manner, it is absurd to require that the timber is to be "perfectly free from sap, shakes, large loose knots, and other defects," a condition which can be carried out only to a limited extent, for the simple reason that few architects and clerks of works would get good timber if they rejected all with knots and shakes. So with all standards that cannot be attained. It is absurd to introduce any condition which the architect has no power to enforce, as, for instance, to say all the cement must be able to bear a certain weight without breaking, when he has practically no means or apparatus for carrying out his requirements. The various specification standards on this point alone show how useless such tests are in a majority of cases. But the architect or engineer who writes a specification for works to be executed in cement, thinks it sufficient if he copies a usual clause, such as that used by the London County Council or Mr. Grant's form; it looks like business if it has no other recommendation. Well and good if these conditions and tests can be insisted upon; but to put them in as vague and unmeaning threats can only help the evasive and underbidding contractor to an unfair position. These are the men who profit by general clauses which are not intended to be complied with; while the scrupulous builder, who tenders and takes them as meaning what they say, is the real sufferer. One of the worst faults of the modern specification is to insert clauses which cannot be carried out, or to make them so vague and indefinite that the contractor evades them altogether. The jerry builder's rule is to omit all he can; to put in the softest stone or unburnt brick when good stone and brick are specified; to fill in walls with "shuffs," and to avoid bonding where it cannot be found out. He does not mean to comply with the specification for the carpenter. Why should he if he can introduce Swedish timber for Dantzic or Memel, or substitute inferior deals for best quality Petersburg? The vague specification gives him many opportunities for omission or substitution. He eagerly seizes every general expression, as "of the best quality," "free from sap," "in a proper manner," or "approval," and interprets it in a relative manner, or as being a formula of no significance. They are convenient expressions, because they save a good deal of technical knowledge, and they save accurate and definite description of materials. It would be much better and surer, however, if a stone was definitely described as of a certain quarry and bed; if the bricks were specified as those of a certain firm's manufacture, and if the accurate trade or distinguishing brands of timbers and deals were given. If the manufacturer's name or a certain brand were given, we are sure there would be less chance of evasion in contracts. Few architects are good judges of timber; but if they take care to specify the brand, the chances of their being deceived is considerably lessened. Thus Swedish goods are carefully sorted into various qualities in the English market, giving a fair idea to the purchaser. At least such definite description of materials and qualities is more reliable than loose general terms. We cannot hope to acquire them by using specification forms—useful as they are; still less by copying old specifications for new works. We do not even say that a knowledge of "brands" and ports is always a safeguard without a personal knowledge of what is good timber. We know instances where the architect's supposed knowledge, derived from specification formulæ, has misled him. How often we hear of an architect or clerk of works condemning a joist or a rafter if it has a vein of blue sap-wood in it, when in such a position it could not matter, or be injurious to the stability of the floor or roof. It would be more detrimental to allow such sap-wood to be used as bond timber, or built in a confined place. Again, the selection of "first" qualities for timber is specified when "best selected middling" quality would be better, and more easily obtained. Swedish is condemned, although, as a matter of fact, when the scantlings are not large, an approved quality of Swedish is all that can be desired in point of suitability. These and other facts can be only learned from practical workshop or building-yard experience.

We have, so far, dwelt on qualities; but a full accurate description is no less demanded. We lately heard of a large building put up to tender in which the glass was a considerable item. There were skylights and sidelights, and it was specified that "26oz. embossed coloured glass" was to be used. What was meant by the description was probably intended for plate-glass embossed to a design. Again, it was merely specified, the "sidelights to have proper sidelight glass." Is it surprising that one who tendered simply allowed for ordinary enamel-coloured glass? There was a large quantity, and it involved a considerable sum. As for the phrase "proper sidelight glass," it was impossible to say what was intended; it meant anything the tenderer liked—plain, coloured, embossed, or any other glass; the adjective "proper" may be interpreted in many ways, and according to many standards. In another case the specification described the roofs (very extensive) to be covered with good Bangor slates; but an inferior sort was used throughout, and a considerable saving in cost must have been effected by the builder. The mistake was in not specifying the particular quarry, as that of the Penrhyn or Dinorwic, or the best Portmadoc slates from a certain quarry.

"Good Bangor" slates may mean almost anything; but the architect ought to describe not only the quarry, but the colour as well. If a green slate is wanted, it is necessary to specify the "best slates only from Coniston," which are close in texture, and do not discolour. Not long ago an architect suggested that the specification might be superseded if the architect wrote all his descriptions and instructions on the plans, sections, and elevations, and confined his specification to a bare description of materials and preliminary clauses, without a thought of what a small scale set of drawings would be like if so burdened with descriptive matter. On the face of it the idea is feasible, as the elevation would have notes of all facing materials and details, the sections of all construction and internal joinery and fittings, plastering, &c.; the plans of everything relating to the drains, laying of floors, pavings, hearths, &c. These are matters which, however, are more conveniently introduced in the specification of all the trades, and which is accessible to all those concerned on the building. The separate document form can be divided if necessary, whereas it would be undesirable that the mason or carpenter or plasterer should have the exclusive use of the drawings. For these and other obvious reasons the specification is the right instrument for all explanatory information, if we take the trouble to make it clear and definitive, and supplementary to the drawings.

MODEL DAIRY COMPETITION.

THE British Dairy Farmers' Association have on view at the Agricultural Hall, Islington, a collection of plans and models of dairies which is of some interest. Prizes for these were offered some time ago by Sir James Blyth, Bart. In one class for small dairies, prizes of £25, £15, and £10 were offered for the three best plans for a dairy "adapted for the manufacture of both butter and cheese, and capable of dealing with the milk of not more than 25 cows." In class 82, the same prizes were offered for plans for a similar dairy capable of dealing with 50 cows, and there were also prizes of £60, £30, and £10 for models of a permanent and portable dairies. We may first refer to the awarded plans of both these classes. The judges who have awarded the prizes are T. Penrose Fitzgerald, Midleton, co. Cork; the Hon. Cecil T. Parker, Eccleston, Chester; and W. D. Caröe, architect, M.A., P.A.A. In the class of the larger dairies, the first prize has been given to No. 1627, by Mr. Charles A. Callon, of Victoria-street, S.W., for a design which shows a compact arrangement of dairy, and a pleasing exterior of red brickwork with tile roofs. The central portion has a butter-making room in front, gabled, 15ft. by 12ft., with side entrance under a verandah, which surrounds the building. Behind, in communication, is the cheese-making room, 15ft. by 12ft., with double steel cheese-tub, cooling vat, cheese-presses, and curd-mill. A side stairs leads to cheese-room over, in gabled portion of roof. This is fitted with revolving racks for 147 cheeses, and is ventilated by a shaft which forms an ornamental cupola externally. Connected with the butter and cheese-making rooms on ground floor is the milk-room, 14ft. square, surrounded by shelves or settling pans. Coolness is secured by the surrounding verandah, and there are three windows, which insure light, cleanliness, and ventilation. The right-hand wing has a boiler-house, with separate entrance, and a scullery. The author has a practical knowledge of the requirements of a dairy, which can be worked either by hand or steam power. The plans and details show a due regard for the drainage and sanitary conditions. There is shown a cistern in roof to hold 500 gallons. The drains are clearly drawn, with proper manhole-chambers and traps. The walls are of brick, with cavity. Windows with casements hinged are shown; the upper ones hinged at bottom, to fall inward, and the lower casements hinged at sides. Gauze wire-blinds are provided—a very useful precaution in summer time, and glazed sashes in the winter on the outer face of walls to open outwards. The roofs have air-shafts, and ventilators with louvre openings. Channel gullies are shown with grids. A detail drawing illustrates revolving cheese-racks, which rest on castors, and revolve on centres in the cheese-room. The elevations are simply and artistically conceived, the centre gabled portion projects, and is finished with timber framing rough-stuccoed below. The milk-room on one side, and the scullery and boiler-house on the other, are single-storied, with steep roofs of tile, which project over the verandahs. The same author receives the second prize in the next class for 25 cows. The plan is similar, and has a central butter and cheese-making room, with milk-room on the left, and boiler and scullery on the right, and there is a verandah. A similar external treatment is also shown. In both sets the author exhibits a grasp of the requirements; the plans and details are clearly drawn, and the elevations appropriate in style and economical.

The second and third prizes have not been awarded in class 82. The plan by Messrs. A. R. G. and H. S. Fenning, of Lincoln's Inn-fields, has been commended. It is is a simple rectangle, with a large dairy, 23ft. by 16ft., on the east side, and a washhouse and entrance at the west side. The cheese-room is over the dairy, with turning shelf. This arrangement has the merit of simplicity; it can be roofed in one span, and the dairy and cheese-room are well lighted and ventilated. The upper story is tile-hung, and the treatment in brick and tile is suitable and inexpensive. Hollow walls are shown, and the ventilating and draining arrangements appear to be good. The judges have also commended two other plans. The first is by Mr. C. A. Battie, of Hornsey-road, and the second by Mr. W. Rowland Howell, of Reading. The first is a rectangle, nearly a square, having a high-pitched tiled roof hipped all round, with a centre extraction turret at the summit. The cheese-making room is in the centre, with butter-making room on one side and store-room. The author has studied economy of service and expeditious working in the plan of the departments. The washing, boiler-house, and fuel store are conveniently arranged along one side, and curing room is in the roof. The design is cleverly treated and simple. The latter is also an ingenious plan, but rather broken up by the tower, which is intended for a cistern. The pressed cheese drying-room is in the upper story. There is an artistic feeling in the drawing, but economy is not the strongest point of the design. In the same class we may note No. 1613, a plan showing some knowledge of details in the arrangement of a dairy; the external design is simple, the author shows a high thatched roof, and puts peat moss litter round walls of butter larder. The cheese store is in the roof. No. 1614, by Mr. Leonard J. Hughes, has a plan with corridor connection to house and an entrance from farm, with scullery and engine-rooms on each side with press-room, cheese and butter dairies in rear, and curing-room over. The details are less satisfactory, and elevation not characteristic. The author of 1616 has a compact plan with entrance shed, but the drawings are spoilt by the pink tint of roof. The authors of 1630 (Archer and Hooper) have a more original plan, and treatment artistically conceived and tinted in sepia. The cheese-making room is in the centre between the milk and cheese rooms, with an open verandah in front of entrance, and the external elevation, with its high roof and dormer lights over verandah, is cleverly treated.

The plans for the smaller dairy (Class 81) show two or three able and practical designs. We have already noticed the design placed second, by Mr. Callon, as one of the best. The first prize is withheld. A plan with a ticket printed "Reserve No." (1612; John H. Phillips and J. Gunter, Cardiff) is compact and economical. The dairy, 28ft. by 21ft., is well lighted and ventilated by windows on three sides, with a projecting heating chamber on left for heating below level of ground. A scullery and cheese-room occupy a position also on this side. An alternative plan shows two cheese rooms for young and old cheese. The elevations are suitable, with a single-span tile roof, and hollow brick walls are shown. No. 1596 has been awarded the third prize, and is by Messrs. Fenning, of Lincoln's Inn-fields. The plan of dairy occupies the main area of building, and is 16ft. 4in. by 15ft., fitted with churn, cream separator, butter dryer, vat, &c. There is an entrance from a corner porch, with washhouse and a stair to cheese-room over. The section shows concrete and rolled-iron joist floor. The arrangement is compact and inexpensive, and the external design appropriate. The elevations are artistically treated. Brick and red tile hanging to the walls, which are hollow, and a high tiled roof are shown and effectively coloured. Next to it (1597) is a well-detailed plan in one floor, indicating practical knowledge; but there is a want of concentration. The milk-room is connected with the cheese and butter-making rooms, each on a separate block, which would not admit of simple roofing. On the ground floor also are a separator room between milk and butter room, a butter and cheese store, a cheese-curing room, and washing-room. The walls are hollow, with an outer casing of 2½in. slabs of concrete, and an inner casing of rough plate glass in large squares, or concrete slabs supported by a framework of rolled mild-steel joists, channels, T's and L's. The details are well considered.

No. 1607 has the butter dairy separated by a porch from the cheese dairy and cheese-room. The plan is simple and has a yard in front of entrance, and the elevation with the gable ends is plainly treated. No. 1611 is wasteful in the entrance passage between milk and churn room; it is one story surrounded by a verandah. No. 1609 is also wanting in compactness. In many of the plans the milk-room is not in convenient relation to the butter and cheese-making rooms, and the two latter are not placed together as they should be for economical working. The vat should be near the milk-room, and the other fittings placed in those positions which offer the greatest convenience and save labour. Again, the sizes of the cheese and butter-making rooms should have reference to the quantity of milk obtained or the number of gallons per day.

Six models are exhibited, and these show a large expenditure of cost and labour. Messrs. Boulton and Paul, of Norwich, have a well-constructed model, to a scale of 2in. to the foot, of a portable dairy, adapted for the making of butter, to deal with the milk of 20 cows. The plan consists of a simple parallelogram, divided into a dairy and scullery, with ingress and exit in the centre, and the construction is shown in the Norwegian style, having framework and external 3in. deals, continued past and halved at angles, fitted to a long bolt at intervals; it is lined internally with matchboarding or vertical battens in sections, and has a roof also in sections covered with felt. This receives a second prize, the only one given. The plans and models are worth a visit.

◆

THE BUILDING OPERATIONS OF THE LONDON SCHOOL BOARD.

THE fourth annual Report of the Works Committee of the London School Board states that during the year ended March last the Board were engaged in purchasing interests in 55 sites. The cost of these interests was £82,265, the surveyors' fees, &c., agreed to at the time of purchase being £980. The value of all the sites purchased, or agreed to be purchased, previous to March, 1894, was £2,903,207, and costs £406,601. The total cost, therefore, of the sites purchased up to the end of the year under review was £2,985,472, and costs £407,581. The cost of the sites for 294 schools was £6 15s. 3d. per child. The total number of permanent schools which had been erected and opened to Lady Day, 1894, was 397. During the year under review nine additional schools and 28 enlargements were opened. The total amount of the loans which the Education Department authorised the Board to incur on account of these nine schools and sites was £170,417, and on account of the 28 enlargements and sites, £301,555. The average cost per head of the 294 school buildings, and of the furniture the accounts of which had been completed at September, 1894, was:—School buildings (exclusive of sites), £12 2s. 3d. per head, and furniture and fittings, 10s. 6d. Tenders had been accepted during the year for erecting eight new schools, providing accommodation for 7,447 children. Each of the eight schools, when completed, would be provided with halls, which are not counted in the accommodation, and the tenders for the new schools included the provision of cookery, laundry, and manual training centres, and in many cases a drawing-class. Tenders had also been accepted for erecting 22 enlargements of schools, including two junior mixed schools and one senior mixed school, providing accommodation for 7,102 children. All the schools which were now being erected by the Board were provided with apparatus other than open fireplaces for warming the buildings. In December, 1892, the Committee decided that each clerk of the works for repairs should be instructed to inspect and report on the drains of the schools in his district and to submit an annual report on the state of the drains and the sanitary arrangements of the schools. Reports had been received for 1894, which showed that 179 schools tenders for providing new drainage were to be obtained as soon as possible. Of these the drainage work in 79 cases had been completed, tenders had been obtained for carrying out the work in 16 cases, in 20 other cases the work would be carried out in connection with enlargements for which tenders had been accepted, and plans and specifications were being or will be prepared in the 64 remaining cases. There were 160 schools painted or cleaned during the year. The system of carrying out repairs to school buildings by workmen employed direct by the Board was being continued in 9 of the 18 districts of the Clerk of the Works for Repairs. The staff employed consisted of 20 carpenters, 12 plumbers, 2 bricklayers, 10 painters, 23 general labourers, and 12 plumbers' labourers. A stock of the materials necesssary for carrying out the repairs was stored at the Clerk of the Works' office in each of these districts, and the schoolkeeper was encouraged by the supply of tools and materials to carry out simple repairs which could be done without special assistance. The whole of the repairs to furniture were now being carried out by workmen employed direct by the Board. At the date of this report there were 29 carpenters, 7 painters, and 9 labourers employed on this work. In May, 1894, the Board decided that in all future building contracts there be inserted a clause binding the contractors to pay the rates of wages mutually agreed upon by the Central Association of Master Builders of London and the London Building Trades Federation. Since then the Board had

agreed to consent to the following amended clause in all building contracts :—"Where the London scale of wages shall apply the contractor shall pay to the workmen employed by him the rates of wages mutually agreed upon by the Central Association of Master Builders of London and the representatives of the Unions of the various branches of the building trade, and which agreed rates of wages are set out in the schedule. In all other districts where the London scale of wages shall not apply, the contractor shall pay the workmen and all other persons employed by him in connection with his contract not less than the minimum standard rate of wages, which may for the time being be usual and generally paid where such workmen are employed." On March 25 last the following was the amount of school accommodation in course of provision :—Ten schools were in course of erection, providing accommodation for 9,622 children; 24 enlargements were in course of erection, providing accommodation for 7,562 children; 26 additional sites for new schools had been or were being purchased, the schools to be erected on which would provide accommodation for 22,202 children; 25 sites for new schools had been scheduled in the session 1894-95, the schools upon which would provide accommodation for 21,800 children; and 34 enlargements of schools had been sanctioned by the Board, for which tenders had not been accepted, providing accommodation for 11,919 children. The Education Department had also sanctioned the provision of sites in six districts (which would be scheduled next session), the schools upon which would provide accommodation for 4,000 children.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XIV.—ITALIAN RENAISSANCE : ENRICHMENTS.

NOWHERE did the exuberant fancy of the early Renaissance architects find such free play as in the enrichments of their buildings. Founding their designs mainly upon the scroll-work of ancient Rome, in low relief, they developed a treatment which, while of infinite variety, is always recognisable as that of their age and country. Sometimes formal, sometimes free, always conventional, always subdued sufficiently not to interfere with the general design which it decorates, it is uniformly pleasing. Panels and pilasters are freely ornamented with scrolls in which the acanthus is largely, but by no means exclusively, used, other leaves and flowers being introduced, conventionally treated in a highly decorative way, to fill, but not to crowd, the space available; and even what appears to be crowded in an outline drawing is not invariably so when executed in low, but varying, relief.

As examples, a few illustrations are given; but the variety is so infinite that they can only be accepted as notes of the sort of thing which is to be expected. So we have the formal treatment by Benedetto da Maiana in the panels of his wall-fountain (now at South Kensington Museum) of the poppy-head, pansy, and other flowers; while

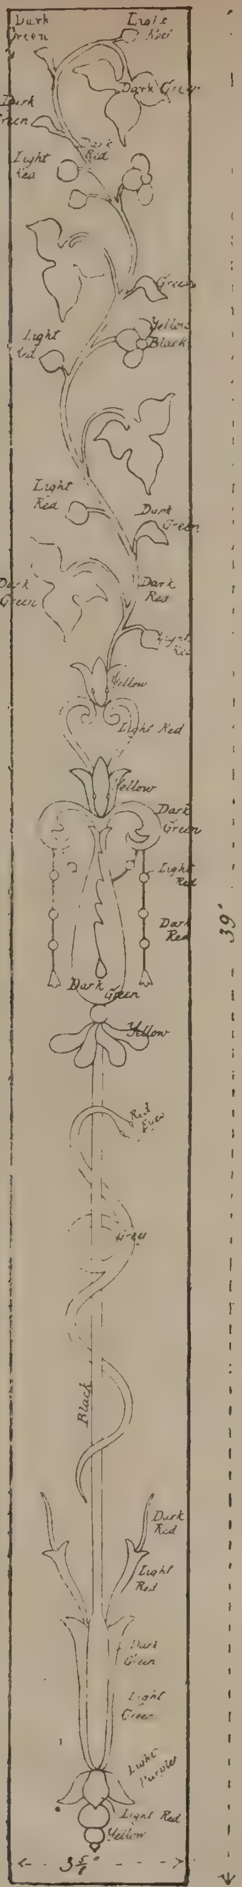
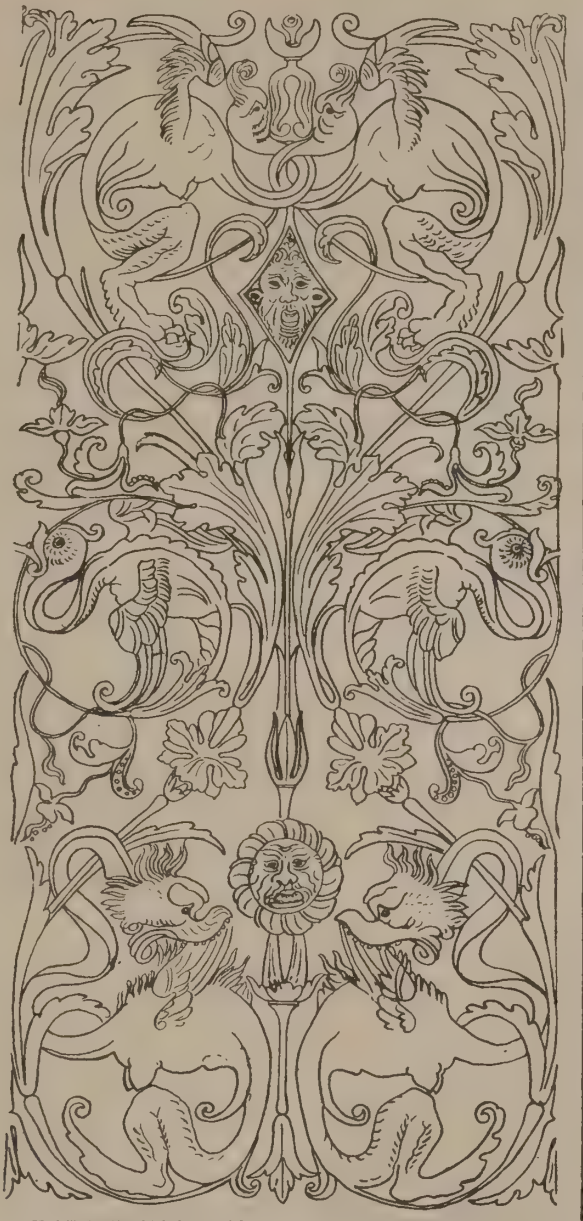
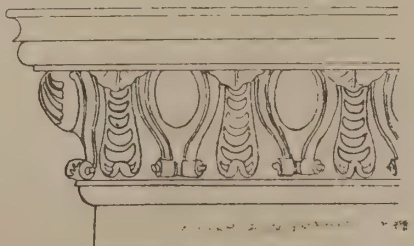
ANTHEMION FROM THE TOMB IN THE CAMPO SANTO AT PISA.—By Stagio Stagi.



INLAID PANEL FROM A MILANESE CHIMNEY-PIECE. (About A.D. 1600.)



ONE-THIRD OF DRUM OF COLUMN FROM PALACE AT CESENA. (About A.D. 1500.)



RENAISSANCE VARIATION OF EGG-AND-TONGUE (ROME).

in Matteo Civitale's panel from Lucca there is a much more light treatment of grasses and the acanthus leaf, with a capital which, if elegant, is also a curious variation of the Corinthian. Again, the Florentine wall-fountain shows the acanthus leaf upon the stem of the vase, almost as it would have appeared in Roman work; but upon the vase itself are wreaths and scrolls, birds and fish, and even a cupid's head, in rich variety; and this full decoration of the surface and the introduction of life is carried further still in the enriched column from the Palace at Cesena, where masks and grotesque figures with parrots' heads are freely used. In all these, despite their differences, there is the same spirit of elegance and freedom of design; and they are all of much the same date—the close of the 15th century.

Though a hundred years later in date, much the same spirit is also evident in the panel from a Milanese chimney-piece; but in that example the decoration was not in relief, but inlaid in coloured marbles within a white marble ground, having a light yellow flush upon it here and there. The design is a trifle more straggly, however, and it was in this direction, towards poverty, that deterioration took place eventually in the North of Italy.

In Rome, however, at that date, the copyism of the ancient Roman character, already noticed, was in full force, and variations and developments of enrichments took a more formal course, as they did in the general designs. Borromini's capital is sufficient to illustrate what is meant, especially if similar features already illustrated be referred to—a principal characteristic being massiveness, in place of the delicacy of the early work in Florence and the North. In fact, the details are rather magnificent than beautiful, beauty being often sadly lacking, especially in later work, as evidenced by the garish variation of the egg-and-tongue, of which a sketch is given, and which may well be compared with the anthemion from the Tomb, by Stagio Stagi, in the Campo Santo of Pisa, of about 1530 A.D., which, worked on a curved frieze, is light and graceful in its low relief, even though it does not possess the full beauty of curve of the examples of scroll-work already mentioned of thirty years before.

Enough has been said now, however, to show how true in all respects was the architecture of the Italian Renaissance, instinct with life, with the spirit of development, with the sense of beauty, and with applicability to the needs of the time and people. Its early work was the most refined, its later most full, and its last, with signs of debasement in eccentricity and vulgarity, was but in the usual course. It was a true architecture—a genuine development of Classic work with Classic details adapted to new purposes and used in a new way.

CONCERT HALLS AND ASSEMBLY ROOMS.—I.

By Ernest A. E. Woodrow, A.R.I.B.A.

There is constantly a fresh demand for additional buildings for public entertainment and instruction. Every town and every village, whether at home or in the colonies, requires, and obtains its concert-room or its assembly-room; and if the local community cannot afford to erect a special building, it adapts and converts the largest room in the town or village into its place of public resort.

The variety of the buildings containing within them rooms or halls for public entertainment are so numerous, and the conditions under which they are used vary so widely, that it is difficult to classify them to any extent. Before entering into matters of detail as to their internal arrangements, it is, however, necessary to mention the various kinds of places of public resort.

Among those which are erected for the special purposes of the concert-hall and assembly-room, are, first and foremost, the concert-hall proper, such as the Royal Albert Hall, and the Queen's Hall, in Langham-place. Then follow the concert-halls in connection with other premises, such as St. James's Hall, in the St. James's Restaurant; the King's Hall, at the Holborn Restaurant; and the Whitehall Rooms, in the Hotel Metropole; which give us the latest development of the assembly and public dancing-room combined. These may be accepted as premises which have been essentially erected for a specific purpose, either for music or dancing, or other entertainments of the like kind.

There are also buildings with two or more halls within them, such as a concert-hall, with a minor hall under the same roof; in many cases, whole suites of rooms are arranged for public reception.

Next in order come those buildings which are erected primarily for a wholly different usage, but have within them a hall or room devoted to entertainments; this class includes such buildings as hotels, with large assembly-rooms or dancing-rooms attached.

Lastly may be mentioned buildings used for public entertainment, but not originally designed for that purpose—that is, buildings which are at some time or another converted into dancing-rooms or concert-halls, such as swimming-baths, skating-rinks, &c.

To trace the development of these classes one is almost forced to consider their origin. The public concert-room, and with it no doubt the music-hall, found its birth in the club-room of the public-house, and commenced with the free-and-easy concert among the frequenters of the house; then followed the engagement at these entertainments of one or more paid professionals, after which the amateur entirely dropped out, and some licensed houses gave more attention to the "variety" entertainment and became music-halls; while others cultivated the glees and part songs, thus adding to the number of concert-halls.

The club-room of which many still exist, and which must be considered hereafter in detail in these papers, must therefore not be dismissed as unimportant; not only has it been the origin of the buildings devoted to music, but also the commencement of the dancing-room, public ball-room, casino, and all the varied developments of the assembly-room. This can be more easily understood when it is remembered that in many provincial towns the hotel still contains the only place for public assemblies, auctions, balls, bazaars, political meetings, &c.

The public dancing-room which is used by the dancing-master for tuition becomes at night a place for assemblies and balls, and the arrangement of this is as important as that of the large halls which are used only for balls.

Where the assembly-rooms consist of a group of halls or rooms there are to be found the large, or ball-room, the supper-room, the smaller dancing-room, and the retiring-rooms. Buildings exist where one or more entertainments take place at the same time. Take, for example, St. James's Hall or the Moore and Burgess Minstrels' Hall, the large and small concert-halls at the Queen's Hall. Of larger buildings used for many and various purposes, there are such places as the Royal Agricultural Hall and the Royal Aquarium. Again, there is a still further development, as seen in the Crystal Palace, while the grouping and arrangement of buildings at international and minor exhibitions are, indeed, of the most grave and greatest importance.

Parochial rooms, rooms attached to places of worship of all denominations, the "iron" room, Sunday-school rooms, are all at one time or another used for public assembly-rooms. In institutions, polytechnics, asylums, and hospitals are to be found other variations of the public-hall, while vestry buildings would now be considered incomplete without the large concert-hall and assembly-room, which, indeed, is never used for vestry purposes, and which some may doubt whether the local authorities are within their rights in erecting out of the public funds to compete with private enterprise in providing entertainments for the people. However, that is not a point which need concern us in these papers.

At most of our seaside watering-places are to be found concert-halls constructed upon the piers. Some of them are of such a size as to hold many hundreds of people. Many are fitted with a stage and all the accessories of scenic display for theatrical performances, while others are arranged for orchestral music only, as at Southsea. Another variety of the seaside place of amusement is the "Spa" buildings, as at Scarboro', the casino, or kursaal, notably found in townships abroad which are summer resorts and bathing-places. In the hydropathic establishments, and even in the large boarding houses of later days, are to be found the large "common" room for dancing, concerts, and theatricals.

We must, however, look abroad to see what can be done in the way of making the public assembly-room veritable palaces; while even whole townships are proposed to be erected on the Continent solely for pleasure resorts, the casino, the assembly-room, the concert-hall, the theatre, and the racecourse being the centre round which the hotel and boarding-houses are to be erected. There are already two such projects on foot, Mayville, on the French coast, and Farnoe, in Denmark. Other Continental watering-places are noted for their buildings devoted to public "play" and gambling, as at Monte Carlo, and the Spa at Ostend, closed last year by the police. In Switzerland and Germany we find the Ton Halle, notably a Swiss institution, a kind of people's palace, containing a large number of assembly-rooms, and examples of this class are the building erected in Zurich by Messrs. Fellner and Helmer, as well as the Albert Palace at Leipsic, which also contains a circus. The People's Theatre at Worms is closely connected with this class, for it contains an assembly-hall as well as a theatre.

Of the group of buildings erected for other purposes than public assembly-rooms, but adapted at some time during the year for music and dancing, the swimming-bath may be considered most important. These, during the winter, have the bath or tank floored over, a platform erected at one end, and, instead of having the revenue stopped when the bathing season is over, the exchequer is enlarged by "lettings" for concerts, lectures, *soirées*, dances, &c.

The Baths and Washhouses Act will not permit premises to be licensed which have been erected under the commissioners; that is to say, it forbids a bath having a license for music or dancing, but says nothing about it being deprived of a stage-play license. It is legal to turn such a bath into a theatre, but not into a concert-room or ball-room, for which it is far more suitable. This is one of the strange anomalies of our out-of-date licensing laws which everybody would gladly see amended.

My long list of classes of building to be considered in these articles from an architect's point of view would be incomplete without a brief mention of the conservatoires, schools of music, public schools, and even private schoolrooms which are used for public performances. The skating-rink, with its latest development, the natural-ice rink, must also be mentioned.

The purpose of these papers is to consider what are the best methods of arranging the many buildings enumerated so as to adapt them to the many purposes they have to be put to, and to plan and construct them with a view to the safety of the public frequenting them. There is often very great danger to many of these buildings because of the bad arrangements of the plan, great danger from panic, inadequate exits, and fire. The risk from fire arises from many sources, not seen in the room or hall itself, but which, upon careful examination of the premises from an architect's and fireman's point of view, can be seen to exist in other portions of the building, in the surrounding building, or from the temporary arrangements made in the hall itself for private or other theatricals, bazaars, and varied entertainments.

At one time or another nearly every architect is called upon to build one or other of the kind of buildings I have mentioned; not like theatres, which are built by the few, the concert-hall or assembly-room is incorporated in one form or another in such a very large number of buildings, that its arrangement and planning must be the work of every architect.

After dealing in these columns at some length with the planning and construction of the most important of all public buildings—i.e., the theatre—it is but natural that I should now turn my attention to the subject before us. It has fallen to my lot, during some years past, to examine plans and visit buildings intended for one or other of the above-mentioned usages of the concert-hall and assembly-room. Some of the points which have been forced thereby under my notice may, I hope, be of service to my readers. To design a building suitable to be used for so many purposes is no easy matter; to make a hall fit and safe alike for theatricals, bazaars, concerts, lectures, flower shows, political meetings, industrial exhibitions, and balls is indeed a task. Many of the defects which become evident in these buildings are due to the fact that, when they are first built they are not intended for the complex usage to which they are subsequently subjected; the architect may, therefore, not be so far to blame for the defects, not seeing the inventive mind of his client, or conceiving the use to which he will put his hall or room. But, after all, it must be remembered that these premises are built for money-making, and when there is a chance to let the hall for a few guineas—never mind for what entertainment—the owner will not hesitate or concern himself as to the suitability of the building for the purposes to which it is to be put. It is for this reason that the architect must be ever far-seeing and imaginative, and must provide for every contingency. Difficult as a successful theatre is to design, the assembly-room, as now employed, is far more difficult.

Many men intrusted with the designing of public buildings show a surprising ignorance of the primary and essential requirements of public safety; they totally ignore the rudimentary rules as to entrances and exits; they overlook the necessity of separating fire risks, and totally ignore the fact that they are building an assembly-room in the widest sense.

NATIONAL ASSOCIATION OF SLATE MERCHANTS AND SLATERS.

THE third annual meeting of this Association was held on Wednesday at noon at the Cannon-street Hotel, E.C. Mr. Charles Nicholson, of Newcastle-on-Tyne, the President for 1894-5, occupied the chair, and there were also present all the vice-presidents—viz., Messrs. C. Braby, London; T. Flewitt, Nottingham; W. Follitt, London; H. Shenton, Derby; W. R. Thompson, Dewsbury; and G. W. Wylie, South Shields; also Mr. J. Hunter, J.P., Hull, treasurer; Mr. James Townsley, of Hull, hon. general secretary; Mr. Tom Turner, J.P., Hull and Beverley, solicitor, and between fifty and sixty other members, for the greater part belonging to the North of England and North Wales.

After the transaction of formal business, the President read his valedictory address. He remarked that they were gathered together as business men having one common interest at stake. They had now completed the third year's work as an association, and their achievements thus far could not be considered otherwise than highly satisfactory. The work had been going on apace in a silent and unostentatious manner, and while the executive pursued their present policy, he saw nothing but success before them. There were, he regretted to observe, still a few engaged in the slate business who did not fall in with the movement. In the interests of all that was good in the trade, he hoped that their indifference towards the Association would develop into a desire to know the actual facts about its work, for with such knowledge he could not understand that any right-minded man would separate himself from them. He would candidly confess that three-and-a-half years ago, when the National Association was first mooted, he received a circular and list of questions; he replied most emphatically that he did not believe such a scheme as the present one was possible, and he would not aid the movement until he knew more about its objects, its management, and its promoters. Out of curiosity he attended a meeting, when he was so favourably impressed that he joined the Association, and had since done his best to assist in the consolidation of the North of England branch, which is now about the largest and most complete branch in connection with the Association. What was possible in one district was equally practicable elsewhere, and he therefore urged all members of weak districts to work energetically to increase the membership. If a member called on his neighbours, asked their co-operation, and showed them that he did not want to monopolise all the trade of the neighbourhood, but was prepared to deal faithfully by all, depend upon it such a man would meet with success. The president spoke in high terms of the work being done by their honorary secretary, and urged members to support Mr. Townsley's efforts by extending the scope of the Association. There were one or two local associations which had not yet affiliated them-

24 Albion St Leeds.
Chas B Howdill del.

selves with the Association, though there was perfect harmony between them, and he appealed to such to throw in their lot with the general body. In conclusion, he heartily welcomed the non-members who were present.

On the motion of Mr. Starkey, of Leicester, seconded by Mr. A. B. Partridge, also of Leicester, the President was thanked for his address, which it was decided to print and circulate among the members.

The hon. secretary then read his annual report, which stated that the Association had made rapid strides, not only in membership, but in influence for good during the year. The organisation was becoming more consolidated, and there was a growing desire manifested by the branches to be more closely allied to each other, and for the federation of smaller bodies. Their register had been largely augmented during the past year, and 24 new members had been elected, 10 fresh towns previously without members being represented. The number of firms or individual members at the end of last year was 144; three had been struck off, owing to withdrawal from business, but 24 had been added, making the present total of *bonâ-fide* paid-up members 165. This was pretty satisfactory seeing there were only about 400 firms in the trade all told; but it was evident that there were still several firms whom they would all welcome to the register. He had to announce the deaths of three members—Messrs. Haigh, of Rochdale; Capes, of Grimsby; and James Season, of Leeds. Branch meetings had been held in various parts of the country, and he appealed to them to use their influence to induce all in the trade to co-operate by joining the association.

The report was adopted on the motion of Mr. John Wharton, of Darlington, past president, seconded by Mr. T. Mandle, of Maryport.

Mr. Hunter read his report as treasurer, which was of a satisfactory character, there being a balance in hand. The report was adopted on the motion of Mr. Davies, of Portmadoc, seconded by Mr. S. Addison, of North Shields.

The election of officers then took place, the following being unanimously elected, seriatim:—President: Mr. A. B. Partridge, Leicester. Vice-presidents: Messrs. C. Braby, London; T. Flewitt, Nottingham; W. Follitt, London; R. Mascall, Middlesbrough; D. Nelson, Sunderland; and H. Shenton, Derby. Past presidents: Messrs. Jn. Wharton, Darlington; S. Worsnop, Leeds; C. Nicholson, Newcastle. Central Board: S. Addison and Son, Shields; J. Atkinson and Son, Leeds; E. Beck and Sons, Newcastle; Davies Bros., Portmadoc; Evans and Co., Accrington; Fergusson and Starkey, Leicester; W. Frost and Son, Derby; J. Hardgrave, York; J. Harrison, Middlesbrough; Benj. Hewitson, King's Lynn; Hollis Bros. and Co., Leicester; W. E. Jowitt, Huddersfield; J. B. Johnson and Son, Liverpool; T. Mandle, Maryport; J. E. Nelson, Sunderland; J. Rushton and Son, Bacup; J. Shepherd, Harrogate; Jas. Smithies, Bradford; W. R. Thompson, Dewsbury; J. G. Tuxford, Deganwy; and Woodward, Clark and Co., Nottingham.

The only alterations from the original "house list" of nominations were the substitution of Mr. Jowitt's name for that of Mr. James Season, of Leeds, deceased, and the withdrawal of Mr. Wylie, of Shields, who declined re-election.

Mr. Nicholson then vacated the chair in favour of Mr. Partridge, who expressed his thanks for the honour done him, concluding by moving a vote of thanks to the late president for his loyal services during his year of office. This was seconded by Mr. J. G. Tuxford, carried by acclamation, and suitably acknowledged by Mr. Nicholson. A similar vote of thanks was accorded Mr. Townsley, the hon. secretary, on the motion of the President, seconded by Mr. T. Flewitt, of Nottingham, and closed the proceedings.

PRIMITIVE METHODIST CHAPEL AND SCHOOLS, CARDIGAN-STREET, LEEDS.

THE schools were built in 1883, and have a central hall for 460, with infants' school, band-room, and eleven classrooms, with conveniences. The cost was £2,200. The chapel is built in 13th-century English Gothic style, of Yorkshire pitch-faced stone with Bramley Fall stone dressings; covered with best Bangor slates; windows glazed with cathedral glass in leaded lights; pews are circular, and of pitch-pine. The nave is divided from the aisles by stone arcading, and the roofs covering both are open-timbered and boarded. The minister's vestry, lavatory, and heating-chamber are under the choir in the apse at the south end. The heating is by low-pressure steam. The chapel is ventilated by numerous inlets, the foul air being extracted by a large slated wood ventilator on the ridge of nave-roof. The whole of the site is surrounded by boundary walls and wrought-iron railing. Sitting accommodation is provided for over 600 persons, at a total cost of £2,500. The buildings have been erected from the designs and under the supervision of the architects, Messrs. Thos. Howdill and Charles B. Howdill, A.R.I.B.A., 24, Albion-street, Leeds. The chapel was opened three weeks ago by the Rev. J. Watson, principal of the Theological College, and President of the Conference.

THE INCORPORATED ASSOCIATION OF MUNICIPAL AND COUNTY ENGINEERS.

THE twentieth Voluntary Pass Examination of candidates for the offices of municipal engineers and surveyors to district councils, carried out by this association, was held at the Town Hall, Manchester, on Friday and Saturday, the 4th and 5th inst. Thirteen candidates entered themselves for the examination, the written portion of which was taken on the first day; the greater part of the second day was occupied with the *viva voce* portion of the examination. The examiners were: (1) For engineering as applied to municipal work, T. De Courcy Meade, M.Inst.C.E., past-president; (2) for building construction, E. Pritchard, M.Inst.C.E., past-president; (3) for sanitary science, J. Lemon, M.Inst.C.E., past-president; (4) for public health law, J. T. Eayrs, M.Inst.C.E., past-president.

CLUNY.—IV.

By May Morris.

CHESTS AND FURNITURE.

I HAVE several times alluded to the mixture of simplicity and luxury that characterised the house-fittings and furniture of the Middle Ages. Yet the widespread conception of the life of these our forefathers—that it was gross and lavish in exterior pomp and ceremony, but rough and miserable and wanting in refinement in all domestic details—is a mistaken one: mistaken twofold—mistaken in *fact*, and also because the standard or ideal of comfort and refinement, as it is almost forced upon us now from the sheer superabundance of modern resources, is apt to be superficial, if not often wrong or vulgar. The hard life our Mediæval forefathers lived was not necessarily a gross or an unintellectual one—indeed, it is one of my objects in these papers to insist upon the pre-eminence of the thoughtful and intellectual qualities as expressed in the domestic art of the 13th, 14th, and 15th centuries. To distinguish between true and false luxury would be to go into the matter too deeply here. There was certainly very little in those times of the superfluities and caprices of fashion, which are often confounded with luxury; the great feasts we read of were occasional, and were affairs of pomp and politics. Even in the richest households the fare was habitually simple and often rough. But a rich merchant of the City of London might have been rather scornful of the dull and mean aspect of the suburban residence of his modern prototype. The forced strawberries and roses glowing on the table, while the snow lay on the road outside, would possibly strike him less than the poor and ugly dishes and bowls in which they were placed; he would comment less on the comfort of soft chairs and luxurious window-curtains, than on the lack of rich detail in the furniture and of colour in the hangings themselves. Let us call up before us the 14th-century merchant's living-room, with its cupboard or dresser fitted with flagons and cups of silver, of parcel-gilt and of laton, all of elegant shape and finely worked. The dresser itself was a noble piece of furniture, though simple in its construction. The few seats besides the dining benches were freely carved, and the long settle before the fire covered with gay cloths and abundant cushions. The stone above the hearth was carved and painted with devices and pious or hospitable legends, while across the room the sun strayed in broken lines through an arched and traceried window, with its slender columns and lightly-moulded capitals. I do not pretend that the Mediæval man of business had sensitive artistic perceptions far beyond any such possible to a man in the same position to-day; within certain limits, his household goods, interesting and beautiful as we think them, may not have afforded him more pleasure than their solid, costly substitutes do to his modern prototype. But the fact that such goods, common every-day things then, are now museum specimens (valued more, I am sure, for their beauty than for their rarity), shows that the standard of life was in many ways universally higher than people are inclined to allow. Does it not say something for the refinement and luxury of a people when they cannot make their common kitchen utensils, their workmen's tools, arms, &c., and all the little odds and ends for personal use, except in comely shapes, and with something fanciful added to their utility? Not to know how to make an ugly or an awkward shape; just think of it! No wonder we find it difficult to put ourselves inside the skins of these forefathers of ours, their habit of thought, their habit of life, their surroundings being so different from our own.

The carved chest illustrated this week is one of the rarest and most interesting possessions of the Cluny Museum. It dates from the earliest years of the 14th century or the end of the 13th century, and every inch of it is covered with elaborate ornament. It is singularly elegant in form and proportion; the lid and top lines of the chest are very slightly curved, and the base is cut away in the centre in two bold curves forming a wide, flat arch; all this arrangement of the lines gives grace and lightness to what is in reality a very solid piece of furniture. The locks, chains, and fittings are contemporary, and it is interesting to note that there are traces of painting about the ironwork of the fastenings. On the front are carved the twelve peers of Charlemagne, each in his little niche, his arms displayed on his shield. This part of the carving is interesting for the armour, which is executed with precision. Three of the knights wear their crossed helmets, another is in the act of extinguishing himself in his, while some wear merely a round steel cap over their hauberk of chain-mail. They are all clad from head to foot in flexible chain-mail, with a loose, flowing coat over it—a really graceful costume. This is the only period, to my thinking, when armour can be said to have constituted a beautiful attire. The lid on this side is carved into a rich border of rosettes and long, crawling, dragon-things, while the supporters on each side at the base of the chest are griffons with curly tails. The corresponding back side is simpler, but no less decorative. Note the beautiful arrangement of double arches, resolving themselves above into quite a woodland grove, with birds and griffons flying about and preening themselves in the niches and among the crockets grown into waving branches. The four little groups (see illustration) represent games and sports. The little man on the left plays on the bagpipes, while the lady dances; the next, I think, is stone-throwing; next wrestling, pick-a-back, and, lastly, a hawking scene (the man has just unhooded his falcon). One of the end panels represents, according to M. Viollet-le-Duc, a scene from the "Quatre Fils Aymon," though I cannot myself locate it in the story; while the other end has a curious piece of grotesquerie, which together with the lid—a very rich network of quatrefoils filled with little domestic subjects—has not been photographed, owing to modern notions of seemliness—considerably altered since the 14th century.

These carved and painted chests, with their beautiful locksmith's work, were important pieces of furniture in the Mediæval living-room. They contained the best clothes—furred and embroidered, and bequeathed from father to son and mother to daughter—jewels and money and family papers. A well-to-do man would have several of them; one was usually placed at the foot of the bed and served the double purpose of "locker" and seat. You sat on your box, you took your lunch on it, you wrote a letter on it, you raised its lid and caressed your little possessions that lay in it; no wonder such chests were built with two or three stout locks and fitted with a good substantial key, so that no man could steal or meddle with the contents. The furniture of the chamber or parlour was scanty as aforesaid, though it was the room in which the master or mistress of the household might receive in more privacy than in the hall or "house." There was a bed with its hangings, one or two chests, a settle before the fire, a handsome carved chair, two or three stools besides the seats or niches in the walls themselves, a cupboard or dresser; a chandelier or candlestick hung, perhaps, from the roof with a pulley, and there were the fire-irons, the great dogs, or "chenets," for holding the fire together, tongs, &c., on the hearth. This sounds poor enough, but in reality the aspect of the room was distinguished, and even gay. Bright-coloured stuffs and embroideries lay about the settle and over the big bed; cushions there were to lean against, and the woodwork was prettily painted or carved in crisp ornament; the dresser shone with its burden of silver, silver-gilt, and pewter; the walls were either hung with cloths, or painted roughly but skilfully with subjects and ornamental work in flat colour, or covered with mere line-drawings in black, filled with red and yellow. The floor was often tiled with rugs or cloths, laid here and there, but oftener laid with rushes—a custom I frankly, wholly, and utterly condemn, even though on feast-days and holidays the fresh rushes might be strewn and mixed in sweet herbs and flowers. And a people that loved the woodlands and the sweet scents and the fresh blossoms so dearly never failed to adorn their chambers with flowers in summer and evergreen boughs in autumn and winter. But the fireside was the centre of the little home-circle; beyond it, in the long winter evenings, lay the chill twilight of another world. Here warmth and geniality spread from the great hearth, with the strong red glow that lay across the tiled floor, overpowering the uncertain flicker of the torches and candles that stood above the carved chimney-piece, or hung from a beam in the centre of the room. The furniture of this oasis of light and warmth received a great deal of attention; the fire-dogs were often beautifully-wrought iron-work, covered with grotesques or with the arms and device of the family interwoven with graceful leaf-tendrils. The settle before the fire, too, was sometimes ingeniously constructed with a movable back (like the garden-seat of a tram-car), so that the company who had toasted and scorched their shins sufficiently or too much could face round, screening themselves by a cloth hung over the back of the seat, through which only a gentle warmth would penetrate. Long baskets, too, stuffed with hay were provided, funny as it sounds, to protect legs from the fierceness of the fire.

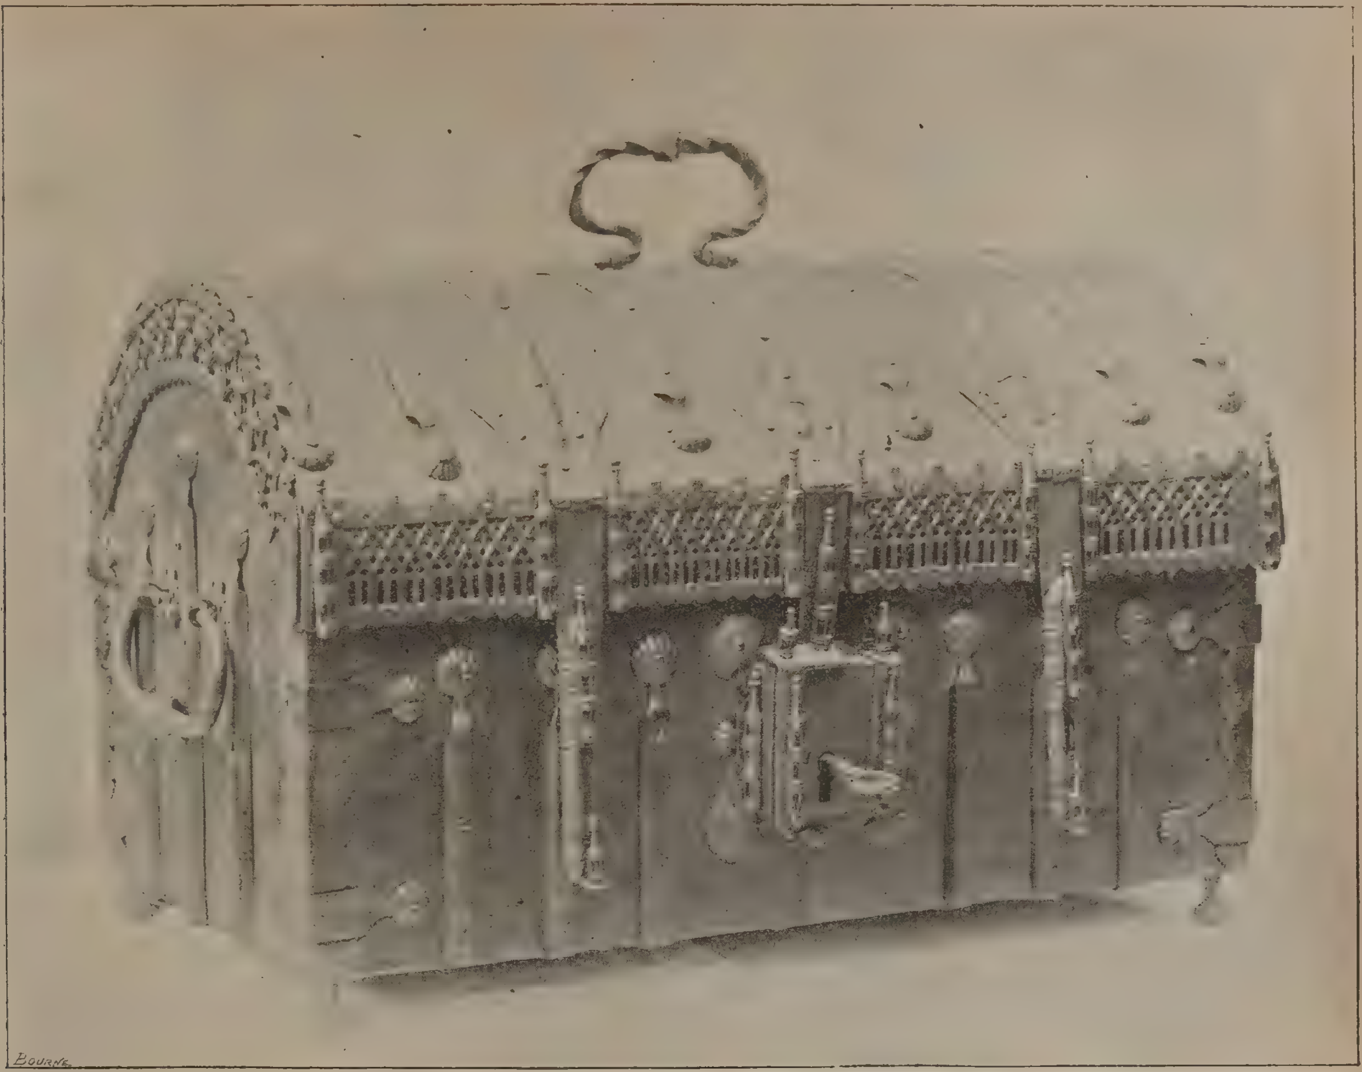
I have said little about mediæval beds, partly because I am trying—not with great success, I fear—to confine these notes on the life of the times within the precincts of the Cluny Museum, and the Museum possesses no bed of an early period. But it was the important piece of furniture in a living-room, with its display of costly hangings and cushions and counterpoints. Curiously described, too, are the old beds and their furniture by many a scribe and romance-writer. In the accounts of the Kings of France in the 14th century, the following picturesque paragraph occurs:—"For seven thousand trefoils of silver, of which the counterpoint, the *ciel*, and valences, and eight pieces were sewn between the parrots and butterflies; for silver and silk of which they were made, 4 deniers for the piece, making 116 livres 13 sols 4 deniers, &c., &c." This is for the Embroidered Room prepared for the coronation of Philip the Fair's wife at Reims, in 1317. For the same, the following item appears:—"For the making of 1,321 parrots, done in embroidery with the arms of our lord the King; for the work of three parrots, for gold, for silk of which they were made, and bread for the workers, 6 sols for the piece, making 396 livres 6 sols."

To judge by the minute and affectionate way some of the household goods are described in old wills and inventories, their owners had a considerable idea of their value, and entertained the thought of leaving them behind with some regret. Thomas Bath, a burgess of Bristol, probably a cloth-maker, gives a very pretty list of his personal treasures in 1420 when he makes his will. His godson comes in for a silver beaker with a knob on the top of it enamelled with blue. To him also a girdle of black silk lined with red leather, with a good buckle and pendant, which bears an image of St. Christopher, and "in the gurdill be xlvj. studs of silver." Item half-a-dozen silver spoons with acorn tops, over-gilt. A pair of andirons he gives him, too, the best he has. And mediæval andirons were no trifle, as I hope to be able to show you, from the Cluny collection. Katherine Lewis, his servant, comes in for a score of good things: a bowl that weighs 16¾oz., a silver beaker, a silver spice-dish over-gilt of xj.oz., a bowl of vij.oz. A girdle of silk also, black, green, and red, with a buckle and a pendant, and a chain in the pendant with a knob; "23 studs in the girdill all of silver." Basins and ewers and pans he leaves to Katherine, and four gold rings; quart pots, andirons, and iron broches or spits, chafers, a dozen pewter vessels, and four candlesticks of laton, of the best. Kate has also all his bankers and cushions and a hanging of "tamsery" worked with a hart in the middle. Somebody else gets a silver chalice cup and some other silver, also a "beam that I weigh with, and ij levys, also 3 hundred leaden weights." Then he returns to Katherine, who is to have three blue curtains, the best he has, to hang round a bed; and therewith the scribe wanders absent-mindedly into dog-Latin, and notes a "petit brase morter, a pestell de ferro." A priest, leaving his worldly goods for things celestial, bequeaths a bed of green silk, with tester and canopy of red and white-striped tartarin; a bed of green worsted, a blue bed "with the lion curtanis," hall-hangings, silver cups and pots, and other handsome pieces of silver, while all his personal goods, except for the legacies, were to be allotted to the Church in various ways for his soul's sake. One man bequeaths the contents of his chest, which must have been a large one, for it contains as many heterogeneous goods as the bag which Fairy Blackstick left with Prince Giglio; napery of all sorts, a white gown with a red hood, a blue gown with hood of red and black, a blue coverlet, a dagger, a bow, four purses, a pair of green hose, four nobles, and a cope. A wax-chandler's servant, of London, has a fair collection of pretty things—napery, silver, a furred gown and hood, cushions and hangings, crucifix beads, &c. He leaves, too, a little painted trestle-table, a little jointed stool for a child, and another, large enough for him to sit on, "whanne he cometh to mannes state; also a prymmer for to serve God with; also a litel cofur to putte in his smale thynges." This same child, his godchild, receives his painted chest. And certain neighbours witness the signing of the will: a grocer, a brewer, a hosier, and a tallow-chandler.

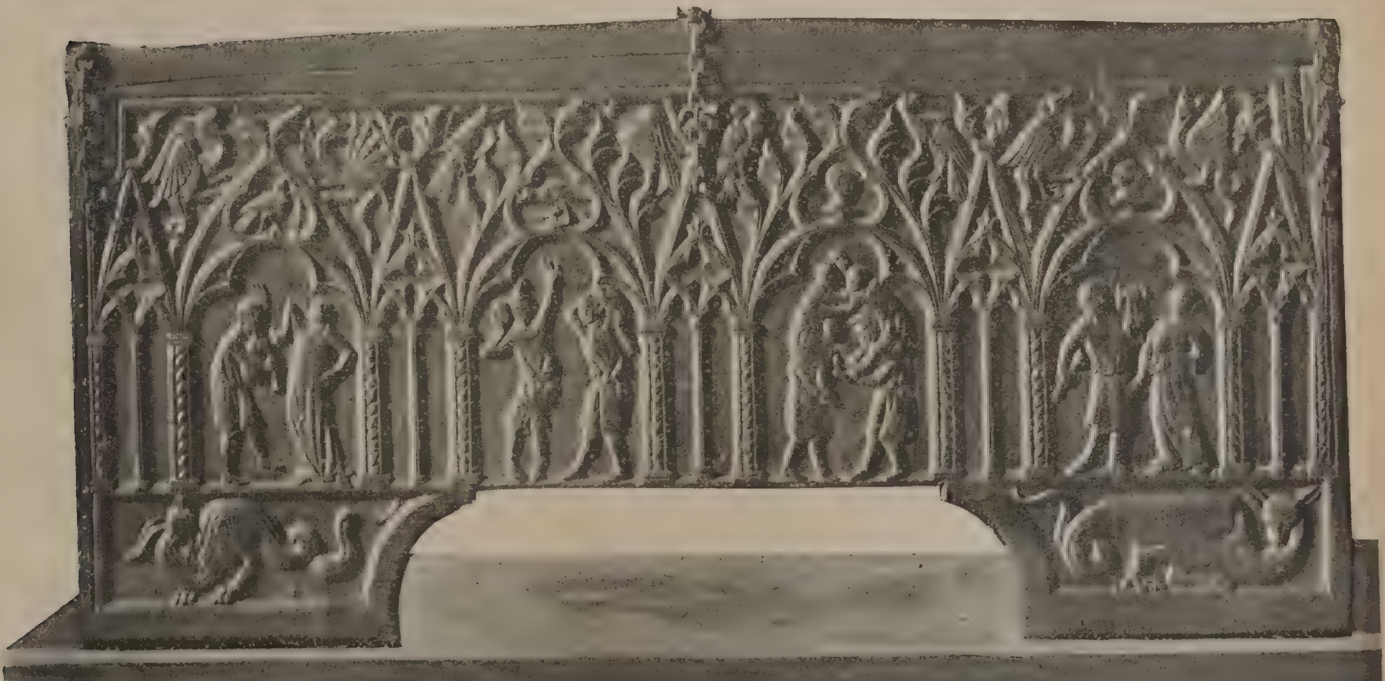
* * *

New church schools for St. Andrew's parish, Lincoln, were opened last week. Mr. William Scorer was the architect, and Messrs. H. S. and W. Close, also of Lincoln, were the contractors. The cost of the school, which provides accommodation for 250 children, was £1,150.

Messrs. John Sumners and Sons, of the Globe Ironworks, Stalybridge, have purchased upwards of 43 acres of land adjoining the new Hawarden Bridge and the River Dee, for the purpose of constructing extensive works for the manufacture of galvanised corrugated iron roofing-sheets, steel nail strips and sheets, and nails. The works are to be proceeded with at once, the contracts having been let. This is the commencement of an important industry, due to the construction of the Manchester, Sheffield, and Lincolnshire Railway, and the Dee and Birkenhead Railway from Hawarden Bridge, and it is expected that before long the whole river frontage will be taken up by similar works requiring large areas of land.



FIFTEENTH-CENTURY LEATHER CHEST, FROM CLUNY.



EARLY FOURTEENTH-CENTURY CARVED CHEST, FROM CLUNY.

KING'S COLLEGE CONVERSAZIONE.

On Friday, October 4th, the prizes at King's College were distributed by the Master of the Worshipful Company of Carpenters, Dr. Wace in the chair. Professor Banister Fletcher, being called upon by the chairman, said it was a great pleasure to be able to report continued progress, not only in the building construction lectures and classes, and in the studio, but also in the day and evening wood-carving classes. He gladly bore testimony to the earnest desire to learn by the students, and the thoroughness of the work done. The exhibition of some of the drawings shown that night would, he believed, convince those present as to this part of the work. The number of students are:—

	1894-5.	1893-4.
Professor Fletcher's Lectures	42	23
Constructional Drawing, under Demonstrator	42	24
Quantities, under Demonstrator	39	21
Architectural Studio, under B. F. Fletcher	12	6

Total number of students in above classes: 1894-5; 75; 1893-4, 42. The numbers in wood-carving were, in the day classes 20, in the evening classes 21, also showing a marked improvement. One of the professional papers has recently said, while praising the work which is being done there: "These classes form almost a college in themselves." To give some idea of the activity of the classes, the Professor mentioned that the number of drawings prepared in the constructional drawing classes was 273. The prizes, medals, and scholarships about to be distributed would also indicate some considerable exertion among the students, as also will the exhibition of the students' work in wood-carving. How, then, is this work, it may be asked, accomplished? The reply is, that the Worshipful Company of Carpenters helped with an annual endowment and prizes. That all the remainder of the expenses on the wood-carving classes is generously found by the late Master, Mr. Henry Harben. "It may interest you to know," the Professor said, "that no portion of the expenditure is found by the ratepayers. Lord Beaconsfield, in one of his clever sentences describing life, &c., dividing it into three periods, mentions that youth is a mistake, and doubtless he will continue to be right if youth is spent without utilising the great advantages it *now* has spread before it. Let it cheerfully avail itself fully of the splendid free technical museum and library, of the lectures, classes, and studio *here* provided. Then, I venture to think, it will prove youth is no mistake, and may enter its further stages with bright spirits and earnest hopes, being fully armed for the battle."

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

The inaugural meeting of the session of this society was held at the Cutlers' Hall on Wednesday evening, when there was a large and representative gathering of members and visitors, including many ladies. The rooms were filled with the pictures brought together by the Sheffield Society of Artists for the annual art exhibition, and there was also shown a valuable collection of prints and engravings of Renaissance art, lent by Mr. B. Bagshawe, and also the original draught of Fairbank's Map of Sheffield, *circa* 1771, and a fine copy, in three folio volumes, of Leon Battista Alberti's "Architecture," with other interesting books lent by Messrs. Ald. W. H. Brittain and J. B. Mitchell-Withers; the last named likewise lent the unique collection of engravings of Sir Christopher Wren's works, which belonged to the late Professor Cockerell, R.A.

The chair was occupied by the President, Mr. Charles Hadfield, F.R.I.B.A., who reviewed in brief the work of the year that has gone, and further indicated the more important aims of the forthcoming session. Mr. Hadfield remarked:—The recently-issued annual report shows the society to be in a sound condition. It has a substantial balance in the hands of the treasurer. It numbers 35 Fellows, 32 Associates, 15 students, and has, moreover, strengthened its ranks by the admission of five honorary members—viz., the Dukes of Norfork and Devonshire, the Earl of Wharncliffe, Mr. John Daniel Leader, F.S A., and Dr. H. C. Sorby, F.R.S. The ranks of the Society have also been strengthened by a newly-formed class of lay members, gentlemen outside who are interested in architectural pursuits. The lectures given during the session were of a high standard of excellence. One, by Mr. William Dickie, on "Wentworth House," was illustrated by a unique and valuable collection of 18th-century architectural drawings, many of which bore the signatures of H. Flitcroft, who was Sir W. Chambers's predecessor in the middle of last century as H.M.'s Surveyor of Works at Whitehall. Another lecture, by Mr. John Holden, President of the Manchester Society of Architects, on "Ancient Lights," was a singularly lucid and exhaustive contribution on this difficult subject. The classes of design, conducted by my predecessor, Mr. E. M. Gibbs, with so much zeal and thoroughness, have induced a feeling for work and study amongst the rising generation of architects, while the history and sketching classes, under Mr J. R. Wigfull's able guidance, are doing untold good to the students. During the past session the council has not forgotten the interests of the members in their relations with public bodies. Friendly correspondence and interchange of opinion have taken place with the Sheffield School Board, the late lamented town clerk, and others, on the vexed topic of "competition," and these interchanges of opinion have had due consideration given to them by the parties addressed, who have received them in the spirit which dictated them. The library list grows from year to year, and would grow much faster had the society a room of its own. This matter has not been overlooked, and is postponed solely for prudential reasons at present. During the past year, the eighth of the society's existence, the primary objects for which the society exists have been kept steadily in view—*i.e.*, "The acquisition of a knowledge of the various arts and sciences connected with the architect's and surveyor's craft; the education of the junior members thereof; and the consideration of questions of general practice." At the same time, let us not forget the motto of the society should ever be "Excelsior." Let me urge on younger members in all their pursuits to aim at a lofty ideal: ever to bear in mind the position and responsibilities they may have one day to bear, and by making use of the advantages they come across, to qualify themselves for the part they may have to fill. Vitruvius lays down "that an architect should be ingenious and apt in the acquisition of knowledge. He should be a good writer, a skilful draughtsman, versed in geometry and optics, expert at figures, acquainted with history, somewhat of a musician, and not ignorant of the sciences—both of law and physics." These ideas of Vitruvius clearly point to the exalted and responsible position of the architects of antiquity, and there is no doubt that in the 16th, 17th, and 18th centuries, men such as Brunelleschi, Alberti, Bramante, Peruzzi, Michael Angelo, Palladio, and Vignola, in Italy; Le Pautre and others in France; and our own Inigo Jones, Wren, Vanbrugh, and the like, lived up to much the same high standard. The present is an age of marvellously advanced draughtsmanship, and severe competitive examinations in every calling; but let me remind the young architect that brilliant draughtsmanship and the passing of examinations are but a means to an end. I have examined the drawings of some of the above-mentioned masters, and doubt if any of them would have passed muster at a South Kensington Science and Art examination in freehand or building construction; nevertheless, their authors immortalised themselves for all time by their works in marble, stone, and brick. They were workers and students to the end of their lives, and I hold them up as your pattern. You have well-organised classes for sketching and the measurement of old buildings, for land surveying, for historical study; the first and last named under a leader, whose achievements in measuring and delineating the north transept of Lincoln Cathedral brought him the well-earned and coveted distinction of the R.I.B.A. silver medal some two years ago. Let me suggest also, for your consideration, a work that ought to be no longer delayed – i.e., that of carefully drawing and measuring old local buildings and any architectural detail of interest they may happen to contain, with a view of issuing the drawings in book form to subscribers. This has been successfully done elsewhere. The German societies of architects make it one of their chief duties, and issue complete records of the buildings in their own immediate district. The Sheffield Guild of Arts and Crafts, through its president, Mr. C. Green, have already drawn attention in the Press to the lamentable destruction that has for some time and must necessarily continue to take place in this city of much that is worthy of record. Let us join hands with them before it is too late. There is now, at the eleventh hour, plenty of material to work on, and in gathering it in, you will be garnering rich stores of old decorative and building types, and at the same time cultivate your designing faculties. The 19th century has been a century of artistic and notably of architectural revivals in England and her colonies. A Frenchman thinks far more about the charm which his imaginative faculty teaches him to impart to his work, and its inherent character and interest, than of all the wretched shibboleths about historic style we are eternally proclaiming in this country and in America. Cannot we, once for all, delegate to the shades of oblivion the regulation phraseology of the day as to our buildings being designed in "Free Classic," "Early Gothic, freely treated," or "English Renaissance," or as to Mr. Jones being a Classic, and his rival, Green, a Gothic, man? To the architect who has learned the grammar of his art, the whole thing should be exquisitely absurd. Let the young architect in his hours of recreation go into the fields and woods with his colour-box and sketch-block, or scour the hills and dales of England with knapsack on his back. Let him make good use of his cycling powers, and he will find plenty of material to enable him to invest his own efforts with something of the charm and character that were inseparable from all periods of our old English architecture. When he has to undertake a building, such a course of study will tend to strengthen his faculty for original and artistic design. This is a commercial age, and an architect must train himself up to habits of system, hard work, and punctuality in his appointments. We have heard it asked lately if "Architecture be a profession or an art?" But there is little good to be gained by a parade of high artistic to the exclusion of commercial or professional ability, or *vice versâ*. The British public, as a rule, are quite shrewd enough to read between the lines, and say "A plague upon both your houses!" nor are they likely to value such attempts at transparent self-advertisement one wit more than those of the architect, who, posing as a sanitary specialist, adorns the front of his building with ventilating pipes and other interesting sanitary requirements, which a little trouble or forethought might have relegated to a less obtrusive position, without injury to efficient working. Do not take to heart the disappointments and the failures, the anxieties, the rebuffs, and the wearinesses that come to each one of us—to the most successful, as well as to the young struggling architect or student. Persevere! Use your thinking faculties, and lose no opportunity of attaining knowledge and experience, and you will find that, as a rule, the man who rises to his opportunity when it presents itself, and does his best, is the man who "goes in to win." To one, it comes in early life; to another (and he is often the more fortunate), during years of ripe knowledge and maturity; to a third, after long waiting and disappointments, when life's meridian is passed. Michael Angelo Buonarotti was fifty years of age when he put his hand to the gigantic task of shaping the Vatican Basilica. You may depend upon it that hard work, culture, practical knowledge, and skilful handling of difficulties will tell in the long run. The great moralist, St. Ignatius of Loyola, the founder of the Society of Jesus, was wont to inculcate in his disciples that heroic deeds performed were not necessarily to be more highly valued than the ordinary everyday work of life done extraordinarily well; and Longfellow has embodied the like sentiment in his "Psalm of Life."

CAST IRON IN BUILDER'S AND CONTRACTOR'S WORK.—VI.

By Joseph Horner.

I propose to indicate in the papers immediately succeeding the differences between good and reliable castings and those of an opposite character, and I will preface that subject with an object-lesson in moulding and casting which all can understand.

An engineer's specification for the quality of cast iron runs substantially as follows:—

"The castings shall be clean and sound, both externally and internally, and shall be carefully fettled and smoothed. They shall be free from scabs, blow-holes, honey-combing, cold shuts, draws, and other defects. No stopping up or

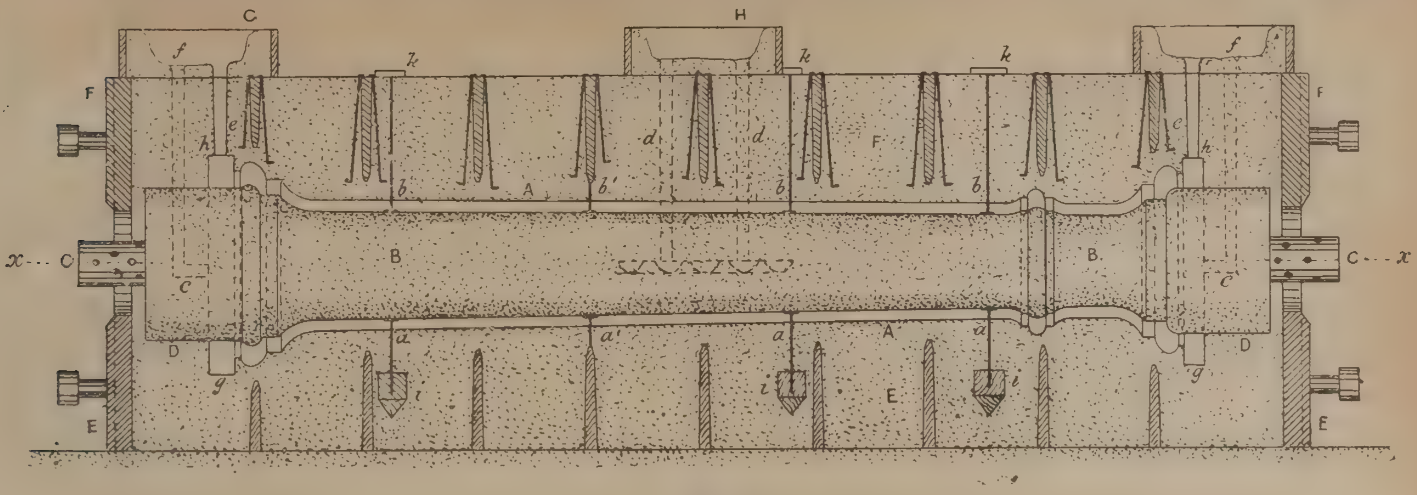


Fig. 15.

plugging is on any account to be permitted. No castings shall be made in open sand. Cores must be cast in accurately. No more than five per cent. variation in weight will be allowed on either side. The metal shall be remelted once in the cupola, and free from any admixture of cinder iron, or other inferior material. It shall be uniformly tough and close-grained. It shall be of such strength that a turned bar having an area of two square inches shall bear a tensile strain of not less than 16,000lb. to 18,000lb. per square inch without breaking. A test-bar 3ft. between supports by 2in. deep by 1in. thick shall bear a cross breaking strain of not less than 28cwt. to 30cwt., with a deflection of not less than ⅜in. or ½in. before breaking." There will be special clauses in some classes of work for engines and pumps, which do not concern us. It is to the consideration of these conditions that I wish now to invite attention, conditions which result from the nature of the material, the properties of which we have been studying.

The illustration, Fig. 15, represents a longitudinal section through a finished mould of a column, having a plain shaft and ornamental capital and base, which column is to be cast as it lies, namely, upon its side, as is the usual practice. The principal portions of the mould are the body of the mould, or the mould proper, A; the core, B, which forms the hollow interior, which core is struck upon a hollow core-bar, C, pierced with vent-holes. The core is laid in print impressions, D, at the ends, which completely encircle and confine the core at those localities in a position concentric with the mould. Along the body of the core, away from the ends, assistance is given by means of chaplet-nails, *a a′*, *b b′*, which are themselves variously secured, as we shall note presently. F and E are the two halves of the moulding box or flask, which are jointed along the plane *x—x*, coincident with the centre of the column, and of the core. They are guided into and kept in perfect alignment by means of round pins on E, fitting into holes in lugs in F; compare with Fig. 16. Cottars passing through the pins secure E and F together during the pouring of the metal into the mould. G H I are the basins for pouring, or for risers; but in the one figure I have indicated alternative methods of pouring, so that this portion of the illustration would not be correct for any one mould. Thus columns are poured in two ways at least, either at the ends in G and I, the runners being shown dotted at *c c*, to run into the flange faces, the two volumes of metal meeting at the centre of the column. This method would be the one generally adopted with long columns. With short columns, a usual plan is to pour at H, and not at the ends at all. The metal will enter by one, or two, runners, *d d*, and be distributed along the side of the column by means of a spray, shown dotted, having, say, from three to half-a-dozen entrance runners into the mould. Long, light columns are sometimes poured at G, H, and I, because it lessens the risk of the metal becoming chilled during its passage through the mould, and forming cold shuts. Usually, in either case, risers or flow-off gates are set over the highest parts of the mould. In this mould they should be set over the flanges, the positions of the risers being indicated at *e e*. Of course, risers and runners have their distinct basins. I have indicated this sufficiently by the full lines in the one, and the dotted in the other, the basins for the latter not appearing in the figure. I need not say more than this respecting these details, because all we are concerned with in this place are those broad influences which produce good or bad castings.

Such a casting as this may be faulty, due to unequal thickness of metal between the core B and the mould A, or to scabs, or to sponginess, or to blow-holes, or to cold shuts.

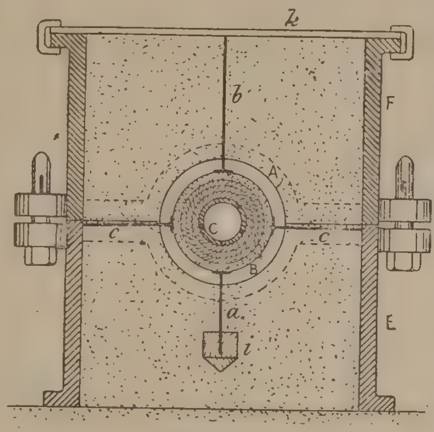

Fig. 16.

Unequal thickness of metal is caused by the liquid pressure shifting the core B in relation to the mould A. This hydrostatic pressure is very considerable in a mould. In specially deep moulds very great precautions are taken to counteract it. I have seen results that would have appeared almost impossible if they had not been seen. The tendency of a long core is always to rise in the central portions under the pressure of the liquid metal, and if this is not prevented by the use of stops, the casting will be weakened proportionately. If the metal should be, say, 1¼in. thick, and the core rises ½in., then it will be only ¾in. on the top side—the more open, or spongy side, too—and if this happens to come in tension, fracture is likely to occur. In this long column the pressure would be sufficient to raise and curve the core, spite of its stiff iron bar C, up to the top surface of the mould, leaving no room for metal. Hence the reason why the chaplet-nails are employed. Fig. 16 shows a cross section of the core confined by chaplets, *a*, *b*, *c*, *c*. Those marked *c c* are not visible in Fig. 15. They confine the core from movement sideways. These chaplet-nails consist of pieces of sheet-iron, bent in this instance to the curvature of the core, and riveted to stems. Fig. 17 shows two such nails enlarged. One, A, is of the kind used in cylindrical cores, the other, B, is for flat surfaces. The stems are prevented from moving by giving them a bearing against any suitable point of resistance. The side ones C C, in Fig. 16, are made to bear against the flask-sides E. The bottom ones are often driven into chaplet blocks of wood, *i*, Figs. 15 and 16, rammed in the sand. The top ones either take a bearing against a bar as at *b′*, as *a′* also does below; or they bear against a return-bar, or against plates *k* clamped across the flask, as at *b b*. If these chaplet-nails are properly secured by these methods, the core cannot move unless the nails melt out, which seldom happens in metal of average thickness. When metal is very thick, other methods are adopted, as solid cast stops; but these do not concern us. Fig. 17 illustrates the stops used in columns, and they are sufficient. So that when a core is out of centre, it must either have been set inaccurately, or have become moved by reason of the insecure fixing of the chaplet-nails, and this does often happen.

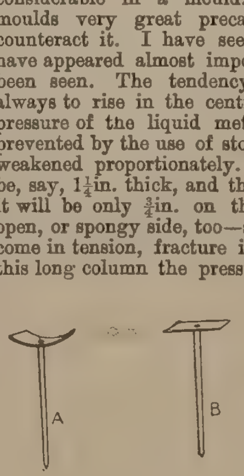

Fig. 17.

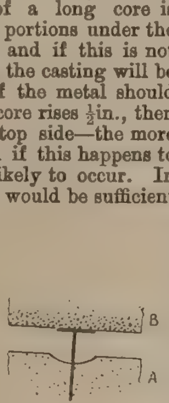

Fig. 18.

There is no objection to the use of chaplets in columns, as there is in hydraulic cylinders, and if the work is securely done there is no risk of the cores rising, and if the chaplets are tinned there is no risk of blowing. If chaplets are not used, a very stout core-bar that will not spring must be employed, as is done in hydraulic cylinders.

In connection with the subject of chaplet-nails there is a little dodge, the reason for which I have been sometimes asked by people—viz., the presence of the tiny swells or bosses which occur at intervals on the bodies of many columns and pipes, Fig. 18. These are made by the moulder in order to slightly increase the thickness of metal around the stems of the chaplet-nails, and thereby lessen risk of porosity there. When the metal in the body of a pipe or column is thin, it cools quickly, scarcely giving time for amalgamation of the hot metal with the cold stem of the chaplet. Slight blowing, too, is apt to occur, causing the metal to be porous there. So the moulder just presses the rounding end of his trowel-handle into the sand previous to the insertion of the chaplet-nail, and thus increases the thickness of the metal by from $\frac{3}{16}$in. to ¼in. there, causing the slight swell, or boss, in the casting.

In reference next to scabs, blow-holes, and general sponginess, these have a family relationship. The pressure due to the distance from the top, *f*, of the runner *c* to the lowest part of the mould, *g*, is much greater than that from *f* to *h*, the highest part of the mould. The consequence is that the metal is always more dense at *g* than at *h*. Also, all the lighter metal and air-bubbles, and scurf, or dirt are buoyed up, and carried to the highest parts of the mould. If there are no risers, the dirt cannot come out, but will remain in the casting, and general sponginess will result on the upper side of the casting.

If the sand of the mould is not sufficiently pierced with ample vent-holes for the escape of gas and air, this, too, will collect along the top face, and cause blow-holes. If the mould is also rammed too hard, and insufficiently vented as well, flakes of sand will be washed away from the surface of the mould, and, being washed about, will become entangled in the metal, producing hollow spaces, leaving extra metal at the parts flaked off, termed scabs.

We are now in a position to understand the reasons that produce these graver faults in castings, the appearances of which I shall endeavour to illustrate.

SEWAGE PURIFICATION WORKS.

A DESCRIPTION of the Eccles Sewage Purification Works at Grange Farm, by H. Leonard Hinnell, F.C.S., A M.I.C.E., engineer, of Manchester and Bolton, is before us. The works have been in progress since 1893, and are now completed. They provide the borough of Eccles with a system of sewage treatment, which has been devised by Mr. H. Leonard Hinnell, F.C.S., the engineer. Many sewage works and various systems of treatment were inspected, and at length a site of twenty-eight acres at Salt Eye was offered—a low-lying site. The engineer approved of the situation. He observes: "The level of the land above Salt Eye Brook and outfall sewer was so very slight that only one system of treatment was feasible, unless the sewage was backed up in the sewer or pumping resorted to. This was the international system of sewage purification, and consisted of treating the raw sewage with chemicals in precipitation tanks, and then subjecting the resulting effluent to pass through artificial filter-beds 3ft. deep, before discharging into the river; the alternative system suggested being chemical treatment in tanks, with subsequent filtration through land specially drained." The Barton Grange Estate was acquired at a low cost for the more complete treatment and purification of the sewage by establishing a sewage farm with settling tanks. The Local Government Board inspector considered the purification of sewage on land the best, and on his recommendation the Grange Farm was purchased by the Eccles Local Board. He also proposed that all storm and surface waters should be diverted into the streams and water-courses, instead of allowing it to enter the sewers, and increase cost of pumping. Plans were prepared for a scheme, the cost of which was estimated at £13,794. A sewage farm, consisting of a pumping station to raise the sewage into settling tanks, from which it would pass to the land; a destructor to consume the refuse and sweepings, the heat from which to be utilised in generating steam to provide power for pumping the sewage, were contemplated. The Local Government Board approved of the sewage farm scheme, and sanctioned the borrowing of a sum of £13,560. The Council proceeded with the sewage farm works, Messrs. Bentley's tender of £10,449 being accepted. Plans were prepared and tenders received for the sewage farm buildings, and that of Messrs. J. Gerrard and Son, of Swinton, was accepted; also a tender for machinery for pumping-station by Messrs. Nasmyth, Wilson, and Co. These works have been executed and the purification scheme completed, and full details are given of the several parts of the scheme. The works are about a mile from the town, and the land obtained is over 71 acres. The sewage flows to these works. The main outfall sewer is 4ft. diameter, and daily discharges from a population of 32,000 an average volume of sewage of 1,000,000gal. Any excess of storm water is discharged direct into the streams. The sewage passes through a screen into the catchpit; thence the pumped sewage passes into conduits and flows through side openings into detritus tanks, where the sand and heavy matter will be retained. It then passes slowly through trapped outlets into the settling tanks, in which sills and weirs are provided to assist precipitation. From the end of these tanks the supernatant effluent falls in a thin film into a discharge conduit to a series of underground carriers. The process operates thus:—The organic matter is decomposed by the action of micro-organisms dissolved and carried in solution into the soil, where it is converted by bacteria in their life processes into nitrates and nitrites, and in which state it is assimilated by vegetation. The detritus passes into pipes which convey it on to the sludge filter-beds, and soon becomes fit for spreading on the farm land. The carriers conveying the effluent from the tanks to the land are glazed stoneware socketed pipes, 18in. to 24in. diameter, jointed with caulked gaskin and Portland cement, and these supply 35 distributing chambers, 3ft. 9in. square each, from which by valves and sluices the effluent can flow into the land which has a subsoil of sand and loam, thence after being purified into the brook.

CHIPS.

The city council of York received at their meeting on Monday a report stating that the payments for recently-completed works of sewerage and sewage disposal amounted to £190,350.

A stained-glass east window has been erected in the parish church of Kirk Smeaton, to perpetuate the memory of the late rector, the Rev. R. Hicks. The subject is the Ascension.

The additions to the Newark Town Hall, consisting of new municipal offices, hall-keeper's residence, and justices' retiring room, are now completed, and heating apparatus has also been added. The town council obtained a loan of £990 to enable them to carry out these improvements, and application has been made to the Local Government Board for sanction to borrow a further sum for furnishing.

In the monthly report to members, Mr. F. Chandler, the secretary of the Amalgamated Society of Carpenters and Joiners, states: "From the returns to hand we incline to the belief that employment is fairly good in all branches of industry in which our members participate, and although experience has taught us not to be too sanguine of being free from troubles even in the last quarter of the year, yet, so far as we can foresee, there are no indications of any serious disputes occurring in connection with our trade."

The directors of the Exeter Electric Lighting Company have decided to accept the City Council's offer of £7,500 for their works.

Messrs. George Lawson and Son, of Glasgow, have secured the contract to construct a new aqueduct in connection with the Glasgow water supply from Loch Katrine. The tender is £40,450.

At a meeting held at the Masonic Hall, West Bromwich, it was decided to take steps to build a new permanent church near St. Philip's mission room. Mr. Kendrick (Messrs. Wood and Kendrick, architects) presented plans of the proposed church, which, when erected, will provide accommodation for 988 persons, and altogether will cost about £7,000.

The death is announced of Mr. John Booth at his home, 60, Bank-street, New York. He was born in Aberdeen in 1839, and before going to the States in 1867 he carried on an extensive insurance business in his native city. After reaching New York he soon entered into partnership with his brother William, and built up a large trade in granite under the name of Booth Brothers and the Hurricane Gale Granite Company. Mr. Booth, who was unmarried, has left an estate of about 100,000 dollars in personal property.

A special meeting of the Margate Town Council was held on Tuesday week, to receive the applications for the post of assistant borough surveyor. There were 101 applications sent in, and these having been read and considered, it was decided, by nine votes to four, that Mr. F. Latham, the son of the borough engineer, be appointed.

The annual exhibition of students' drawings at the Royal Female School of Art will take place to-day (Friday) and to-morrow, at 43, Queen-square, Bloomsbury. This collection includes the works of the recipients of the Queen's Gold Medal and Scholarship of £60, the Scholarships of the Mercers', Clothworkers', the Brightwen, and National Gilchrist, the National silver medal, the National bronze medal, and other prizes.

The official inspection of the electric tram line from Old Market-street, Bristol, to Kingswood took place on Wednesday in last week, when Major Marindin, R.E., and Major Carew visited the city on behalf of the Board of Trade. They were met by Mr. Joseph Kincaid, the company's engineer; the British Thomson-Houston Company, who have carried out the equipment, being represented by Mr. W. R. Blackwell, C.E., Mr. Philip Dawson, C.E., and Mr. James Devonshire, the general manager. Major Marindin proceeded over as much of the road as is in the city, in company with Mr. Yabbicom, the city engineer, subsequently inspecting the St. George portion with Mr. Lewis, the surveyor to the St. George District Council, and that in the Kingswood district with Mr. Powell, the surveyor to the Kingswood District Council. The formal opening took place on Monday.

At the last meeting of the Belfast Corporation the efficiency of the main drainage scheme, now in course of completion, was the subject of discussion. Mr. Bretland, the borough surveyor, expressed the hope that the additional storm overflows provided in the Shankhill district would greatly minimise, if not altogether prevent, flooding there in future. He also gave some general explanations as to the working and effectiveness of the scheme.

OBITUARY.

Mr. William Wetmore Story, the well-known sculptor, poet, and author, died on Monday, in his 76th year, at the country house of his daughter, the Marchesa Peruzzi, at Vallambrosa, near Florence. Mr. Story was the son of the celebrated Judge Joseph Story, Chief Justice of the Supreme Court of the United States. In early life he practised at the Bar, but abandoned that profession on the death of his father, and went abroad to study sculpture. His first successes in his art were the marble statues of Cleopatra and the Libyan Sibyl which were exhibited at the London Exhibition of 1862, and are now prominent features in the decoration of the hall of the Goldsmiths' Company. We illustrated both figures, together with the grand staircase of the hall where they find a permanent home, in the Building News for April 5 of the present year. Among his many public commissions were the Peabody statue in front of the London Royal Exchange, the statue of his father for Cambridge, Massachusetts, and that of Colonel Prescott for Bunker's Hill. He was art commissioner at the Paris Exhibition of 1878, and was an officer of the Legion of Honour. In 1887 he received the honorary degree of D.C.L. at Oxford. He had four children, one of whom died in early life. His eldest son, Waldo, is likewise a sculptor, and his second son is Julian, the well-known painter. For the last 40 years he has lived in Rome.

Mr George Culley Ashmead, who for more than half a century carried on the business of a land surveyor in Bristol, died on Wednesday week at his residence, Alma Vale-road, at the advanced age of 94. As far back as 1850 the deceased was appointed, with the late Mr. Wm. Armstong and Mr. R. S. Pope, to make a valuation of city property in Bristol for assessment purposes; in 1860 he was associated in similar work with Mr. R. S. Pope and Mr. W. Sturge; and in 1870 he acted in a like capacity with Mr. Sturge and Mr. Josiah Thomas. As a land surveyor, he had business connections with assessment authorities in many prominent cases, and he purchased for the Midland Railway Company the land which they required for constructing the branch to Thornbury. All his life Mr. Ashmead had been connected with the Baptist denomination, was identified with the work of the Baptist Itinerant Society, and frequently preached at some of the chapels in the district. He retired from business some years ago, leaving it in the hands of his two grandsons. Mr. Frederick Ashmead, late borough engineer of Bristol, and now consulting engineer to the Bristol Sanitary Authority, is a son of the deceased.

On Michaelmas Day there was dedicated at Shifnal, Salop, a reredos, given in memory of the Rev. Henry Cunliffe, for 32 years vicar of the parish. The reredos is a triptych of oak, richly gilded. The three panels are occupied by paintings on a gold ground. The central panel has as its subject the Crucifixion, with the figures of St. Mary and St. John. In the north panel are the figures of St. Peter and St. Andrew; in the south panel are St. Chad, first Bishop of Lichfield, and Bishop Selwyn. The reredos was designed by Mr. J. Oldrid Scott, F.S.A.

Two new board schools were formally opened in the Water district of Rossendale on Saturday. The cost of the new buildings has been £4,500. One is at Water, and will accommodate 390 children, inclusive of 153 in the infants' department. The other school is at Waterfoot, and will accommodate 448 children, inclusive of 120 in the infants' department. The buildings have been designed and carried out under the personal supervision of Mr. Thomas Bell, architect, Burnley. The chief contractors were:—Excavators and masons, Mr. W. Coupe, Waterfoot; carpenters and joiners, Mr. J. Greenwood, Bacup; and slaters, Mr. O. Whitaker, Burnley, and Mr. H. Tomlinson, Rawtenstall.

The work of preparing the new park at St. George, near Bristol, is in progress. The site comprises about forty acres, and it is situated between the St. George main road and Whitehall-road. The land was purchased from the Ecclesiastical Commissioners by the district council for £12,000, and about £6,000 will be spent in laying it out. A portion of the work has been done by local labour, under the superintendence of the council's surveyor, and subsequently a contract was entered into with Messrs. Thomas and Webb for levelling. The excavations for the lake, the area of which will be two acres, have been let to Mr. F. Martin, and the tender of Mr. S. C. Harrison, of Milk-street, Bristol, has been accepted for the wrought-iron fencing, with which the park is to be inclosed.

ILLUSTRATIONS.

VARIOUS DRAWINGS OF THE FIRST, SECOND, AND THIRD PREMIATED DESIGNS FOR THE NEW WEST HAM TECHNICAL INSTITUTE AND PUBLIC LIBRARY. — ROOD LOFT AND CRUCIFIX FROM A FRENCH CHURCH.—WAREHOUSE AND BATHS, RUSHDEN, NORTHANTS.

Our Illustrations.

WEST HAM TECHNICAL INSTITUTE AND PUBLIC LIBRARY.

To-day we devote the whole of our lithographic plates to the further illustration of the premiated designs in this public competition. The view, plans, and detail of the selected design were published in our issue of last Friday, and now we print corresponding reproductions of the three elevations, thus giving our readers practically a complete set of Messrs. Gibson and Russell's chosen drawings. The second prize design by Messrs. Clark and Hutchinson, and the third premium design by Mr. Thomas Davison are both represented by views, elevations, and plans, affording ample material for a ready comparison of their relative merits, and enabling the reader to study these schemes to which Mr. MacVicar Anderson, the professional adjudicator, awarded the posts of honour from the 75 sets of plans submitted. It is not necessary to enlarge upon these designs here, as we have already remarked upon their leading characteristics, and it is to be noted that special care has been taken in reproducing the architects' drawings to carefully render their work in such an adequate manner as to insure justice to their originals, and that in a way not to be found elsewhere.

ROOD LOFT AND CRUCIFIX.

The lower portion of this sheet of sketches illustrates the two inclosures once forming staircases to a rood-loft in an old French church. The work is panelled and richly carved, and belongs to the period about 1500, and as such examples are rare, the interest attaching to them is correspondingly great. The arcading connecting the two staircases did not originally form part of the design, although of much the same date. A fine specimen of the carver's skill is the crucifix, with emblems of the four Evangelists, which, with the exception of damage to the delicate tracery on the arms of the cross, and some of the crockets, is in an excellent state of preservation. Accompanying this rood are the two figures of SS. Mary and John, the hands being missing from both statues. These objects are some of the most valuable amongst the recent acquisitions made by the Museum authorities at South Kensington.

WAREHOUSE AND PROPOSED BATHS, RUSHDEN.

The warehouse at the angle was finished some time ago for Messrs. Lilley and Skinner, Ltd., as a leather store. The building to the left shows a scheme for a proposed swimming-bath, the site being on a "quick" slope. The entrance to the bath is on the extreme right at the level of the first floor. The architect is Mr. A. Sykes, A.R.I.B.A., of 34, Walbrook, London, E.C.

COMPETITIONS.

Belfast.—The committee for the erection of a cathedral for Belfast have decided to request the President of the Institute of British Architects to nominate an assessor, whose fee shall be 100 guineas, and who will draw up the conditions. Six architects, to be selected by the assessor, will be invited to send in competitive designs for a cathedral, and will be paid a fee of £50 each. In addition, premiums of £75 and £50 will be given to the authors of the designs placed first and second. A singular provision is that other architects than those selected will be at liberty to send in designs, but such will not be allowed any expenses; but if an outsider's design is placed first or second, the author will be dealt with as if he had been invited to compete. The cathedral, which is to be built in sections as funds allow, is not to exceed in cost £100,000, exclusive of foundations, and the nave and its aisles are to seat 1,500 persons.

Bowness.—The united committee of the Bowness and Windemere District Councils have selected the plans sent in, in open competition, by Mr. Robert Walker, F.R.I.B.A., architect, Windermere and Lancaster, for a joint hospital for the district.

Derby.—The Special Purposes Committee of St. Thomas's Church, Derby, have selected the design of Mr. F. W. Dixon, of Guardian Buildings, Manchester, and Union-street, Oldham, submitted in open competition, for proposed new parish hall and Sunday-school. The selected design shows a Late Gothic treatment in red brick and terracotta, with a rich tracery window in terracotta towards the main road. The coping to gables, &c., will be in Matlock stone, while the inside joiner's work will be in selected pitch-pine, and the windows glazed with leaded lights. A combined system of heating and ventilation will be adopted upon a low-pressure basis. A caretaker's house is also included in the scheme.

Scarborough.—In the competition for a proposed new infirmary and additions to the Scarborough workhouse buildings, at an estimated cost of £7,800, the assessor, Mr. Keith D. Young, F.R.I.B.A., of Southampton-street, Bloomsbury, W.C., has selected the designs submitted by Mr. William E. Barry, A.R.I.B.A., of Wimbledon, and it is proposed to submit the plans to the Local Government Board for approval.

York.—At Monday's meeting of the city council, the markets committee reported that after careful consideration of the designs submitted for an improved market stall, they had awarded the premium of £10 10s. to Mr. H. Woodhouse, M.I.C.E., of Liverpool. The report was adopted.

* * *

A new Liberal club, built at a cost of £4,500, was opened at Kingston, Halifax, on Saturday. In addition to that part of the building let off for business purposes, there are a lecture-hall, billiard-room, and ante-rooms.

The Lord Provost's Committee of the Edinburgh Town Council have accepted tenders for the work in connection with the erection of a dome on the Calton Hill for the accommodation of the large telescope and other astronomical apparatus belonging to the city. The cost will be a little under £2,200. Mr. R. Brownlee, of Colinton, Edinburgh, will execute the builder's work, and Sir Howard Grubb will supply the fittings.

A residence for students of divinity at Edinburgh University is about to be opened at No. 14, George-square, Edinburgh, which has been adapted for its new purposes from designs by Mr. James Jerdan, architect, of that city.

The First Sea Lord of the Admiralty, the Controller of the Navy, and Sir Evan Macgregor, Permanent Secretary to the Admiralty, examined on Friday the plans and inspected the site of the extension at Keyham, near Devonport, to provide docks for the largest war vessels afloat, and in connection with which a quarter of a million sterling is to be spent this year.

The memory of Mr. William Bolitho, of Ponsandane, West Cornwall, who died about ten months ago, will be handed down in Gulval by several mementos. The whole of the seating of Gulval Parish Church (new not long since, and now presented to Tregony Church) is being replaced by carved oak seats; a memorial pulpit of marble and alabaster will further perpetuate the name of a churchwarden for many years; and the piece of mosaic pavement, given a short time since by Lady Fitzgerald, is to be extended throughout the sacred edifice. An altar-tomb is also to be constructed for the Bolitho chapel at the same church.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Institution of Junior Engineers.—The annual general meeting of this Institution was held last Friday (Oct. 4) at the Westminster Palace Hotel, the retiring chairman, Mr. H. J. Young, taking the chair at eight o'clock. The principal business was the presentation of the council's report on the proceedings of the past year, and the election of officers for the ensuing session. The report showed that steady advancement had been maintained. The membership roll had increased by 45, the total at the present time being 418. At the seven monthly meetings the average attendance had been 78, and at the 13 "London and neighbourhood" visits the average was 82. The Belgian summer meeting was highly successful. The Institution Premium for the best paper read by members during the session had been awarded to that on "The Warming of Buildings by Hot Water," of which Mr. E. King and Mr. Kenneth Gray were joint authors. The library had been well used, but its utility could be greatly increased by the provision of a reading-room, which, together with an office, the council were hoping they would soon be able to secure. An office fund had been opened for the purpose. The total receipts on general account had been £487 1s. 2d., and expenditure £474 3s. The result of the election was:—Chairman, H. J. Young; vice-chairman, H. B. Vorley; hon. librarian, H. Kempster; hon. auditors, W. H. De Ritter and B. H. Joy; members of council, A. Anstruther Thomson, G. F. Buret, B. H. Joy, and E. King. Remaining in office, H. G. Church, W. B. Clarke, S. Cutler, and A. H. Dykes.

CHIPS.

At the Darlington Town Council, on Friday, Dr. Manson stated that the amount of the accepted contract for building the Technical Institute was £9,328 13s., some hundreds below the architect's estimate. The tenders had been secured by Darlington tradesmen. The total cost, including furnishing and architect's commission, would be £11,321 18s.

An appeal is being made by the Vicar of New Shoreham for £2,000 for the repair of the fine tower of the parish church. Mr. Benjamin Ingelow, F.R.I.B.A., recently reported that the condition of the tower was most insecure. This was confirmed by Sir Arthur Blomfield, A.R.A., who urged that no time should be lost in making it temporarily secure. This has been done, and the committee have given instructions to Mr. Thompson, of Peterborough, to proceed with the work of underpinning forthwith.

Mr. James A. Campbell, M.P., opened, on Friday the St. James' Public School, which has just been erected in Green-street, Calton, East-end, by the Glasgow School Board. The new school is designed in a Classic style, and is three stories in height. It gives accommodation for 1,400 scholars, and has, in addition to the ordinary schoolrooms, accommodation for the teaching of cookery, washing, and laundry work. Its cost, including the site, was £28,000.

At the Tonbridge Police-court on Tuesday week, Mr. George James Jones, builder, of Waterloo-road, Tonbridge, and a member of the Tonbridge Urban District Council, was summoned by Mr. Frank Oldfield Hartley, Tunbridge Wells, assistant district auditor, of the South-Eastern Counties Audit District, for not attending an audit of which he had notice, as an allotment manager. A nominal fine of 10s. and 9s. costs was imposed, it appearing that defendant, who kept the accounts gratuitously, had objected to the short notice given of the proposed audit.

Mr. A. S. Barnard, electrician to the Lancaster Corporation, has been appointed from a list of 57 applicants to succeed Mr. Gibbings as electrical engineer to the Hull Corporation, Mr. Gibbings having moved to Bradford. Mr. Barnard's salary is £250.

The new echo-organ erected in the triforium of Westminster Abbey, and connected with the main instrument by electric wires, will be opened at the Purcell bi-centenary service in the Abbey on Nov. 21. The proceeds of the service will be devoted to a fund for providing a case for the great organ, towards which the Dean and Chapter have already voted £500.

The memorial-stone of the north aisle, which is about to be added to the parish church of Walsall Wood to supplement a southern aisle which was added to the church some few years ago, was laid on Monday. The work is being carried out by Messrs. Cresswell, from designs by Mr. H. E. Lavender, and additional accommodation will be provided for 130 persons. The cost will be £800.

Building Intelligence.

Aberdeen.—New police-offices for Aberdeen were formally opened on Friday. The site is in Lodge Walk, and on the spot occupied by the Aberdeen prison, which is now located at Craiginches. Communication between the Municipal Buildings and the police offices is provided by a passage carried over the courtyard. The principal entrance to the premises is in the centre of the main building, and it gives access, through a vestibule, to the charge room. The cell block is divided into two portions and constructed on the gallery system. There are twenty-four cells in the male division and twelve in the female. The officials' and magistrates' rooms are well appointed, while the system of electric bells and telephonic fittings is complete. The muster-room measures 40ft. by 80ft., and is 18ft. high, and the court and stable yards are provided with a stable, coach-house, mortuary, and lavatories. Reading and recreation-rooms are provided for constables, and there is a gymnasium on the second floor of the muster-room wing. A bagatelle table and other forms of recreation are provided, and adjoining the gallery are lavatory conveniences and a bath-room for the policemen. The architect of the new offices was Mr. John Rust, jun., the city architect, and the outlay has been £13,000.—The new buildings for the Sailors' Institute have just been opened. The expense of the additions amounted to about £3,000. The building consists of three blocks, one with frontage to Mearns-street, another to James-street, and a central block. The style of the Mearns-street front is Renaissance. It is faced with Kemnay granite. The chief feature of the James-street elevation are a large overhanging window and the entrances to the mission, bank, and Navigation School. The building contains dining, lounge, and smoke rooms, bank and meeting room, also keeper's apartment on the ground floor. On the upper floor, a hall seated for 250, a chapel seated for 100, with retiring-rooms and board-rooms. On the second floor are twelve sailors' bedrooms and two officers' bedrooms, and on the third floor are two large dormitories for shipwrecked crews; lavatory and bath accommodation is provided. The large rooms are heated by hot-water pipes. The masons were Alex. Milne and Son; the carpenters, Watson and Robb; the slaters, Alex. Adam and Co.; the plasterers, J. Stephen and Son; the plumbers, John Blaikie and Son; the painters and glaziers (including stained-glass windows), Gordon and Watt; the heating engineers and ironmongery, James Laing and Co.; furnishings, Pratt and Keith, J. and A. Ogilvie, and J. Allan and Sons. The whole buildings have been designed and superintended by Mr. James Souttar, architect, Aberdeen.

Bangor.—At the University College of North Wales a lecture hall for the normal students was opened on Tuesday. It stands on the west side of the main building, and covers an area of 80ft. square. The large lecture-room is 50ft. by 30ft., and when the partitions are removed so that the corridor and the two classrooms, each 22ft. by 24ft., can be utilised, a lecture-hall is provided. The flooring is concrete, and the walls are built of 5in. timber, the felting being intermediate between the boards and the outside slating. The walls are plastered inside, and there is a boarded ceiling. It is to be heated by Musgrave's coke and gas stoves; the gas fixtures were furnished by Mr. T. Powers, Manchester; the Educational Supply Association and Messrs. W. and T. May, Sheffield, being intrusted with the internal fittings. The contract was let to Messrs. Jones and Williams, Hirael, Bangor, at £967, and the works have been carried out from the designs and under the superintendence of Mr. Richard Davies, architect, Bangor.

Beverley.—New casual wards and porter's lodge have just been completed at Beverley workhouse. They have been designed in a similar style to the new infirmary erected last year, and adjoin the workhouse. The principal elevation faces Union-road, and comprise the porter's lodge (which has the female receiving room and wards behind) and male wards to the right, between which and the porter's lodge is the entrance archway (over the main road to the workhouse). The casual wards provide accommodation for 41 vagrants, 29 males and 12 females. They consist of an associated ward affording sleeping accommodation for 20 males, and nine sleeping cells, eight of which have stone-breaking cells attached. There are also six covered stone-breaking bunks in the yard. On the female side is an associated ward for eight females, and sleeping cells for four. There are also receiving rooms, bath-room, and drying-rooms for clothes for both male and female divisions. The administrative department, which consists of the porter's lodge and office and the female attendant's room, is to the left of the entrance gates. The cells are approached from a central corridor; each cell and associated ward has communication by means of gong with the attendants in charge. The premises are heated throughout with Perkins's high-pressure heating apparatus. At the end of the male wards is the stone yard. There is also a disinfecting room and apparatus. The architects are Messrs. Hawe and Foley, and the contractor Mr. J. R. Foley, all of Beverley.

Ipswich.—At the meeting of the Ipswich board of guardians held on Friday, it was decided to adopt the amended plans prepared by Mr. W. Lister Newcombe, of Newcastle-on-Tyne, and Messrs. S. Salter and Percy D. Adams, of London, acting conjointly, and to whose design when submitted in the recent competition the first premium of £100 was awarded on the recommendation of Mr. Charles Barry, F.S A., of Westminster, the assessor. The several plans were ordered to be submitted to the Local Government Board for their sanction, and Mr. J. Sidney Parminter was appointed as quantity surveyor at a commission of one per cent.

Kelvinside, Glasgow.—The memorial stone of Kelvinside United Presbyterian Church was laid on Saturday by Lady Bell. The style of the new church, which occupies a site at the corner of Queen Margaret Drive and Kelbourne-street, is Late Decorated Gothic. A lofty gable forms the principal feature of the front. The gable is flanked by angle piers, which are carried up in plain masonry to 40ft. from the ground, above which the surface is enriched with cusped panelling up to the cornice, terminating with crocketed angles and carved finials, the total height being about 60ft. Between these piers the whole space is filled by a mullioned window of seven lights recessed under a deeply-moulded arch. Internally, the church is planned for over 750 sittings, of which about 500 are on the area floor. The limited site necessitated both side and end galleries; but these have been kept narrow, and the roof has been designed in a single span, avoiding obstruction from columns. Above the coved ceiling the roof is of open construction, the wood principals being moulded. The western end is divided into three bays by stone piers and arches, in front of which is the pulpit platform, with the organ chamber beyond. The choir will be arranged in front of pulpit, where the organ console will also be placed. Behind the church are vestry and other accommodation. The estimated cost of the church is about £5,000. The work has been designed and is being carried out under the charge of Mr. John B. Wilson, A.R.I.B.A. and I.A.

Ocle Pychard.—The foundations of the interesting church of St. James's, Ocle Pychard, Herefordshire, having developed signs of failure, the committee have consulted Mr. F. R. Kempson, architect, of 138, Widemarsh-street, Hereford, who has recommended that the whole of the foundations should be reconstructed. This is being done by day-work under the architect's directions, Mr. Bufton, of Ocle Pychard, acting as clerk of works. The vestry walls, which showed grave signs of settlement, have been carefully underbuilt, and a heating chamber constructed below. The greatest care is being taken to preserve all the ancient work.

St. Alban's.—The parish church of St. Peter, at St. Alban's city, was re-opened on Friday, having been reconstructed at the sole cost of Lord Grimthorpe, who, as in the case of the neighbouring cathedral church, stipulated for being granted absolute and undisputed control, and acting as his own architect. The central tower fell in 1801, and five years later £6,000 was expended in rebuilding it in brickwork, with wooden windows, in sweeping away the transepts, and in recreating the chancel; the nave of six narrow bays, built in Late Perpendicular days, remained till the present time. Lord Grimthorpe has rebuilt the north aisle 4ft. wider, and the west front 15ft. farther west, adding a seventh bay to the nave; and the chancel about as much farther east, and adding 45ft. long of vestries, with a new entrance to the church between them. The whole length inside is now 142ft., the width of the nave 52ft., and the height 40ft. The chancel and the new Lady chapel are 23ft. 4in. in width. The church will now hold from 700 to 800 adults, instead of 500. All the walls have been rebuilt of mixed bricks and flints, like most of those at the cathedral. The tower alone is repointed, with the addition of square buttresses at all the corners, with Ancaster stone quoins, and a new crown of pinnacles and parapets, making it 108ft. high, and somewhat overtopping the much larger cathedral tower, by reason of being on higher ground. All buttresses and refacing have been built in cement, to avoid the risk of the new work shrinking and splitting off. The interesting monument of Edward Strong, Sir Christopher Wren's foreman during the 36 years rebuilding of St. Paul's Cathedral, remains undisturbed at the east end of the north aisle. The roofs are all new, the old ones having been condemned as ruinous. The main ridge is raised sufficiently to make it visible outside, and the clerestory windows and most of the wall, which had perished through long admission of wet, can now be partially seen over the aisle parapets, kept down for the purpose. The new west window is circular, replacing a Perpendicular one. The pattern of the new wheel window is unique in having 14 divisions in the outer ring, and therefore seven in the inner, which admits of more variety than numbers divisible by four, which prevailed in most, or all, the old large "rounds" everywhere. The chancel fittings are all new and massive. The pulpit, said to be Flemish, has been renovated, and the nave fittings are the old ones re-made on a plan much easier for sitting and kneeling, as far as they would go, and new ones added in the aisles. The organ has been re-made and enlarged by Messrs. Kirkland, of Holloway-road, and formerly of Wakefield.

Sheffield.—The vacant land in the central streets at Sheffield is being rapidly taken up. Two more plots have been disposed of in Pinstone-street, and there is now only one remaining unsold. The experiment of Mr. Reuben Thompson, of providing artisan dwellings at the top of his new premises, has been attended with so much success as to be speedily imitated. Similar provision has been made in the new buildings now being erected by Messrs. Laycock in the same street, and in new premises about to be put up close by flats of a better description will be provided. It is hoped to have most of the new property in this street completed by the time the new Town Hall is ready for opening. The remaining vacant plots of land in Church-street have gone off very rapidly at the last moment. Messrs. Bush and Son are putting up a fine block of buildings next to the Reform Club, as auction and show-rooms and offices. On the next site Messrs. Maxfield, solicitors, are erecting an imposing block of offices. The two plots at the top have just been secured, one by Messrs. Holmes and Watson, architects, and the other by a firm of solicitors. The work of widening High-street is proceeding, and when that is complete the centre of the city will have undergone a complete change.

CHIPS.

The town council of Birkenhead have resolved to adopt the Baths and Washhouses Acts.

Mr. Rienzi Walton, an inspector to the Local Government Board, held an inquiry at the Scarborough Town Hall on Wednesday week relative to the application of the town council for sanction to borrow £5,865 for street and other improvements, sewerage, &c.

Canon Barnett, of Toynbee Hall, has offered to raise twenty thousand pounds towards the cost of a town hall and art gallery at Whitechapel, provided the district board takes up the scheme and holds half-yearly picture exhibitions.

Mr. Robert Nightingale, a well-known Essex artist, died in London on the 3rd inst. in his 81st year. He exhibited at the Royal Academy as far back as 1846; and he was subsequently a frequent contributor to the Academy and the Suffolk-street galleries. His best works were horses and dogs, but he also enjoyed some distinction as a portrait painter. He was an intimate friend of the late Sir Edwin Landseer and of Mr. T. Sidney Cooper, the veteran Academician, and others.

The directors of the London and South-Western Company are about to make important alterations at Basingstoke station, and to widen the line from the junction upwards, to enable the Exeter traffic to be carried on without coming on to the Southampton line.

Engineering Notes.

East London Waterworks.—The Civil and Mechanical Engineers' Society visited, on Oct. 2, the new and old works of the East London Water Co. at Walthamstow. The existing reservoirs belonging to the company cover an area of 220 acres and the line of shore is 10 miles in length. The new works of the company, under their Act of 1894, consist of—(1) the construction of two large reservoirs; (2) the raising of the old Racecourse Reservoir 9ft. in height, so as to enable the depth of water to be increased to 20ft. (the water area will then equal 65 acres); (3) the construction of a road; and (4) the construction of filter-beds and high-service reservoirs. The two new reservoirs are being constructed by Messrs. John Aird and Sons, the water area of which will equal 80 acres; the depth of water in these reservoirs will be about 20ft The reservoirs will be connected with one another by means of tunnels, and the flow of water between them will be regulated by valves. The additions to the Racecourse Reservoir are being carried out by Messrs. Kirk and Randall, and this latter work will be completed in about a month's time, the contractors executing the work two months under their contract time. There are three filter-beds at this station; also a deep well into the chalk, the water from which is lifted by a differential pumping engine. A new triple-expansion pumping engine and a new centrifugal pump and engine will be erected here, the latter pump being capable of lifting 50,000,000 gallons a day. Other works are designed, and will be carried out as early as possible.

Lancashire, Derbyshire, and East Coast Railway.—The work of constructing the Langwith and Beighton branch of the Lancashire, Derbyshire, and East Coast Railway has made great progress during the last few months. The Langwith and Beighton branch commences in the parish of Langwith Basset, terminates near Killamarsh, and is about 11 miles in length. From Langwith to Clowne the line is practically finished. The Langwith Colliery branch, which is one mile in length, will be completed in a few weeks, and coal will then be put on the railway for conveyance to the Lincoln districts. A branch to the Staveley Colliery, which is also about one mile in length, is finished. Work on the Chesterfield section is in a forward state. The Bolsover Tunnel is over two miles in length, and about two-thirds of it is completed. The line is finished from Langwith Junction to the Warsop Main Colliery.

Rattray Head, N.B.—On the evening of Monday last a light was shown for the first time from a lighthouse which has been erected on the Ron Rock. This tide-covered rock lies about a quarter of a mile off Rattray Head on the east coast of Aberdeenshire, nearly midway between Buchanness and Kinnairdhead lighthouses. Kinnairdhead was built in 1787, being the first lighthouse erected by the Northern Lighthouse Commissioners, and Buchanness, which was lighted on May 1st, 1827, showed the first flashing light exhibited from any lighthouse. The new Rattray Head tower, as designed by Mr. David A. Stevenson and erected by Mr. David Porter, Aberdeen, is in two stages; the lower portion is 50ft. in diameter and 42ft. in height, constructed of heavy granite blocks outside and Portland cement concrete inside. Above this, the tower, 44ft. in height, is of composition brickwork, surmounted with a coping of granite, the total height of the structure being 86ft. On the granite coping is fixed a light-room of cast-iron plates, and a lantern with diagonal astragals of gunmetal. The lower tower has two stories; the under one contains the engines for compressing the air for actuating the siren, and in the upper floor are placed the air-receivers and siren. The foghorn is placed on the seaward side of the roof of the lower tower. The upper tower is divided into four stories—the coal and water store, the dry store, the third the kitchen, and above it the bedroom. Mr. Porter began operations on the rock in April, 1892, and before the end of July, 1894, the tower was completed. When the masonry was completed, Messrs. Milne erected the light-room and lantern. This allowed the internal fittings of the tower to be proceeded with. During the present season the optical apparatus and machinery for causing it to revolve have been erected, the former being made by M. Lepante, Paris, and the latter by Messrs. Steven and Struthers, Glasgow. The optical apparatus consists of nine panels of refracting prisms, the focal distance of the lenses being 3ft. The lenses subtend an angle of 80° vertically, this large angle being attained by using Mr. Charles N. Stevenson's bi-convex equiangular prisms above and below the lenses. These prisms render unnecessary the use of flint-glass, which causes great loss of light. The introduction of these prisms is novel, and results in a saving of from 15 to 20 per cent. of light. The height of this optical apparatus is $5\frac{1}{2}$ft., and the diameter 6ft. The panels show a group of three flashes in quick succession every half-minute; the power of the beam of each flash is equal to over 39,200 standard candles. The siren will give two blasts in quick succession every three minutes. The dwelling-houses for the keepers and their families are erected on the mainland, near the Head.

Railway Improvements in Birmingham.—Extensive structural changes have been in progress on the lines of the London and North-Western and Midland Railways where they converge on the southern side of Birmingham, for the past twelve months. When the joint station was enlarged a few years ago by the construction of a new station for the Midland Railway, side by side with the old one built by the London and North-Western Company, substantial improvements were effected in the northern tunnel approaches where the congestion of the traffic had been most conspicuous; but the south tunnel remained unaltered, except for the construction of a wider bell-mouth opening towards the Midland station. Up to the present, therefore, the twin stations, having together six main platforms and fourteen sets of metals, were dependent upon their south, or London side, on an outlet consisting of a single tunnel with one up and one down line, and beyond the tunnel the number and arrangement of the converging lines have been a source of constant anxiety. About three years ago the present scheme took practical shape, the London and North-Western Company undertaking the work, and the cost being apportioned between the companies. The first step was to do away with a level crossing where the Grand Junction line and the Curzon-street sidings intersected one another. A viaduct, for which Messrs. Nelson and Co. were the contractors, has been built for this portion of the passenger line, to carry the passenger traffic overhead until it is clear of the goods lines. The viaduct is built partly of brick arches and partly of iron girders, at a cost of about £35,000. The Midland trains, as they come in from Saltley, will pass under the North-Western line and gradually rise until they run level with and side by side with the London main line. The Midland suburban line will also be brought into direct connection with the new Midland loop. By the making of the new tunnel through the heart of the city these new independent approaches will be continued into the station. The new section when completed will consist of a double set of rails running through a tunnel 280 yards long, and about 10ft. to the south of the old line. The extensions have involved heavy work in the widening of bridges, the lowering of roadways passing under them, and the building of strong retaining walls at various points. The new system will be in full operation next Easter. The work is being done under the joint plans of Mr. Francis Stevenson, of the North-Western, and Mr. J. A. M'Donald, of the Midland Company, Mr. E. M. Smith being the resident engineer. For the work of widening between Gloucester Junction, where the Midland suburban line comes in, and the point at which the tunnelling under the city begins, Mr. J. T. Firbank, M.P., has been the contractor; while the new tunnel is being constructed by Messrs. Holme and King, of Liverpool. The cost of the actual excavating, with the building, platelaying, and other constructional work, will amount to over £100,000; but the total cost of the scheme, including compensations and other incidentals, will not be less than a quarter of a million.

◆

The Great Northern Railway of Ireland invited tenders for the glazing of the new station at Londonderry and Belfast arrival and departure platforms, and the tender of Messrs. W. E. Rendle and Co., of Westminster Chambers, has been accepted.

The members of the Sanitary Institute inspected the Wimbledon sewage works on Saturday, and on Tuesday evening Professor Wynter Blyth lectured before them on the subject of the "Sanitary Laws and Regulations Governing the Metropolis."

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—F. G. Lewin.—M. J. R. and Co.—Subscriber.—C. F. (Ashford).—C. J. W.—F. Langdon.

Correspondence.

ELEVATIONS OR PERSPECTIVES AT THE R.A.

To the Editor of the Building News.

Sir,—With reference to your leader on the above subject in your issue of Sept. 27, I shall feel much obliged if you will allow me to observe that architectural designing is a graphic art, and that poetry, music, and the drama are not graphic arts.—I am, &c.,

Llanelly, Oct. 1. R. F. Chisholm.

PROPOSED COUNTY INTERMEDIATE SCHOOL, WELSHPOOL.

Sir,—I received some two weeks ago a letter from one of the governors inclosing the advertisement inserted in your paper, and suggesting that I should compete for the above. In my reply, I pointed out that no promise of employment was made to the selected architect, and that the £20 premium would represent only part commission on a cottage, and I therefore declined. I had a reply, in which it was stated that the governors could not think of binding themselves to the employment of the architect placed first, as they might not like his design, and that the £20 was offered to prevent his being *disappointed in such a case!*

In replying, I pointed out that in competitions we risked a good deal, and it was just to expect a building committee to bind themselves to something satisfactory to us; that if the conditions were fair and reasonable, the result would probably please them; but as they stood now, it was very probable that they would be disappointed.

Now, Sir, it seems highly advisable to let the public see that we are resolved to safeguard our interests in these matters by not competing unless it is laid down that the architect whose design is selected shall carry out the work, and if it falls through, shall be paid a sufficient premium to pay him for his trouble. Can we blame the public for holding in very low estimation men who are willing to compete under such degrading conditions? I think not.—I am, &c.,

Swansea, Oct. 6. Hrrbert W. Wills.

THE LATE MR. HENRY SMITH.

Sir,—I notice in the list of works quoted in your obituary of Mr. Henry Smith a most important omission. He acted as surveyor for the whole of the buildings for the "Fourth Middlesex Asylum" (Claybury Asylum) at Woodford, Essex, for the London County Council, the total cost of which amounted to about £425,000.

Kindly make this fact known in your next issue, and oblige.—I am, &c.,

James W. Macey, Chief Clerk.

8, John-street, Adelphi, Oct. 9.

The Peterhead Harbour Trustees on Tuesday received a report by Sir A. M. Rendal, engineer for the Loan Commissioners, on the application of the Trustees to borrow £44,000 for extensions and improvements, in which the plans prepared by Mr. Shield, Harbour of Refuge Works, who was employed as engineer to the Trust, were largely modified. It was unanimously agreed to adopt the suggestions of Sir A. M. Rendal, and to restrict the application to £35,900; and, in anticipation that the loan would be granted, to prepare plans and specifications, Mr. Barron, C.E., Aberdeen, being the engineer.

The memorial stone of a new Congregational church in Stoney-lane, Sparkbrook, Birmingham, was laid on Saturday. The building, with which considerable progress has already been made, will be in the simple Gothic style, and will be capable of seating about 400 people. Provision has been made for subsequent enlargement by the addition of side aisles, which will bring the accommodation up to 600. The internal dimensions will be 55ft. by 39ft. with a transept. Land has also been reserved at the rear for future extensions in the shape of vestries and schools. Mr. George Ingall, of Birmingham, is the architect.

The theatre at Barnstaple was reopened on Wednesday week. It was built in 1835. For the past two years it has been closed, and for a considerable time previous to that it was used by the Salvation Army. The feoffees of the Barnstaple Long Bridge, who are the proprietors of the theatre, decided that the building, which had got into a most dilapidated condition, should be rearranged, and it has accordingly been almost rebuilt. It is capable of seating 600 persons. The decorations are by Mr. Martin Croot, and the whole of the furniture and appointments have been supplied by Messrs. Symons and Sons. Messrs. Sanders and Ridge carried out the alterations, the architect being Mr. F. W. Petter.

The institution which has been erected by Mrs. Priestman at New Hurst, Newcastle-on-Tyne, in memory of her husband, the late Jonathan Priestman, was publicly opened on Saturday afternoon. The building, which is situated at the south end of the village, is of red bricks, and is carried out in the Scottish Baronial style; it contains a library, reading, billiard, and general rooms. The cost of the building was £1,800. It has been built from plans by Mr. Charlton, of Ashington, by Messrs. Douglas, of Blyth.

The new cemetery for Whitchurch, Salop, at Mile Bank, was dedicated on Wednesday week. The new burial ground is three acres in extent, is about half a mile from Whitchurch, and occupies rising ground. The grounds are inclosed by a stone wall, and a caretaker's house containing a room for burial board meetings is built on an eminence in brick and half-timber. The architect was Mr. Walter Webb, of Whitchurch, and the builder Mr. Powell, Prees. Messrs. Smith and Son provided the palisading for walls, and the work has been carried out under the supervision of Mr. Baxter, surveyor to the urban council. The total cost amounts to £,150.

The Norwich Corporation, through their Technical Education Committee, have bought extensive premises adjoining the free library and school of art. The price paid was 3,000 guineas.

For the Staniland board schools, Boston, Messrs. Fambrini and Daniels, Architectural Concrete Works, Lincoln, have secured the contract for the whole of the stone dressings in their cream-coloured concrete masonry, comprising moulded sills and string-courses; bonded and moulded jambs; pediments, consoles, corbels, keystones, finials; moulded and ramped copings, &c. General contractor, Mr. H. W. Parker, Boston; architect, Mr. Jas. Rowell, of the same town.

Intercommunication.

QUESTIONS.

[11436.]—**Steel Joists and Iron Joists.**—Would some reader kindly say how one can know steel joists from rolled iron joists?—P. M.

[11437.]—**Concrete Floor.**—I am about to erect a stable on first floor of a building, and should be glad to know, in calculating the strength of floor, what weight per foot super. should be allowed. My own idea is to put 7in. by 2¼in. steel joists 2ft. apart, 10ft. bearing, filled in with coke breeze and cement concrete, 9in. thick, finished with paving bricks or granite concrete. Would a floor of this description be strong enough to allow for the weight and kicking of horses? In what proportion should cement be to coke breeze? What is the safe load per foot super. for coke breeze concrete 9in. thick, and bearings as above?—Safety.

CHIPS.

A new boys' school is being erected near the Old Porte Wall, at Chepstow, to accommodate 226 boys. The walls are built of red sandstone, with Box Ground dressings, mullions, and transoms. The plan consists of one large schoolroom, three classrooms, with corridor communicating with each. The contractor is Mr. John Linton, of Newport, Mon., and the contract price is £2,545.

The vestry-hall at Chiswick has just been renovated, and was reopened on Saturday. Messrs. T. Adamson and Sons, of Chiswick, were the contractors.

The east window of Burghill Parish Church, Herefordshire, has been filled with stained glass. The central light contains a representation of our Lord as the Good Shepherd.

A Local Government Board inquiry was held at Hull, on Thursday in last week, by Mr. Rienzi Walton, C.E., with reference to the application of the corporation for permission to borrow £8,000 for purposes of electric lighting. The amount is required to meet the requirements necessitated by the increased demand for the light.

The Godalming Corporation have decided, by the casting vote of the mayor, to acquire the waterworks, at a cost of £48,000. A resolution to obtain a provisional order for the installation of the electric light was also carried.

On Saturday afternoon Sir H. G. Reid laid the memorial-stone of a new church which the English Presbyterian body are erecting at Heathfield-road, Handsworth. The cost of the building and site is estimated at about £5,000, and accommodation will be provided for a congregation of four hundred. Mr. J. P. Osborn, of Birmingham, is the architect.

A new organ has just been erected in the West Hampstead Congregational Church, Finchley-road, at a cost of £1,446.

Mr. W. J. Bird Clerk, M.I.C.E., an inspector from the Local Government Board, held an inquiry at the Town Hall, Cowes, on Friday, into an application of the Cowes Town Council to borrow £500 for the purposes of water supply and sewerage. The surveyor explained details and plans.

The town council of Cheltenham have decided to advertise for designs for municipal buildings to be built on the Winter Gardens Estate, and to offer a premium of £100 for the best design.

Dr. Danford Thomas held an inquest on Tuesday at St. Pancras, concerning the death of Frederick Conder, 57, land and estate agent, vice-chairman of the Biggleswade School Board, of Brook House, Biggleswade, Beds, who poisoned himself while staying at the Midland Hotel. It was shown that deceased was depressed owing to financial troubles, and the jury returned a verdict of Suicide during mental distress.

On Wednesday week, a new Wesleyan Methodist chapel was opened in Percy-street, New Swindon, by the President of the Wesleyan Conference, the Rev. D. J. Waller, D.D. The chapel, which will accommodate 520 persons, has been erected at a cost of £1,085. The builders were Messrs. J. and G. George, and the architect was the late Mr. Thomas Lansdown, who died recently.

The four new forts for the defence of Lough Swilly are being rapidly proceeded with under the supervision of Captain St. John, Royal Engineers. Three of the forts are on the Innishowen side, while the fourth occupies a commanding position on Inch Island.

Sir Arthur Arnold, chairman of the London County Council, opened the new Putney School of Art on Wednesday week.

A new Wesleyan chapel is in course of erection at the corner of Pine and Shaw-streets, Pits o' th' Moor, near Bury, from plans by Messrs. Brockbank and Green, architects, of Liverpool. The chapel is Gothic, treated in brick and terracotta, and is seated in pitch-pine for 700 persons. The builders are Messrs. Thompson and Brierley, of Bury, Lancs.

Legal.

WHAT IS "AN INTEREST IN LAND"?

The defence of the Statute of Frauds still keeps cropping up whenever one party wants to get out of a contract for which the other has not taken care to provide a written and signed document. Probably the legal construction of this old statute of Charles II. has wasted more money and encouraged more fraud than any other odd hundred Acts of Parliament put together. The idea of the statute was that by requiring a written note of an arrangement made affecting an interest in land, law-suits would be prevented and fraudulent claims discouraged. But the effects have been entirely otherwise. A recent wretched little dispute from a County Court was taken up to the Queen's Bench Divisional Court, upon a point of law raised under this well-meaning old statute. The plaintiff had let a field to the defendant, verbally, for three Bank-holidays, for the purpose of its being used to set up a steam hurdy-gurdy, at the one round sum of £45. The defendant took possession of the field for the first holiday, and paid the plaintiff something on account; but for some reason or other he did not want the field on the two following holidays, and did not take possession of it, although he could have done so. Then the plaintiff sued for the balance of the agreed sum in the County Court, and the defendant set up as his defence the Statute of Frauds, contending that, as this was an agreement affecting an interest in land, it should have been in writing, and so was void.

The County Court judge overruled this far too ingenious defence, and fortunately the Divisional Court has now been able to confirm that decision. The judges held that the verbal arrangement amounted to one letting at a lump sum as rent for the three specified days. The defendant entered on one of these days and paid a sum on account of the whole agreed rent. In order to support an action for use and occupation an entry by a tenant was enough, and it was not necessary to prove his continuous occupation during the whole period. So the Court got out of the strict letter of the ancient statute by holding that the plaintiff could recover the balance owing as for the use and occupation of his field, and thus maintain his action, although there had been no such written agreement as is needed when an interest in land is affected. Still, it is better to put these things in writing. **Fred. Wetherfield, Solicitor.**

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

W. H.—Contract.—Architect.—Deduction.—Ask him for an account, which should be furnished. If you can show that the amount deducted is so excessive as to be fraudulent or collusive, you might dispute his decision upon that ground. But you would have to prove the fact very clearly.

Puzzled.—Local Council Work.—Liability.—I consider the Council's surveyor had full authority to order this work to be done, as the need was urgent in view of the public safety, and upon that basis you should summon the Council for the money owing, and call their own surveyor as one of your witnesses.

By the death of Mr. J. T. Rodda Camborne has lost one of its most prominent inhabitants. He was for fifteen years steward to Mr. W. Cole Pendarves, and previous to his appointment to that office he was engineer and secretary to Camborne Waterworks Company, which appointment he had held from the inception of the company. The building the reservoirs, laying the mains into the town—a distance of four miles—and supplying the house services at Praze, Camborne, Tuckingmill, and Pool were done under his direction and superintendence.

At the Guildhall Art Gallery, E.C., on Monday an interesting collection of drawings by old masters was inaugurated. It will continue open during the winter months from 10 till 4. The collection, which has been lent by Sir Charles Robinson, includes drawings from the pencils of Titian, Raffaelle, Rembrandt, Vandyck, Rubens, Albert Dürer, Hans Holbein, and Michaël Angelo.

A faculty has been obtained for the erection of an oak screen at the entrance to the chancel and north chancel aisle at Penshurst, the cost being defrayed by Lord Hardinge. A faculty was also obtained for partially restoring Ruckinge Church at a cost of £550. The parish church at Wrotham, Kent, is also to undergo repairs; three dilapidated windows in the north aisle are being now restored.

WATER SUPPLY AND SANITARY MATTERS.

The East London Water Supply.—Further evidence was heard by Col. W. M. Ducat, R E., and Dr. F. W. Barry, inspectors of the Local Government Board, on Thursday, Friday, and Saturday last, as to the causes of the deficient supply of water in the East-end parishes of London from June to August last. Mr. A. R. Binnie, principal engineer to the London County Council, stated that he had prepared tables showing the total quantities supplied by the East London Water Company in 1892, and for the five months of 1895. In 1892 the average daily supply was 43,561,270 gallons; in 1893 it was 41,901,868 gallons; in 1894 it was 41,396,448 gallons; and in 1895 for the first five months it averaged 53,010,513 gallons a day. For the five months of 1895 the total excess from February to June over the preceding year was 1,501,232 gallons. The flow of the river Lea was not in any way below the average, and yielded ample supplies. The cause of the shortness of water was not from an insufficiency of supply, but arose from something which occurred in February. This was evidently the great frost, which burst the pipes, and the damage was not repaired down to the end of June. He considered that the company already possessed sufficient storage reservoirs, and he altogether condemned the river Lea as a source of supply. On behalf of the East London Water Company, Professor Symonds, Dr. W. R. Smith, and other expert witnesses were called to prove that the drought in the Lea valley had been exceptional this year, and that the failure of supply in the East-end had not affected the public health. On Friday most of the sitting was occupied with the evidence of Mr. W. B. Bryan, for the past 14 years engineer to the East London Water Company, who attributed the scarcity to the drought in the Lea valley, which had diminished the flow of the river Lea to an enormous extent. But if he had had sufficient storage there would have been no deficiency. The contention of Mr. Binnie, the engineer to the London County Council, that the scarcity was due to the shattering of mains by the frost of last winter was, in the judgment of the witness, entirely erroneous, and based on ignorance of the facts. All the company's broken mains in the London district were repaired by the 8th of April, and in the country districts all the broken mains were restored by the 19th of April. There could not possibly have been any waste to the extent of 20 per cent. from shattered mains after the dates given. In May and June there was an immense increase in the consumption of water, and that arose from the enormous number of lead pipes which burst, so that plumbers could not be found in sufficient numbers to repair all within two or three months.—The inquiry concluded on Saturday, after addresses by counsel. Mr. Pember, for the water company, threw the blame of the recent dearth of water upon the County Council for opposing, for political reasons, the increase of the company's storage. Mr. Balfour Browne, representing the East-end vestries, denounced the attitude taken up by the company as beneath contempt, and asked the inspectors to report to the Local Government Board that the real remedy for such calamities as had occurred was to transfer the water supply of the Metropolis to some public body. Colonel Ducat intimated that he and Dr. Barry would inspect the storage works of the company and some of the fittings, and then make their report.

The Relative Value of Percolation Gauges.—At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, Mr. W. G. Peirce, President, in the chair, a paper on this subject was read by Mr. Reginald E. Middleton, M.Inst.C.E. The object of of author was to examine into the relative value the percolation gauges situated at Nash Mills, Lea Bridge, and Rothamsted, both as regards the records of each, their reliability when compared with other sources of information, and the evidence which is afforded as to the quantity of rain water which may be assumed to pass into the underground reservoirs which supply the wells and rivers. It was shown that there are remarkable discrepancies between the records of the gauges themselves, and that the percentage of rainfall which percolates does not appear to be consistent throughout, although the water percolating follows the record of rainfall more closely than is generally supposed to be the cace. Mr. Middleton next endeavoured to produce evidence from two other sources—namely, from the varying levels of the water in two wells, and from the gaugings of the rivers Thames and Lea, confirmatory of the general conclusions arrived at from the records of the different percolation gauges. The results obtained have been tabulated, and although they do not agree between themselves entirely nor with the records obtained from percolation gauges, they yet afford some evidence generally confirmatory of the results recorded by those gauges, and the differences are probably due rather to a failure in obtaining a proper ratio of discharge in the one case and to a general rather than a particular consideration of the circumstances in the other than to any inaccuracy in the method adopted. In the case of the river the evidence obtained appears to be of value, especially as indicating that, unless the amount of water which percolates into the underground reservoirs has been very largely over-estimated, the rivers do not discharge the whole or anything like the whole of the water collected in the underground reservoirs, but that a very large volume passes away through some other channel and is available for purposes of water supply. This volume, in the case of the river Lea, amounts to some 75,000,000 gallons, and in the case of the river Thames to the enormous quantity of 697,000,000 gallons daily. In illustration of the discrepancies, it was mentioned that if the years 1860 to 1866 of the records kept at Nash Mills and Lea Bridge be compared with those from 1866 to 1873, it is found that the Nash Mills gauge passed, during the former period, 23 per cent. of the rainfall, and that at Lea Bridge 29 per cent. was passed, while in the second period the Nash Mills gauge passed 19 per cent. and the Lea Bridge gauge 29 per cent. If the two gauges at Lea Bridge and Old Ford, which are placed about 2½ miles from each other and are under the same management, be compared, it is found that the percentage of rain passed by that at Lea Bridge between the years 1875 and 1890 is 30·4 per cent., while at Old Ford it is only 25·2 per cent., and in many years the difference is far greater. Similar results are arrived at by an examination of the other gauges. The smallest percolations are, for a one-year period, about 37 per cent. of the average, or 3·37in. of rain; for a two-year period 45 per cent. or 4·10in., and for a three-year period 60 per cent. or 5·46in., the average percolation being taken at 9·10in. of rainfall, while there is a large amount of evidence to show that the average percolation is not less than 10in. of rain.

The Edinburgh New Waterworks.—At a meeting of the works committee of the Edinburgh and District Water Trust on Monday, considerable discussion arose on the question of the measurement of the new Talla works in connection with the preparation of schedules. The principal point was whether the work should be done under the direction of the trust engineer, or should be placed in the hands of an outside ordained surveyor. Ultimately it was agreed that the work should be done by the engineer, and that ½ per cent. on the total cost of the works measured should be allowed him for remuneration.

◆

We learn that Mr. Edmund Law, F.R.I.B.A., F.S.I., architect and county surveyor, Northampton, has taken into partnership his head assistant, Mr. Sidney F. Harris, A.R.I.B.A. The practice will now be carried on in the name of Law and Harris, architects and surveyors, Northampton.

A scheme for the main drainage of Borstal, which the Chatham Corporation have been compelled to undertake by order of the Local Government Board, to whom the medical authorities of H.M. Convict Prison, Borstal-hill, had appealed, resulting in a Government inquiry, is now being proceeded with, under the supervision of the sanitary engineers, Messrs. Taylor and Sons, and Santo Crimp. The consent of the Medway Conservancy Board and of the Admiralty to an outfall to the river of overflow water, after filtration, has been obtained.

The formal opening of Aberdare-hall, Cardiff, took place on Tuesday. Aberdare Hall was founded in 1885 in connection with the South Wales University at Cardiff, for the training of women students, and hitherto the work has been carried on in a temporary building. The new hall, two-thirds of which is completed, will form a square 88ft. in each direction. In the centre is the library, 30ft. square. The trustees of the late Mrs. Emily Pfeiffer have given about £2,000, over £2,000 has been raised by subscription, and the rest by mortgage of the buildings to the University College.

At Tuesday's meeting of the City Commission of Sewers, Mr. H. T. Gordon, F.R.I.B.A., presiding, £13,600 was voted towards an improvement in Whitecross-street, and it was resolved to acquire ground needed to widen the public way in Basinghall-street. A memorial from tradesmen in Bishopsgate-street Within was presented, urging the removal of certain shoring in front of premises in that street. It was stated that the "struts" had been up nearly two years. The clerk said the matter was entirely one for the district surveyor, whose duty it was to order the removal of the shorings, or "struts," when it was safe to do so. The matter was referred to the Streets Committee.

The managing committee of the British School at Athens offer to the University of Cambridge a studentship of £50, to be held at the school during the session 1895-6 by a duly qualified student nominated by the University. Students who desire to become candidates for the studentship must communicate their names to the Vice-Chancellor at Sidney Sussex College on or before Monday, October 28, together with such evidence as to their qualifications as they may desire to submit.

STATUES, MEMORIALS, &c.

Bristol.—The ground formed by the covering over of the water space above St. Augustine's Bridge, Bristol, which has been laid out as a pleasure ground from plans by Mr. Yabbicom, the city engineer, is about to be embellished with a statue of the philanthropist, Edward Colston. The statue is by Mr. John Cassidy, and cast in bronze—8ft. 3in. high—standing on a square pedestal of stone ornamented with bronze, also designed by Mr. Cassidy, 10ft. 4in. high. The four sides of the pedestal will carry bronze panels, two of them depicting scenes in the life of Colston, the third displaying an allegorical device, and the fourth bearing a short inscription.

◆

CHIPS.

Comparatively little business was done in estates at the Auction Mart, Tokenhouse-yard, last week, the total sales only amounting to £21,000.

The parish council of Gillingham, in Dorset, have decided to build a parish hall at a cost of £800. The architect is Mr. C. T. Miles, of Bournemouth. This is the first parish hall to be built under the new Act.

Mr. G. W. Willocks, a Local Government Board inspector, held an inquiry at Lancaster on Friday as to the application of the corporation to borrow £17,040 for the purpose of purchasing property and land to make a new street from Dallas-place to Carr House-lane, so as to provide direct communication north and south on the west side of the London and North-Western Company's line.

The new infectious hospital, Annan, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Bishop of Salisbury has just dedicated a side chapel at Wimborne Minster, which was formerly a chantry, founded nearly four hundred years ago by the Countess of Richmond, mother of Henry VII. It has now been restored, and will in future be used for daily service.

On Friday evening, at Baily's Castle Temperance Hotel, High-street, Launceston, the directors of the company owning the property entertained the architect of the newly erected hotel, Mr. Otho B. Peter, of Launceston, the contractor, Mr. E. Sharland, and his workmen at dinner.

The East Riding Antiquarian Society held their annual meeting at Filey on Thursday in last week. The great parish church, the earliest part of which dates from 1190, was described by Mr. J. R. Boyle, who pointed out that the sepulchral image of a boy bishop in the church was one of two known examples, the other figure being the one in Salisbury Cathedral.

The ceremony of laying the memorial stone of a new Free church at Kelty, N.B., was performed by the Earl of Moray, on Tuesday week. The church will be seated for 500, and the estimated cost is £2,200.

The Rev. Edward Maule Cole has been chosen President of the East Riding Antiquarian Society in the place of Dr. Cox, who has removed from the district.

Mr. Alexander Fraser, engineer to the Grand Junction Waterworks Company, died on Sunday at his residence, The Mount, Ealing, in his 73rd year.

New casual wards are about to be added to the workhouse at Sevenoaks, from plans by Mr. T. Potter, architect to the local board of guardians.

Col. A. G. Durnford, R.E., Inspector of the Local Government Board, held an inquiry on Friday in the Court House, Bishop's Lydeard, relative to an application by the Taunton Rural District Council for sanction to borrow £1,200 for the purpose of securing a water supply for the parish of Bishop's Lydeard.

At a meeting of master plumbers held on Monday afternoon at St. Peter's Institute, Buckingham Palace-road, it was decided to form a local branch of the National Association of Master Plumbers. Mr. Daniel T. Bostel, of 73, Ebury-street, S.W., was appointed hon. secretary.

The city council of Glasgow decided on Monday to purchase eight acres of land on the Kelvinside Estate for the extension of the Botanic Gardens, and with a view to the purification of the River Kelvin.

Sir W. H. Flower, the Director of the Natural History Department of the British Museum, has accepted an invitation to formally open the new museum at Perth towards the end of this month.

The newly-appointed trustees of the Thames and Severn Canal have appointed Mr. Edmund J. Cullis, Assoc.M.Inst.C.E. (now, and for some years past, assistant engineer to the Sharpuess Docks Company), as executive engineer to carry out the work of restoration.

Our Office Table.

It will be impracticable to proceed with the Strand to Holborn new thoroughfare scheme next session, for at the meeting of the London County Council the supporters of the project failed to obtain the necessary three-fourths majority for the suspension of the standing orders, so as to enable the proposal to be laid before Parliament next session. When a division was taken, there were 65 votes in favour of the proposal, and 35 against it; but a majority of three-fourths being required, the motion was practically lost, and a project involving an expenditure of more than two millions has thus been disposed of by a side issue, without any discussion of its merits. It will be remembered that the proposal of three years ago for a Council Broadway, conceived on nearly the same lines, except that then it was intended to form a terrace at the Strand end of the street, had to be withdrawn on account of the unsatisfactory character of the proposals for betterment.—At the same meeting of the County Council a long discussion took place on the proceedings of the Public Health and Housing Committee with reference to the Boundary-street scheme and the Millbank Prison site. On the last subject the committee recommended that Mr. Blashill, the Council's architect, be instructed to design the laying-out of the Millbank Prison site, and that the committee be authorised, if it should think fit, to engage the services of an outside architect or architects for such of the buildings as the Council shall determine to erect upon the site. Several members thought that the proposal suggested a slur on the architect's department, and it was moved that the recommendation should be referred back. The amendment was lost; but it was agreed to amend the recommendation so that the names of the architects would be merely submitted by the committee.

The Public Health and Housing Commiteee of the London County Council have prepared a scheme for the improvement of the area behind the north side of the Strand, adjoining Clare Market and the east side of Drury-lane. It has a total extent of 3½ acres, and in some parts the present population is upwards of 800 to the acre. The number of persons proposed to be displaced is 3,308, and provision can be made for rehousing about 1,770 of these, accommodation being furnished for 500 in the immediate vicinity, and for another 1,260 on the site of Millbank Prison. It is also proposed to widen Drury-lane on its eastern side to 40ft. so far as the property taken extends. The net cost of the property to be acquired under the scheme is £214,250, and the estimated cost of paving and other works is £2,250, representing a total net cost of £216,500. The area dealt with is described by the committee as the largest and worst of those crowded collections of courts and alleys which remain to disgrace Central London.

In a letter to the *Times* the Right Hon. Sir G. Osborne Morgan, M.P., one of three surviving members of the Select Committee of the House of Commons who decided in 1869 the famous "battle of the sites" for the Law Courts, states that the adoption of the Carey-street site would never have taken place had it not been that the members of the committee were authoritatively assured that the narrow part of the Strand would at once be widened into a handsome boulevard, such as the London County Council now proposed to drive from St. Mary-le-Strand to Clement Danes. "Beguiled by these representations," Sir George Morgan continues, "several members of the committee, including myself, voted for the Carey-street site, which was eventually approved by the narrow majority of two—a decision which, under the circumstances, I now greatly regret. Most certainly, but for this assurance, the Palace of Justice would have been placed on the Thames Embankment; for, as our chairman, the late Lord Derby (then Lord Stanley), was a strong advocate of that site, and would have given his casting vote in its favour, the transfer of a single voice would have sufficed to turn the scale. More than 26 years," he adds, "have now passed since the decision of the committee. Yet the condition of the Strand between the two churches remains exactly what it was in 1869, except that, with the opening of the Law Courts and the freeing of Waterloo Bridge, the traffic over it has probably more than doubled."

Edinburgh is seeking Parliamentary powers to follow the example of Liverpool, Manchester, Southampton, and other thriving municipalities, and absorb the surrounding suburbs within its rateable area. The Bill to be promoted next session by the Edinburgh Corporation for the amalgamation of the city with the boroughs of Leith and Portobello, provides for the inclusion within the new city boundaries of districts which will increase the present area of 9⅔ square miles to 21 square miles. The scheme will include not only the boroughs of Leigh and Portobello, but the annexation of considerable areas from a number of surrounding parishes, including Colinton, Liberton, and Duddingston. Eight wards will be added to the existing thirteen wards in the city; and the new corporation, which will comprise sixty-five members, will have transferred to it the powers of the water trust and the gas corporation, both of which it is proposed should be dissolved.

The City Council of Chester adopted on Wednesday an exhaustive report from Ransomes and Rapier, of Ipswich and Queen Victoria-street, E.C., on a project for erecting sluices on the Dee, near the Chester weir. It was decided, on the recommendation of a committee, to promote a Bill in the ensuing session, authorising the construction of sluices near the weir with the object (*a*) of preventing the tides from flowing over the weir; (*b*) of preventing the flooding of lands above the weir, and maintaining above the weir a uniform water level; and (*c*) improving the scour of the navigable channel below the weir, and conferring powers for prevention of the pollution of the river above the weir. Messrs. Ransome and Rapier in their report stated that while the quantity of tidal water passing the weir at Chester is too much for admixture with the drinking water, it is absolutely insignificant as regards any influence on the tidal portion of the river. They had retained the services of a skilled expert (Mr. Henry Law), who for the past twelve months had been engaged taking observations as to the rise and fall, &c., of the tide. Mr. Law calculated the average quantity of water which accumulated at high water, when the tide overtopped the land water at the weir, beyond what was in the upper river at low water, to be 17,500 cubic yards, and that fully half of land water. Mr. Law found that the tidal water passing Connah's Quay was 558,900,000 cubic yards, so that for scouring purposes the trifling quantity of tidal water that would be shut out by the sluices was of no real value. The best site for the sluices was about 150ft. above Chester Bridge. The bottom of the sluices would be 4ft. below, and the top of them 5ft. above, the present causeway, and that would suffice to keep out the highest tide. They estimated that the cost of the work, exclusive of Parliamentary expenses, would be £21,890.

The old Mansion House near the High Level Bridge at Newcastle-on-Tyne was totally destroyed by fire on Sunday night, the 41st anniversary of the great explosion and fire in the same district of the city. The Mansion House played for many years a conspicuous part in the civic and social life of Newcastle. At a period when many of the leading Novocastrian families resided in the neighbourhood of the Close, the Sandhill, Hanover-square, and Westgate-street, and when Newcastle was amongst the richest of the old corporations, for nearly two centuries bountiful hospitality was dispensed at the Mansion House in the Close, and, to assist him to do credit to the town in this respect, a salary of £2,000 a year was paid to the Mayor, and a noble house, handsomely furnished, with choice cellar of wine, was also provided. The Mansion House was built in 1691, and cost £6,000; but from time to time afterwards it was considerably enlarged. Besides this residence, there were provided for the use of the Mayors of Newcastle a handsome state coach, a barge, a valuable service of plate, &c. When the old Close Corporations, with their many abuses, were swept away by the Municipal Reform Act, the Newcastle Mansion House did not long survive. The official residence, with its costly furniture, pictures, books, plate, and wine, was sold by auction in January, 1837, and much of the old woodwork and carving had been removed. Of late years it has been used as an oil store and timber warehouse, and the inflammable nature of its contents rendered its destruction a matter of but three or four hours.

The introductory lecture to the classes in Architecture at University College, Gower-street, W., was delivered last (Thursday) evening by Professor T. Roger Smith, F.R.I.B.A., who took as his subject "Masterpieces of Masonry." The address was illustrated with lantern views, photographs, and diagrams. Professor Roger Smith's course of lectures at the College on "Architecture as a Fine Art" will commence on Tuesday evening next at six o'clock, and his course of lectures on Construction will be inaugurated on the following evening at the same hour. These courses will be continued throughout the session weekly. They are adapted to students of architecture and architects' pupils, and to those preparing for the Institute examinations, including that for district surveyors. The evening classes, at moderate fees, established by the Carpenters' Company, for Architectural Drawing and Building Construction Drawing, were resumed on Tuesday last, and the class for Measuring and Estimating on the previous Thursday. These classes are intended for architectural pupils and assistants in offices, decorators, builders, and skilled artisans.

At King's College, Strand, on Friday evening, Mr. Edward Smith, the Master of the Worshipful Company of Carpenters, presented the prizes awarded by the company, in conjunction with the council of King's College, to the students of the architecture and building construction classes, the architectural studio, and the woodcarving classes at King's College, Great Titchfield-street, and Kensington. The awards in the college classes were:—Day classes.—First year prize, silver medal and £4 to W. A. Buyers; second year, silver medal and £4, to S. Woodfield; third year, the Arthur Cates' medal, to P. J. E. Pym, to be given when the Royal Society of British Architects' examination is passed. Evening classes.—Architecture and Building Construction: Silver medal and £4, to H. Byron. Mr. Alderman Faudel Phillips's medal for Sanitary Science, to T. A. Creaton. Quantity Class: First prize, H. H. Young. Architectural Studio: Silver medal to H. I. Triggs. Constructional Drawing: First prize, H. Byron. Wood Carving.—Day Classes: Silver medal, L. W. Clarkson; one year's scholarship to W. T. Osborn, and one term scholarships to Miss Julia Carpenter, W. Curtis, Miss A. J. B. Clark, and Miss H. Lawrence. Evening classes: First prize (two years' scholarship and silver medal) to Wm. Forth; one year's scholarship and prize medal to W. Y. Smith; and one term scholarship to J. Dunn. Kensington Branch of Lady Students: First prize to Mrs. Atkinson, and second prize to Miss E. Leadbitter. We give a report of the proceedings in another column.

At the Glasgow Dean of Guild Court on Friday, Lord Dean of Guild Brown gave some interesting statistics in reference to the abnormal activity in the building trade in the city for the year ended 31st August last. He stated that the number of linings granted during that period had been 23 more than in the previous year, and the largest for 20 years; whilst the total value of the buildings authorised was £1,467,235, being £191,700 more than for the preceding year, and the largest for 18 years. There was a marked decrease in the number of linings granted for dwelling-houses of three and four apartments; but the falling off in these was more than made up by the extra number granted for houses of one, two, five, and six apartments and upwards. Although the number of linings for public buildings had not greatly increased, being eight as compared with six, the size and design of these had been of an exceptionally large and ornate character, their estimated value being £256,500, as compared with £27,000 in the preceding year. There had been 36 linings granted for new streets, extending 7,257 lineal yards, or four and one-eighth miles.

Just twelve months since representations were made by the London County Council to the various Metropolitan water companies as to the advisability, amongst other matters, of so altering their regulations under the Metropolis Water Acts, 1871, as to increase the maximum capacity of domestic and other flushing cisterns from two to three gallons. In view of the refusal of the companies to make the suggested alteration, as well as their failure to alter the regulations in the other points indicated, the Council decided to ask the Local Government Board to appoint a person of engineering knowledge and experience to report to them on the subject, as provided for in the Act. The Board has now appointed Colonel Ducat, R.E., to hold an inquiry, which has been fixed to take place on Thursday, the 31st inst. The solicitor to the Council has been instructed to appear to conduct the case for the Council, and the engineer, architect, and medical officer have been requested to place any information in their possession at his disposal, and, if required, to give evidence at the inquiry.

The plans for the new chimney shaft for the Edinburgh gasworks, as finally approved by the Dean of Guild Court of that city, show a stalk 250ft. in height, a reduction of 80ft. as compared with the well-known landmark in the Edinburgh valley about to be demolished. It was at first thought that a chimney 160ft. in height would be sufficient, then this was raised to 200ft., and eventually another 50ft. was found to be absolutely necessary. Mr. Mitchell, the chief engineer to the Gas Commissioners, stated that it will be square in outline, and constructed of brickwork, with projections, belts, and panels executed in bricks of a different hue. As was to be expected, the Guild Court was assured that "the materials and workmanship will be of an equally first-class character."

Mr. F. C. Penrose, F.R S., F.R I.B.A., will visit the Carpenters' Company Trades Training School, Great Titchfield-street, W., early in November, to give an address to the students. The classes at this school, which was established ten years ago, include almost all trades connected with building, such as classes for masons, tylers and bricklayers, carpenters and joiners, plasterers, plumbers, painters and decorators, wood carvers, and wheelwrights. The school was reopened in the second week in September with about 130 students.

The Education Department have notified the various school boards throughout the country that they are about to make several changes in their practice as regards the term of years over which the repayment of loans may be spread, all tending to reduce the term for paying back the sums borrowed. "(i.) They will not in ordinary cases recommend a term of repayment exceeding 35 years for new buildings, or for enlargements on so great a scale as to be properly classed with new buildings. (ii.) They will not in ordinary cases recommend a term exceeding 30 years for enlargements of less extent or for considerable structural improvements. (iii.) They will, in ordinary cases, recommend a shorter term than 30 years, to be settled on the report of their architect, for inconsiderable improvements or other works of a less permanent character; in particular they will not recommend a term of repayment extending beyond the time at which the improvement will probably be exhausted. (iv.) Where the loan is required partly for new buildings or enlargements and partly for minor improvements, such a term of repayment will be recommended as appears fair and reasonable, having regard to the proportion borne by the cost of the new buildings to that of the improvements."

The *Church Times* gives a detailed report of the benediction service held last week at the reopening of the extensive stone quarries on the property of the Hon. Mrs. P. Greville-Nugent in Dumfriesshire. The office used, as sanctioned by the Bishop of Glasgow and Galloway, included portions of the Litany, the processional hymn, "Christ is Made the Sure Foundation," the collect for the Feast of SS. Simon and Jude, and special prayers. The Very Rev. T. J. Ball, Provost of the Cathedral of the Isles, Cumbrae, who was vested in a handsome cope of cloth-of-gold, was the officiant, assisted by the Rev. T. O. Sturkey, Rector of Kirkandrews, Carlisle, and the Rev. F. Coleby, of St. John's, Annan. A marquee was fitted up on high ground overlooking the quarry, as a temporary chapel, in which the first part of the service took place, after which a procession was formed, headed by by cross-bearer and thurifer in scarlet cassock and alb; and having descended into the quarry itself, the officiating priest again recited the selected collects, and sprinkled the place with holy water. The processional was *Angulare fundamentum*, sung by the choir to its ancient *Urbs Beata* melody. At the conclusion of the ceremony, the locomotive engine, steam-digger, and steam cranes were set in motion, and after a brief inspection of the works, the clergy and guests returned to the mansion-house, where they were entertained by the Hon. Patrick and Mrs. Greville-Nugent.

The Alexandria Municipal Museum, erected for the preservation of antiquities belonging to the Greek, Roman, and Early Coptic periods, was inaugurated by the Khedive on September 26th, and is now open to the public. The collection of objects has been arranged by the curator, Dr. Botti. It has lately been enriched by valuable donations of jewels and gold ornaments from the collection of the late Sir John Antoniadis, and of coins from Mr. Glymenopoulo, and the Director-General of the Antiquities Department has promised to fill up all disposable space with contributions of Greek and Roman relics now lying in the Ghizeh Museum at Cairo. The present building, specially constructed, is all on one floor. It covers an area of about 960 square yards, and is planned with a view to enlargement when necessary. The municipality and the Alexandria Archæological Society are making excavations in the city and neighbourhood, hoping to discover the exact site of some one of the famous monuments of antiquity, and so throw light upon the topography of the ancient city; but hitherto their researches have proved only negative.

It is rumoured, says the *Royal Cornwall Gazette*, that Mr. Silvanus Trevail, the mayor of Truro, has expressed a strong wish to be relieved of municipal duties with the termination of his mayoralty in November next, chiefly on the ground that he has had no real holiday since the last Paris Exhibition in 1889. Mr. Trevail is a man of unbounded capacity for public work, and the city can ill afford to lose his services. No mayor of the city has been more conscientious and painstaking in discharging the multitudinous duties that fall to the lot of the chief magistrate than Mr. Trevail has during his year of office now drawing to a close. He has attended every meeting of the city council, and has rarely missed a meeting of the city magistrates. When absent it has been accounted for by some county council committee meeting or mayoral function clashing. Socially, Mr. Trevail has always been accessible to poor as well as rich, and whether it has been the inauguration of a distress fund in a hard winter, the occupancy of the chair at a public gathering, or the organisation of the ceremonial of a reception, or a procession such as that on Sunday week, the mayor has been equally at home, and up to time, doing his part in a manner that not even his enemies (and he has some bitter ones) could cavil at. In other words, the mayoralty of 1884-95, now drawing to a close, has been a distinct success.

A ratner safe has just preserved its contents in a fire lasting 44 hours. Before the Commissioner of Police of Smyrna, Mr. Fassoula Essad Effendi, accompanied by Messrs. André Caraman, M. Pangallos, Paul Manusso, Léon Lurot, Frederic Murat, John Spiegelthal, Henry Denotovich, and Dominique P. Maïnetti, the safe was opened after the same had been taken out from the fire which took place in the premises of Messrs. Paul Nalpas and Co.'s Agency, situate in the Rue Franque, corner of the Rue des Roses. The safe remained 44 hours in a fire which was fed by oils, acids, and alcohols, and contained the sum of 800fr. in gold and bank-notes, and various shares belonging to Mr. Ernest Nalpas, and representing the sum of 500 Turkish pounds or thereabouts, which respective amounts were found in a perfect state of preservation. The only other safe in the fire was one made by a celebrated English maker, and the contents thereof were entirely destroyed.

The United Asbestos Company, Ltd., of Dock House, Billiter-street, London, have issued an illustrated catalogue, which furnishes a very comprehensive list of the many applications of this valuable material. The present company, which is an amalgamation of three concerns, are sole manufacturers of the goods they describe. One of the special features is their "Victor" metallic joints, which have borne the test for hydraulic work in use in the navy to a pressure of 2,500lb. They are used in battle-ships, torpedo boats, transports, and in merchant steamers, and have been found to resist the attacks of time, and to supersede the ordinary indiarubber joints, both as regards security and cost. The "Salamandar" joint is also a very excellent joint worth the attention of the engineer. It has two concentric rings made from the "Victor" asbestos metallic cloth; these are sustained by a copper ring of ⅂ section, the vertical web of which forms a partition between them, and prevents their displacement by steam or moisture. A double self-sustaining joint is thus made. These joints can be used for wet steam, water, and other connections, and are made in two forms.

* * *

The vestry of St. Columba's Episcopal Church, Crieff, have accepted an offer of a peal of eight bells for the tower of the church.

MEETINGS FOR THE ENSUING WEEK.

Saturday (To-morrow).—Glasgow Architectural Association. Opening of new rooms, 187, Pitt-street, Glasgow. 3 p.m.

* * *

CHIPS.

The Dean and Chapter of Winchester have appointed Mr. J. B. Colson, F.R.I.B.A., to the post of architectural surveyor of the cathedral and other buildings belonging to the Chapter. Mr. Colson has for some years past discharged the duties of this most responsible office as deputy for his father, the late Mr. John Colson, to the satisfaction of the Chapter.

The town council of Eccles have memorialised the Local Government Board for sanction to borrow £3,250 for an extension of the town hall, which was erected in 1881. The extension consists of the provision of a new council-chamber, a police-court, and additional offices and ante-rooms. The plans have been prepared by Mr. A. C. Turley, borough surveyor and engineer.

The new Wesleyan chapel and Sunday-school erected at Lund Park, Keighley, were opened on Tuesday. The new structures take the place of a school-chapel at Heber-street, and have cost, including site and furnishing, £4,500. The architects are Messrs. W. and J. B. Bailey, of Keighley, and the chapel will accommodate 570 persons and the school 550.

The untimely death of Mr. Frederick William Bennett, the eldest son of Mr. Frederick Bennett, builder and contractor, of New-street Works, Ipswich, occurred on Saturday evening, after a fortnight's illness from typhoid fever. The deceased, who was in his twenty-fifth year, married less than twelve months ago, and leaves a widow and infant son. The late Mr. Bennett had been associated with his father in his extensive business since leaving school.

Ald. William Huntington, timber merchant and builder, Lancaster, has acceded to the unanimous wish of the town council, that he should accept the office of Mayor for the ensuing year. Ald. Huntington has taken deep interest in the town's supply, which has become the greatest profit-producing investment the Corporation has taken in hand. Under his chairmanship powers have been obtained within the past few weeks for the construction of a new reservoir, to cost £60,000.

At a meeting of the Bath City Council on Tuesday, the Mayor announced the gift of Henrietta Park to the city from Captain Forester, who inherited the Bathwick Estates from the late Duke of Cleveland. The park, which was formerly a private one, belonging to the estate, is situated in the centre of the city, and will probably be laid out by the council as a public pleasure-ground.

Estate duty has been paid on £96,630, as the value of the personal estate of Mr. John Hughes, of Sefton Park, solicitor, ex-Mayor of Liverpool. Mr. Hughes bequeaths his two oil paintings by Verbockhoven and one painting by Vollmar to the Corporation of Liverpool for their Permanent Collection of Pictures.

Yesterday week the Bishop of Oxford dedicated the south-east chapel of Wantage parish church, which has been restored under the direction of Messrs. Bodley and Garner, as a memorial to the late Dean Butler, of Lincoln, who was vicar of the parish for thirty-four years. Built in the 15th century, the chapel had become very dilapidated, but has now had a new floor and roof, and new stones substituted for those which were decayed. The east window, with stained glass representing the Crucifixion, has been given by the late dean's family, and an oak screen is placed at the west end.

The parish church of All Saints', King's Langley, which contains amongst other monuments the tomb of Edmund of Langley, first Duke of York, was reopened on Saturday after alterations, which have been completed at a cost of £900, under the direction of Messrs. Gordon Hills and Son. The organ has been removed from underneath the tower to the east end, and recased in oak, besides other additions to the instrument. The tower has been paved and seated, a new panel ceiling formed, and the western doorway restored. A brass eagle lectern has replaced the old reading-desk, and the chancel has been refurnished with oak choir and clergy stalls. A choir vestry has also been built.

No claim for compensation for property compulsorily acquired by a railway company exceeding in magnitude the claim of the Eyre Trustees for land on the St. John's Wood estate, scheduled by the Manchester, Sheffield, and Lincolnshire Railway, has been brought forward in recent years. The arbitration, over which Lord Balfour of Burleigh will preside, begins next week in the hall of the Surveyors' Institution, and will take at least a fortnight to complete. There is said to be a difference of £200,000 between what the railway company is prepared to hand over as compensation and the amount the trustees are willing to accept.

Trade News.

WAGES MOVEMENTS.

Swansea.—The carpenters and joiners of Swansea, who have been on strike for fourteen weeks for an advance of a halfpenny per hour and a rearrangement of the working hours, agreed, on Monday, to resume work at the old rate of wages. At a meeting, however, on the following evening of the Swansea master builders and the committee of carpenters and joiners, after settling the principal questions in dispute, they failed to agree on minor difficulties connected with the strike. Accordingly, the whole of the negotations collapsed, and the struggle continues. A number of men, however, differ from the policy of their committee, and returned to work on the old terms.

CHIPS.

An exhibition of the arts and crafts is to be held at the Drill Hall, Southampton, this winter.

Mr. Thomas Codington, M.Inst.C.E., engineering inspector of the Local Government Board, has been appointed deputy chief engineering inspector of the board in succession to Mr. Arnold Taylor.

An interesting ceremony took place at Huntington, near York, on Thursday in last week, when a memorial window in All Saints' Church, dedicated to the Rev. J. R. Morton, M.A., was unveiled. It is one of three in the north aisle, the other two already being filled with stained glass. In the upper part is the figure of the evangelist St. Mark, whilst below is a scene descriptive of the rebuilding of the temple. The work is by Messrs. Hardman and Sons, Birmingham.

Mr. F. H. Tulloch, Local Government Board inspector, held an inquiry on Friday into the application of the Moss Side Urban District Council for sanction to borrow £4,000 in respect of public street improvements. The council propose to repave the whole of Great Western-street with granite cubes instead of the soft setts at present forming the surface of the roadway, which had become worn out.

The foundation-stone of the Rational Association's new offices in Bridge-street, Manchester, will be laid on Tuesday next. The contract for the buildings amounts to £11,590.

The Hayfield Parish Council have approved of a settlement of the dispute as to the right of way from Hayfield over Kinder Scout, recommended by the Peak District Footpaths Preservation Society. A deputation from this society attended the meeting and advised the parish council to accept a new road to which the landowners are ready to agree in place of the old disputed way from Hayfield to Mill Hill.

The Finance Committee of the Liverpool City Council have instructed the town clerk to retain the services of an eminent engineer in London to report upon the establishment in Liverpool of a system of gas supply independent of that controlled by the Liverpool United Gaslight Company.

The Fulham Vestry have adopted plans by Mr. Charles Botterill, the surveyor, for the construction of steps from Putney Bridge to Pryer's Bank, at an estimated cost of £1,350.

At Crediton Town Hall, Colonel Durnford, R.E., held an inquiry on Tuesday week relative to the application of the district council for sanction to borrow £3,000 for the repair of footpaths and carrying out a drainage scheme at Fordton.

At a meeting of the Maesteg School Board, Glamorganshire, held on the 2nd inst., Mr. E. W. Burnett, of Tondû, near Bridgend, the architect to the board, was instructed to prepare plans, &c., for central schools, to accommodate 1,000 children.

The Evesham Rural District Council has instructed Mr. J. E. Willcox, C.E., of Birmingham, to at once obtain tenders for all works in connection with the scheme for villages' water-supply, which embraces some 35 miles of mains, and the construction of four service reservoirs, and also to proceed with the water-supply to Aldington, and extensions at Hampton. Mr. Willcox has also been instructed by the council to submit a scheme for the sewerage of Great and Little Hampton.

A Local Government inquiry was held on Wednesday last by Major-General Crozier, R.E., with respect to an application by the Castle Bromwich Rural District Council for the sanction of a loan of £2,000 for works of sewerage at Water Orton. The scheme was explained by the engineer, Mr. J. E. Willcox, C.E., of Birmingham. The sewage will be delivered on to the Birmingham Sewage Farm by arrangement with the Birmingham Tame and Rea Drainage Board. After the inquiry General Crozier made an inspection of the district.

Mr. Arthur Thomas Allom, architect, died suddenly on Thursday in last week at his residence, 2, Barnes Villas, Lonsdale-road, Barnes, aged sixty-six years.

On Friday, at Newton-on-the Hill, near Shrewsbury, memorial stones were laid on Sept. 27 of a new Calvinistic chapel, now in course of erection. The chapel, which will be built in a free treatment of the Elizabethan style, will cost about £500, and accommodation will be provided for 150 worshippers. The architects are Messrs. A. B. and W. Scott Deakin, of Shrewsbury, and the contractor is Mr. Thos. Morris, of Shrewsbury.

While workmen were engaged on Friday in making excavations for roads in connection with a new cemetery now being formed at Comely Bank, Edinburgh, they came upon an old Caledonian cist measuring from 3ft. to 4ft. in length, the sides and covering being of rough, coarse stone. No human remains were visible.

The vestry of Hammersmith have accepted the tender of Messrs. Wimpey and Co., a local firm of builders, at £24,246, for the building of the new town hall. The architect is Mr. J. H. Richardson, M.S.A., of Uxbridge-road, Shepherd's Bush.

The account of Mr. R. W. Hedley, the expert valuer of the dock property in connection with the Cardiff Harbour Trust scheme, was the subject of discussion at a special meeting on Friday of the Cardiff Harbour Trust Committee. The account was for 1,200 guineas, but it was contended that it should only have been for half that sum. After considerable discussion, the matter was referred to the town clerk, who was requested to look up all the correspondence and report.

Major Marindin, the Government Inspector, went over the extension of the London and South-Western Railway from Wadebridge to Bodmin on Friday. He was accompanied by Mr. G. F. Vallance, the divisional superintendent; Mr. B. Fisher, the divisional engineer; and Mr. Relf, the contractor. The inspector expressed himself satisfied, and has reported accordingly.

Mr. T. W. Powell, of Picard's Rough, Guildford, has undertaken to provide a site and erect a gymnasium at Abertillery, Mon., for the use of the men employed at his colleries, and Mr. F. R. Bates, of Newport, has received instructions to prepare plans for the building forthwith.

A daring innovation is, says a correspondent, being made in connection with the art classes at the new polytechnic at Chelsea, which opens its doors this week. South Kensington, with its systems, examinations, and grants, is to be ignored, and the art master, Mr. C. L. Burns, a pupil under Professor Herkomer at Bushey, is to work on his own principles. It is hoped that allowances from the Technical Education Board and other sources will cover the sacrifice of the South Kensington grants.

New board schools are about to be built at King's Houghton, Bucks, from plans by Mr. J. Hall Gibbons, of Birmingham, selected in competition.

The principle of supplying cold storage for the port of Hull has been unanimously adopted by the Hull Corporation. It is proposed to erect buildings for the storage of 40,000 sheep, or their equivalent in other articles; chill-rooms for 150 carcases of beef; and cattle lairs for 300 beasts. The expenditure is estimated to amount to £40,000 or £50,000.

Messrs. Measures Bros., Limited's, latest book of sections, &c., has been thoroughly revised up to date, and considerable matter has been added. This book, being so handy in pocket size, should prove of valuable assistance to everybody connected with the building trade, and considering the amount of practical and useful information, tables, &c., it should also be found very serviceable to the engineering world.

Mr. R. W. Fraser, of the Surveyors' Department, Egremont, Cheshire, has been appointed chief assistant in the borough engineer's department, Wolverhampton. There were a number of applicants for the post, out of which seven gentlemen were selected to appear before the committee, and Mr. Fraser was finally appointed.

On his retirement from the theatres branch of the L.C.C., Mr. Ernest A. E. Woodrow, A.R.I.B.A., has entered into partnership with Mr. Edwin O. Sachs, architect, of 11, Waterloo-place, Pall Mall.

Under the new articles of incorporation the hon. sec. of the Royal Architectural Museum is required to be elected annually. On Friday last at a meeting of the council, Mr. Maurice B. Adams was re-elected by acclamation on a proposal from the chair, seconded by Dr. Garnett, of the London County Council.

St. Mathias Church, Plymouth, has lately been enriched by the addition of a handsome altar frontal. It is made of green figured silk, and the design consists of a centre cross of gold, four blue plush and silk stoles with embroidered texts, and two pomegranates in the panels. The super-frontal is of similar material in red, with the words "Sanctus, Sanctus, Sanctus," worked in gold. The producer was Mr. Alfred Stalman, of Soho, London, the design being from the pencil of Mr. Geo. H. Fellowes-Prynne, F.R.I.B.A.

LAVERS and WESTLAKE.
PAINTED GLASS WINDOWS.
MONUMENTAL BRASSES.
MURAL DECORATION.
ENDELL STREET, BLOOMSBURY, LONDON, W.C.

W. H. LASCELLES and Co.,
121, Bunhill Row, London, E.C.
TELEPHONE No. 270.
HIGH-CLASS JOINERY.
LASCELLES' CONCRETE.
Conservatories & Greenhouses.
WOODEN BUILDINGS.
BANK, OFFICE, & SHOP FITTINGS.
CHURCH BENCHES & PULPITS.
ESTIMATES GIVEN ON APPLICATION.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful Colour of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Abertillery.—For chapel and school, for trustees of the Primitive Methodist Chapel, Sixbells, near Abertillery. Mr. D. J. Michael, Abertillery, accepted:—

Morgan, W., Sixbells	£794	0	0
Richards, A., Newbridge	750	0	0
Howe, H. W., Abertillery*	700	0	0

* Accepted.

Bayswater.—For erecting ten shops and fifteen residences in flats at Chepstow-place, Bayswater, S.W. Mr. E. J. Stubbs, architect:—

Williams, H. J.	£31,250	0	0
Boyce	30,890	0	0
Lawrence, E., and Sons	30,450	0	0
Perry and Co.	28,989	0	0
Allen	28,665	0	0

Bermondsey.—For reinstating premises after fire in Upper Russell-street. Messrs. Barnes-Williams, Ford, and Griffin, St. Thomas's Chambers, London Bridge, S.E., architects:—

Castle, W. and H.	£889	0	0
Wells, B.	778	0	0
Chalkley, J. C. (accepted)	761	0	0

Brent.—For constructing works of water supply at Brent, for the Totnes Rural Sanitary Authority:—
Veale Bros. (accepted).

Bethnal Green.—For reconstructing the heating apparatus at the school in Wolverley-street, Bethnal Green, which provides accommodation for 1,172 children, for the London School Board:—

Wontner-Smith, J., Gray, and Co.	£565	0	0
Pearson, R. H. and J., Ltd.	530	0	0
Maguire and Son	529	12	0
Russell and Co.	513	0	0
Comyn, Ching, and Co.	475	0	0
Wenham and Waters, Ltd.	430	0	0
May, J. and F.	410	0	0
Cannon, W. G., and Sons, London-road, S.E. (accepted)	398	10	0

Cheltenham.—For the construction of additional filter beds and a storage tank at Dowdeswell reservoir, for the town council:—

Collins and Godfrey (accepted)	£2,744	10	0

Crewe.—For fitting up heating apparatus at the mortuary chapel, for the town council:—

Langford, J., and Co. (accepted)	£34	10	0

Eccles.—For carrying out a scheme of electric lighting as prepared by Mr. S. V. Clirehugh, for the corporation:—

Manchester Edison-Swan Co., Ltd. (Accepted.)	£18,761	0	0

[Electrical engineer's estimate, £18,971.]

Edinburgh.—For the construction of a dome at the Calton Hill Observatory, for the reception of the large telescope and apparatus belonging to the city:—

Builders' work:—			
Brownlie, R., Colinton (accepted)	£1,095	0	0
Astronomical fittings:—			
Grubb, Sir H., Dublin (accepted)	1,095	0	0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2128.

FRIDAY, OCTOBER 18, 1895.

ANOTHER CATHEDRAL COMPETITION.

IT is a committee at Belfast, this time, who have in hand the project for a new cathedral. We hope they may bring it to a successful issue, and put to shame the failures or the delays of Liverpool, Manchester, and Birmingham. In this matter of modern cathedral building, Ireland and Scotland have had the start of England. Cork was far advanced, and Edinburgh was in progress, before Truro Cathedral was begun. It is noticeable that all three are of modest dimensions. The vast schemes which architects have always been tempted to invent did not get completed, even in the Middle Ages. Now they do not even get started. France, as every architect knows, is full of noble attempts, never to be realised. Italy is the same. Look at Laon, with its seven beginnings of towers, not one ever perfected. Look at Florence, with its exterior left half undone, and doomed, like Cologne, to be finished off in a perfunctory way by a mechanical race. We have never aimed at anything so vast, and, therefore, we have generally come nearer to accomplishing it. At Belfast, they talk of a modest £100,000, to be expended by degrees, which is a great deal more promising than if they spoke of half-a-million, and meant to defer building till nearly all of it was subscribed.

The competition, it is said, will proceed on a new and interesting principle. Six architects, selected by the assessor (who is himself to be nominated by the President of the Institute), will be invited to compete. Each of them is to be paid a fee of £50. Outsiders will also be at liberty to submit designs, and as regards their chance of obtaining the two further premiums which are offered, will be in the same position as the invited half-dozen. We presume they will also be treated in the same way as regards the real prize to be won, which is, of course, the being appointed architect of the building itself. Committees frequently fail to realise that it is for this, and not for a premium—which often would not pay the out-of-pocket expenses of preparing the premiated design—that architects really compete. So much, however, the assessor may here be trusted to explain to them. How, then, is this composite system—a limited competition supplemented by an open one—likely to work? It is an experiment well worth trying. Church design has fallen too much into the hands of a small group of men—some of them very able, but some, also, more remarkable for the multitude of opportunities which family or other influence brings them, than for the success with which those opportunities are used. They have their groove, and they keep in it. "Content to dwell in decencies for ever," they do nothing worth notice, either good or bad. It is really time that they gave others a chance, and if the Belfast committee can only free themselves from these Tite Barnacles of the profession, they will set a good example to church committees elsewhere.

It is not to be expected that the Tite Barnacles will like it. If some of them decline to be amongst the elect six, it will be only natural, and "nobody will be one penny the worse." But it is probable also that the terms which have been named—the very small sum of £50 for working expenses—will fail to tempt the real church architects of high reputation. In that case three courses suggest themselves. One is to increase the allowance to the invited competitors, still keeping the same number. Another is to reduce their number, and to divide the sum set apart for expenses amongst three, perhaps, instead of six. And, as a final alternative, capable men might be invited who have not had opportunities for gaining what is called a high reputation. An architect's reputation, more than that of any other artist, depends on what in common parlance goes by the name of chance. He may have studied church building from youth to age, he may have a mind stored with precedents, or an imagination overflowing with beautiful ideas; and yet, for want of opportunity, all his knowledge and all his invention may be hidden away in the dark. The author can start, as Burns says, with "three goose feathers and a whittle"; the painter can make some sort of show with a few shillings' worth of colours and canvas; but the architect must stick fast for ever unless somebody backs him up by laying out certain hundreds or thousands of pounds. Clever men often stick fast so for life. Blockheads, by scores, pass them in the race, because the blockheads, conscious of what they are, have caught at every means, except the legitimate one, of helping themselves on. They have married for money or for influence; they have considered what party it would pay best to join, and have sold themselves, body and soul, to that party, right or wrong; they have toadied here, and bullied there, and have submitted to being kicked "till they know whether, A shoe be Spanish or neat's leather," and at last they get their reward. The very people who use them, despise them; but they pay them their price, and the price, when they are architects, comes in commissions which should have gone to honester and abler men. There are many such able men, deserving and neglected, and a competition like this might give one or two at least of them the chance of fame, if not of fortune, which never came to them before, and may never come again. The inner ring of church architects have had things too much their own way; it is time that outsiders were permitted to show whether they are outside by desert or only by accident.

The Belfast committee seem to be avoiding one mistake by which so many competitions are injured—namely, the concealment of the assessor's name. A low kind of suspicion sometimes induces the promoters of a new building to withhold it till the last moment; they think, apparently, that an astute competitor can somehow get in league with the professional adjudicator, and that these two dishonest persons can then work the thing together and divide the spoil. It is their own fault if committees fix on a person capable of frauds like this, and we may be sure that Mr. Pemrose will take care to prevent any such danger in the choice he advises. Almost everything, as to the character of the design, will depend on who the assessor is. When we hear his name, we shall be able to judge pretty accurately whether the cathedral is intended to be Gothic, Classic, Romanesque, or Renaissance; and we shall be able to foresee, too, whether it is or is not to be planned on strictly Mediæval lines. Is it, or is it not, intended for something closely approaching to a Catholic ritual? Is it, on the other hand, to be suitable not only for worship, but for preaching? This is a question for the promoters—and a question which lies at the bottom of the whole scheme. It is not the business of an architectural journal to advocate either the one type of church or the other; but it will be clearly the duty of the assessor, in drawing up the conditions, to say what the practical requirements are. The two cases require totally different treatment, and it is both foolish and unfair to let competitors grope in the dark, trusting that a happy accident will enable them to provide the sort of interior which the promoters have decided on. At the same time, every fresh competition teaches them more and more that statements of this nature should not be made into definite and rigid instructions. They should indicate the ideas of the committee as they are at the time when directions of architects are issued; but they should never be put forward as absolutely fixed and unalterable. Plenty of information, and at the same time plenty of freedom as to the extent to which this information is to be acted on, are the only conditions under which a contest like this is likely to turn out well.

Competitors at a distance, again, who know nothing of Belfast, ought, as far as possible, to be placed on an equality with local ones. That is, they should get a few lines of information about the materials in use there: the ordinary stones for walling and for ashlar, and other matters as to which special knowledge is valuable. And is it not time, too, at last, that assessors took another step, for want of which half the competitors commonly waste all their trouble, and the promoters fail to get anything like the number of practicable schemes they might have secured? Is it too much to expect an assessor to issue with the instructions—not only a plan of the site and its surroundings, which by itself may be utterly misleading, as it was in the case of the Sheffield Municipal Buildings—but also to send out some slight outline sketches showing the nature and height of neighbouring structures? When this is done, and not until it is done, one further step will be taken towards putting all competitors on a level; and it will then become more likely than it often is now, that the best man will win.

OPPORTUNITIES OF THE YOUNG ARCHITECT.

IN a short time the architectural societies will be again in working order. We have the inaugural addresses given or announced of some of these. Last week we published the address of the President of the Manchester Society of Architects, Mr. John Holden, F.R.I.B.A., whose position as a leading practitioner entitles his remarks to the attention of the profession, and this week it is the turn of Mr. W. D. Caröe, F.S.A., to inaugurate, as president, in like manner the session of the London Architectural Association. As usual of late years, a large part of the addresses delivered annually refer to the educational movement in the profession. The President of the Manchester Society, like others, has had to deplore the indifference shown by students to the facilities placed at their disposal. The classes, he says, arranged between the Society and the Technical School have not been so well attended as was expected, and the same neglect has been observed, as Mr. Caröe laments, amongst London students of the A. A. classes and studio work. The younger men will not respond; they hold back from all educational institutions. If they belong to a society, they seldom put in an appearance; and the Institute examinations, even when brought down to their very doors, receive scarcely any attention. Such is the case at least at Manchester, where a large number of architects' pupils and assistants dwell, and the same indifference and apathy exist in other large towns. Mr. Holden says the Institute examinations have been brought to Manchester many times at great trouble and expense; but very few of the Manchester students have taken advantage of them. During the earlier examinations held there, not one attended from Manchester, and out of fifty students in the last two examinations, only five were from that city, and only three passed—the remaining students being from small towns. How is this fact to be accounted for? Have we not here a proof that we cannot make young men studious, if they have not the inclination to avail themselves of the opportunities placed in their way? Or is the system wrong which sets before them a course of instruction which they do not think necessary? That there is a sad want of discipline amongst architectural students is too obvious to bear refutation. A young man who has a pretty fair knowledge of drawing and the routine of an architect's office believes he has no need of instruction in mathematics, science, English history, and literature and art. He thinks there is an easier way than attending classes and lectures in technical schools; successful men in his profession have won a name without. The President of the Manchester Society admits "the question of education is a serious one,—indeed, I confess I cannot understand it," and he goes on to invite communications from students on the subject which may explain the great lassitude and indifference which seems to exist. But the president appears hardly to realise the fact that the students who show this apathy and indifference are in many cases the very men who have confidence enough in their own abilities as not to require any instruction; many of them have artistic proclivities which they know cannot be fairly tested by an examination conducted on the lines laid down by the Institute; while, on the other hand, those who respond are frequently young aspirants for the profession who have little aptness for art, and who are anxious to learn architecture if it can be taught. There are, in fact, two classes of students: those who can rely on their own powers, and who are independent of educational aid; and those who are anxious to be *made* architects. The latter are always more numerous and tractable as students. This difference has yet to be learned by all who are disheartened at the disinclination of young men to join classes and studies. Some other inducement seems to be necessary to the former class to make them take an interest in education. Competitions in which their art power is evoked are more successful with this class of young men; a contest in which drawing, design, or colour decoration are concerned, will be sure to "draw," while a class lecture or examination on construction or mathematical analysis will meet with poor recognition. Will it not always be so? It is only human nature to expect that everybody will take an interest only in those subjects he knows best and shirk others, especially when there is no compulsory law. Then there is a regret expressed of a disinclination to study Classic architecture among students, and to revert to "more catching and sensational styles." Even in that stronghold of modernism, Classic has lost its hold upon the younger men, and has given place to the freer picturesque developments of the Renaissance, and students in Manchester, as elsewhere, have been losers from an educational point of view.

From a rather different standpoint, Mr. Chas. Hadfield, F.R.I.B.A., president of the Sheffield Society of Architects, in his opening address, reviewed the same aspects of the work of the student. While advocating a lofty ideal and a Vitruvian standard of attainments which were followed by the leaders of the Renaissance in Italy, France, and England, he yet drew an important distinction which it would be wise for the student to remember—namely, that it is not the nomenclature of styles the young architect has to study so much as the skill of appropriating what is good and essential in them, and of cultivating his designing faculties. Let the student take to heart the advice that "brilliant draughtsmanship and the passing of examinations are but a means to an end." Speaking of drawing, Mr. Hadfield said that he had doubt if any of the drawings of the great masters of the 16th, 17th, and 18th centuries would pass muster at a South Kensington Science and Art examination in freehand and building construction, although their authors immortalised themselves by their works in marble, stone, and brick. The aim of the modern student should be in studying and analysing building types, old and new, not in merely copying and measuring them. It is equally true that the educational system in vogue amongst us puts too much trust in a knowledge of historic styles, too little on the grammar upon which these were based. Mr. Hadfield observes with discriminating irony that we are too fond of proclaiming the shibboleths of style, of talking about our buildings being designed in "Free Classic," "Early Gothic," "Queen Anne," and what not, rather than of investing them with the charm and character that were inseparable from all these developments of which we talk so glibly. The fact is, our instruction, as we have often said, has been on the principle of learning the historic outcome instead of the methods used. Again, what has it to do with a man's ability as an architect whether he is a Classicist or a Gothicist? Nothing whatever; not a whit more than to say a painter is of this or that school when he really may be a duffer in painting. To the architect who has learned the alphabet of his art it matters nothing; he can just as well put together his materials in one style as in another, so long as he can make them his own, just as a skilled writer can embody in good English his meaning if he knows the vocabulary and grammar. It is the skill to put the thought in the best and happiest language that is the main thing—not to fuss about whether the words are derived from Latin or Anglo-Saxon. We are afraid that a good deal of the class-teaching in the styles of architecture is scarcely given in the right way, in directing the student to think for himself. The characteristics of the styles are useful to be learned as an exercise if they are accompanied or supplemented by the pupil putting his own inventive designing faculties to the test with his own materials and data. On the contrary, if this knowledge assumes the character of making drawings and details of a few historic edifices, and of filling up a few papers with terms and definitions, the teaching is of no value to the student, except to make him an imitator. The Science and Art Department sets before its students the design of cathedrals, town halls, palaces of legislature; but these exercises are only useful as competitions of draughtsmanship; they do not help him how to set about planning a building to accommodate so many people, to adapt the local materials of the district, and to impart character to buildings that have no historic precedent. These are problems that can be only solved by teaching how to plan on scientific data, and how to use materials to the best advantage. The advice given by Mr. Hadfield to the young architect or student how he can spend his hours of recreation in fields and woods in sketching, making the best use of his cycling powers in finding materials for sketching, in using his thinking faculties for original and artistic design; how by habits of system, hard work, punctuality, and self-culture he may be able to overcome the inertia of indolence, and rise to the opportunity or the occasion—is worth the attention of the rising generation of young men. Lastly, we have the admirable address of Mr. W. D. Caröe before the Architectural Association. His question, whether its course of study should acknowledge the Institute exams., and aid in preparing for them, or be independent of them, has yet to be answered by those concerned. But he entertains a hope that, before many years are out, "the most eager advocates of examination will have found that no form of diploma, no corollary of significant letters, will in any way advance the cause we have at heart; but that these degrees may prove something akin to a burden upon their bearers, and an imposition upon the public." As he truly says, "the examination is the safeguard of those only who look no further than an official guarantee of stereotyped efficiency." We must take the evil with the good, and make our education thorough and many-sided and bring our classes into line with the examinations as far as possible for those who wish to pass them. Everything the examinations can do—and they are not to be under-estimated—can do little if the student does not make an effort himself, and shake off his slothfulness and indifference; everything the classes and studio work can give will be unavailing, if he cannot, or will not, learn, or if his own efforts and aims are not in harmony with the profession he has adopted.

THE NEW GALLERY EXHIBITION.

LOVERS of portraiture will find the walls of this gallery covered with many examples of the modern art by exponents of opposite schools. The Society of Portrait Painters have brought together a varied and interesting collection, many of the painters having exhibited at the Salon of the Champs de Mars, and being espoused to Scotch Impressionism. Of these exponents of the Glasgow school, there are James Guthrie, John Lavery, MM. Duran, Gandara, and others, whose works are masterly and sympathetic. They study colour and arrangement, or technique; some affect the flat and shadowless style of Holbein; others, still, the highly-modelled and shaded portraits of the realistic school. We have, in fact, both the reproducers of models with faultless accuracy, and those who represent chiefly their own aims, colour harmonies, and idealities. The traditions of the British School of Reynolds are followed in the large full-length portraits of "The Countess of Yarborough" and "The Duchess of Portland" in the North Room, both painted by Ellis Roberts. They are queenly figures, standing in the conventional landscape, and have much grace and dignity; but the handling is rather mechanical. Very different is the flat, shadowless style seen in such works as those of Mouat Loudan in the West Room, or of M. Blanche and Prince Pierre Troubetzkoy. "The Hon. Mrs. Talbot" (2), by J. E. Blanche, is a characteristic sketch of this lady in large straw hat and blue scarf. His portrait (8) has an extremely washed-out appearance about a rather weak type of face, but it has a note of refinement in colour. Mouat Loudan's "Terence, son of Walter Philip" (3), is essentially flat in treatment, and contrasts very strongly with such a portrait as that near it of "Mrs. Lewis" (6), in which an elderly lady, seated, is portrayed with much minuteness and realistic detail. This is emulative of the Holbeinesque school. We can detect the down and texture of the skin, the kindly moist eyes, and the very grey hairs can be singled out. The painter is Frederick Sandys, the pre-Raphaelite. Again the large canvas of Prince Troubetzkoy (13), "Mrs. M. Grimshaw," is an important contribution to the same school of portraiture to which we have been alluding. The lady is reclining, and is admirably drawn, on a wickerwork chair against a flat, bare wall; there are no accessories, and the colours are a harmony of grey and drab; but there is no attempt at modelling; although this example is less objectionably advanced in its aims than some further on, in which the ideal of young Glasgow is pronounced. Arthur Melville's presentment of "Mrs. Greenlees" (5) is a clever harmony in brown, in which there is decided character expressed in the face. S. J. Solomon's study of a little girl dressed in white, holding a pet rabbit in her arms, is very truthful and tender. The face is of a true Italian type, dark hair, and sallow complexion. "Miss Cissie Loftus" (14), the well-known actress, in white tea-gown enriched with lace, and her hair hanging loose, is depicted in one of her best-known characters. Hon. John Collier has been successful in his personification and treatment. Arthur Hacker, A.R.A., in his portraits of two gentlemen (15 and 22), has expressed not only lineaments but character. Another portrait or standing figure of "Mr. G. W. Robinson" (18), by H. A. Olivier, is strongly naturalistic. That gentleman is portrayed in a front garden, gathering white roses in light tweed suit and straw hat. A harmony in black of a lady, entitled "Dreams" (19), in low black dress, standing before a piano, one hand on the keys, and her head turned up in a thoughtful mood, is by Ernest Oppler. The drawing is graceful. G. F. Watts, R.A., sends two portraits, both refined in composition and colour. The first model is "Mrs. Edward Ellice" (27), a charmingly refined face, and "Sympathy" (29) is a portrait study of a lady, in tones of brown and grey. In a central position in this room is a very dignified and dramatic presentment of "Madame Sara Bernhardt" (28), by Ant. Gandara, a full-length study, seen from behind, of the great French actress. It is full of grace and refined lines, the head and face turned a little, displaying the profile. She is attired in a rich robe of satin of a delicate peach shade. As a study of pose and drapery, the work is a highly-successful one of this eminent contributor to the Salon. The work of John Lavery (1 and 33), the first an attractive woman, and a young lady in black cape and dress, are studies of interest, and not going to the length of sacrificing portraiture to the artist's individuality, but the handling looks hard; and we must pass hurriedly by the Hon. John Collier's portrait of himself (40); the nice grey tone in S. G. Enderby's harmonious study of "Miss Kitty Jollie"—a very natural and broadly-painted portrait of a little girl in grey frock, and hoop in her hand; Mouat Loudan's group of children (43), in a low tone; G. Nicolet's very natural and child-like attitude of a young girl reading on a chair (49), and Julian Story's study of a lady, a loose cloak thrown over one shoulder, the other bare.

In the North Room several noticeable portraits are hung. Carolus Duran, of French fame, sends a rather ordinary type of portraiture in "Fritz Thaulow" (59); J. H. Bentley, a pretty face (58); Arthur Hacker, A.R.A., has a portrait of a young lady, sober and natural (69); and we must also notice a group of children's portraits in the centre of room. J. Hanson Walker has a pleasing child-study, "Dorothy, the Daughter of Viscount Hood" (67), and other studies of a similar kind by J. J. Shannon, Fred Yates, Jas. Guthrie, and others. Mrs. Lily Delissa Joseph's portrait of herself (75) is perhaps a facetious, certainly a grotesque, mode of representing character—a white, ghost-like lady carrying a pair of lighted candlesticks. The portraits of "Mrs. Kennedy," by herself (77), in a reclining position, in blue dress, and the standing portraits of "The Countess of Yarborough" and "The Duchess of Portland," already noticed, are works of meritorious realism. Against these we must set the impressionist portrait of a young lady by John Lavery, a harmony in white, grey, and black. T. Blake Wirgman has a capital portrait of Sir Henry Doulton, seated at a table reading, a beautiful Etruscan vase before him. Next, the Hon. John Collier's dramatic-looking, full-length, and superb study of Miss Julia Neilson, in rose-coloured garment, holding back a crimson curtain, we have seen before. The colour is overpowering. Very admirable refined studies of ladies are those of "Miss Maud Hobson," by F. Markham Skipworth, and "Mrs. W. Llewellyn," by herself. The former is in a fashionable costume, large black hat, and low-cut dress, set off on a yellowish ground; the latter in steel-coloured satin dress with large puff sleeves. Miss B. Gibbs's model (100) is in a bright canary yellow. The eager, stooping position of the lady rather spoils the work, which is cleverly lighted. Gustave Courtois's "A Portrait" is rather a statuesque study in profile. The influence of the fashionable toilette of ladies is marked in many of their portraits. The fair model is not always willing to be painted in classical dress, or æsthetic 18th-century gowns with high waists and clinging skirts, and hence the correctness of the latest tea-gown, the amplitude of the puff sleeves, the cut of blouse, and the size and style of hat and its loops of silk ribbon, are necessary studies of the portrait painter. T. Graham shows a pleasing scheme of maze colour in portrait (118), and Francis H. O'Connor (117) a sympathetic portrait of a lady, on a light background; the face is slightly turned. Miss Sophie Stern (112) paints herself "as in a looking-glass"—a pretty study of a light print dress with puff sleeves, dexterously handled in the reflection, and we have some other studies of pretty women and toilettes in Miss Ethel Wright's "Mrs. Hardy," in white; "Mrs. Benett" (121), by W. R. Symonds; "Mrs. Fergusson," by Hugh de T. Glazebrook. The portrait of the late Professor Huxley, by the Hon. John Collier, is an excellent likeness of the great physiologist, painted many years ago. George Clauson, A.R.A., has a characteristic portrait of Mr. Mark Fisher. One of the leading studies in the South Room is that of "Madame Severine" (146), by I. W. Hawkins, who in this presentment of the great Parisian writer, in full face, her arms resting on a table covered with papers and letters, shows clever technique, and decided French mannerism. Near it, W. W. Ouless, R.A., has an excellent portrait of "Mr. A. J. Aubertin." The massive, picturesque face in white beard is set off by a brown cloak and scarlet necktie. His other model is "Sir John Bridge," a good likeness of the worthy magistrate. E. A. Ward (150) has an idealised subject of a fair lady in a salmon-coloured dress, exhibiting charm of colour contrast; but we can only find space to mention other studies—some in pastel. P. Wilson Steer (155) has a vigorous sketch in strong pigments of a lady. Herman G. Herkomer sends a full-length figure study of Mr. H. Beerbohm Tree as "Gringoire" (136), in a centre-piece full of power and dramatic action, and Miss Octavia Peill a simple and attractive portrait of a lady (132). McNeill Whistler has a "Study in Red," a woman's head, strongly accented in his own vigorous style. Many of the portraits here have been seen in former exhibitions and at the Champs de Mars, as one or two of Mr. Guthrie's. Another Scotch impressionist, Mr. Lavery, sends a large number of ladies' portraits, all of them chiefly schemes of colour and arrangement, and only in a secondary sense portraits. One or two painters, like W. Schlobach, in the Balcony, have subordinated all other considerations to the scheme of colour, and to a sort of grotesque characterisation which astonishes, if it does not create admiration.

CLUNY MUSEUM.—V.

By May Morris.

IRONWORK.

WHILE wandering through the "iron-room" in the Cluny Museum, one's attention is arrested by endless tools, kitchen utensils, weights and measures, and all those odds and ends which help to build up for us that picture of the past about which we have so vivid a curiosity. There is one case here which is full of such things as box-irons (prettily ornamented, of course), fish-moulds, gridirons, gaufre-irons, wafer-moulds, and various kitchen contrivances which remind one that the Mediæval household pursued the "art of life" with considerable ingenuity and refinement. Anyone who has seen a Mediæval kitchen—there are some left with their old fittings, especially in France—with its great fireplaces, its hot-plates, ovens, &c., will understand the importance of this part of the Mediæval dwelling-house or castle, and the attention bestowed on it with all its appurtenances. To begin with, every well-built kitchen (often a building apart, and of great architectural beauty) was designed with careful provision for effective ventilation, so that our forefathers had, at any rate, opportunity for genuine roasting, a form of cookery, in its perfection, not understood by cooks who surround and choke their roasting viands with a thing called a meat-screen. With their fresh air, therefore, and their great open fires of fragrant wood for roasting and boiling, and a hot plate for made dishes, the Mediæval cook started better equipped for his work than might be supposed. Let me give an idea of the contrivances and conveniences as far as they went, necessary for the purveying of a dinner of the 14th-century house, it might be of a rich burgess or of a manorial lord. On the hearth was an iron tripod, which stood well surrounded by the flames, and held the big *pot-au-feu* which, to provide broth for a large household, was no trifle in size. Then the fire-dogs. which held the burning logs together, were not merely dogs, but had at the top a round rim contrived to serve as plate-warmer; on hooks up and down the tall columns were hung iron spoons and forks, pincers or tongs conveniently to hand for the cook's use, while across the front of the fire, attached to the dogs at each end, was the long turning-spit, sometimes two or three of them, which could be fixed at different levels to modify the heat on the cooking joints and birds. I have seen the same arrangement with a clockwork turn-spit in full going order in a little country inn in France, and it is to be seen, of course, in the big *rotisseries* in Paris. The following is a condensed list of the kitchen furniture that had to be laid in on the occasion of a wedding-feast in a Parisian burgess's family at the end of the 14th century. There were to be two squires of the kitchen with two helpers for the dresser where the victuals were prepared, and the one squire was to see to the purveying of the following: two great copper pots, two cauldrons, four colanders, a pestle and mortar, six thick kitchen cloths, three large earthenware wine-jars, a big *pot-au-feu,* four bowls, and four wooden spoons, an iron shovel, four shovels with handles, two trivets, and an iron spoon. Of tinware: 10doz. small bowls, 6doz. little dishes, 2½doz. big ones, eight quarts and 2doz. pints and two alms-pots. The alms-pots were an important institution: they were great vessels placed in the dining-hall as well as in the kitchen at all the great dinners, into which a portion of each dish was supposed to be placed, in reality the fragments of the feast collected for the poor. Those in the hall were often of silver and richly decorated like the rest of the equipment of the tables, and were as much a manifestation of pride and riches as of charity. To return to the wedding-feast, the arrangements for the hall were as follows: there were two squires to attend to the dresser in the hall where the dressed food was brought from the kitchens before being placed on the tables; they attended to the serving of wine also; two squires who delivered the wine to the dresser; two of the most honest and trustworthy to attend the bridegroom; two *maitres d'hôtel,* and for each table a taster and two servers. The *maitres d'hôtel* look after all the silver, the great salts and cups, &c. There was, of silver, 4doz. cups, four covered goblets gilded, six ewers, 4doz. silver spoons, four silver quarts, two alms-pots, and two spice or sweetmeat holders. Note that a garland-maker or flower-girl is ordered to deliver fresh wreaths on the day of the feast, with which the guests are garlanded. She will also, doubtless, provide flowers and herbs to mingle with the fresh rushes that are to cover the floor of the hall, though I doubt whether there will be much sweetness left upon the floor when the feast is over, and the guests have thrown about their fragments and bones. The women of the house are to make provision of tapestry and hangings, and to see that they are hung, and especially to see after the decking of the marriage chamber, and to see that the bridal bed is properly blessed beforehand.

This dinner is arranged "for 20 bowls or *escuelles,*" which means for 40 guests, as they dined in pairs, two sharing the same bowl. For plates, trenchers of common bread would be used, most likely thrown into the alms-basket when done with. Many are the directions in books of good manners for cleanliness and courtesy in eating at table—details that are positively blood-curdling to modern ears. One is glad to know, at any rate, that they always scrupulously washed their hands before and after meals, and sometimes in between the courses. And here, as we touch upon the subject of feasts, I would like to say that the notion that our early forefathers went through life gorging themselves at daily feasts is very unfair to them. As a rule they made simple meals, and got less eating into the day than we do. The meals one reads of were *feasts*, partaken of sometimes by hundreds of guests, coming and going, for whom constant and fresh supplies of food had to be provided. You know the old rhyme :—

"Lever à six,
Disner à dix,
Souper à six,
Coucher à dix."

Or the older one :—

"Lever à cinq,
Diner à neuf,
Souper à cinq,
Coucher à neuf,
Fait vivre d'ans nonante et neuf."

This was usually adhered to—two meals a day, with sometimes a "rere-supper" or fruit and wine in your room when retiring to bed. On ordinary occasions the food was plain and not much varied ; broths, boiled mutton, fresh and salt or smoked pork, game, while the cooks occasionally were allowed to let themselves loose in the conception of all sorts of weird and fanciful dishes. "Take pigs, flay them, and hew them in gobbet," is the favourite quotation of a friend of mine who is pleased to jeer at the cooking, that has gone with the other things mediæval, into the "ewigkeit" ; but it does not at all typify the state of the culinary art in the 14th century.

The kitchen ware in the illustration is all of the 15th-century. The object on the left is a mould to grill fish in, an ingenious "contraption," which would turn out your carp or your pike beautifully done on both sides, with a nice *barré* pattern all over it. The trivet or support for a saucepan and the round gridiron are, both of them, as practical as they are ornamental.

This room, filled with ironwork of every possible description, is crowded with interesting things. Marvellous keys—some dainty and flower-like, looking as if they had been made to open the way into fairy-land, others as ponderous and unwieldy as though they had been fashioned on a giant's forge ;—locks, arched and pillared, and covered with fine ornament, looking like the front of some Gothic cathedral in miniature ; strange weapons of offence and defence ; pots and pans and dishes, even workmen's tools and implements. One of the most beautiful and remarkable of these objects is a bronze tithe-pot or *dîme*, of the 13th-century (see illustration), one of the most perfect things of its kind and of its age that I have ever seen. It is supported on three feet formed of grotesque heads. The running ornament in the lowest division is characteristic of the purest 13th-century style. In the middle is represented a hawking party, a lady and gentleman on horseback, falcon in hand, while the top is wreathed by a beautiful border of girls dancing hand in hand—dancing in thanksgiving after the harvest. This vessel comes, no doubt, from some feudal castle, where it duly measured the over-lord's tithe of the gathered-in harvest. It bears no inscription, though such measures usually have their record round them. The museum possesses another, of the 15th century, which belonged to the Château de Milly. It is made of bell-metal, ornamented with flower-de-luces, and bears the legend "*Rogier de Amiens me fecit.* Liborgeois mô seigneur Guill. de Milli ount fete feire ceste mine bone et belle p. so gré." Fair and great the burgesses of Mille bade Roger of Amiens make the vessel for their lords' pleasure ; but did they bring their goods for measuring under the sharp eye of his steward with all the alacrity here expressed? The girls dance on, and the lords and ladies go hawking, but it is not always good harvest for the good men of Milly, yet the fair and great pot must be full just the same. "*Rodolphus vernonensis me copiâ fecit*" is the legend of another similar dîme. Then we have measures coming from the famous Abbey of Citeaux, bearing the arms of the Abbey, as well as the mark of Burgundy. One is rather curious —an *oil-pint* in bronze, which, bearing the date 1572, had been lengthened in 1686, and has the date of the modification marked on it. Some charming lamps, too, Gothic in style and contrivance, though of Late date, which I should have liked much to reproduce, as they give one a good idea of the ingenuity of the Mediæval mind. A lamp was wanted to be hooked on to a ring and quickly detachable, which should hang straight and evenly, and by means of joints they managed it, and a very good contrivance it is. One of the finest (they are oil-lamps, with a wick) has an Italian inscription round the bowl : "*Servo e me cosumo altri.*" "I burn for and serve others" is a clumsy translation of the prettily-worded device.

I must not pass without comment the large collection of wafer-moulds and moulds for altar-wafers, stretching over a long period, and from different parts of the country, and the plaster casts taken from others. There is an elaborate wafer-mould from the parish of Romilly-sur-Aigre (Eure-et-Loire dept.) of the 15th century. Christ on the Cross between Mary and St. John, the Descent from the Cross, on a flower-de-luce ground ; the Pascal lamb and the Monogram—all find place on it. A still more interesting mould of the 13th century has on one side God, with His right hand raised in Benediction, with the world in His left, with the legend "*Cuncta creata rego, trinus et unus ego.*" The border has little subjects from the life of Christ, with a legend round. The other face has Christ in the middle in a six-lobed aureole, with a border, in which are the Apostles in little Gothic niches. Another has on one side the arms of the Duke of Burgundy, and on the other the flower-de-luce of France. I saw several similar ones in the kitchen of the famous Hotel-Dieu at Beaune this summer. It gave great reality to all these Mediæval kitchen utensils, ewers, bowls, pots, fire-irons, and the like, to see them in their place in the old kitchen, which, with the rest of this interesting building, has been left with all its fittings almost untouched since the days of Philip of Burgundy, whose chancellor, out of his piety and good-will, founded the poor-house of Beaune.

Anyone interested in looking up the earlier objects of domestic art in the Cluny Museum should not fail to see the bowls and washing-basins, buckets, &c., of which there are several fine specimens. There is one washing-basin in copper, beaten and engraved, formed by the bust of a man, supported on three legs, a shield on his breast with the French flower-de-luce on it. Another curious bowl in bronze, on a foot, with cover, having on it a shield with an enamelled coat of arms. A charming pail or bucket, too, in bronze, with a handle of pierced ornament, of Italian Gothic workmanship. I should not forget to mention a font of the 14th century, a really beautiful piece of ornamental metal-work, which I must regret not having had time or opportunity yet to get photographed. It is of bell-metal, and comes from the old church of Bardewick, near Hamburg. It is ornamented with subjects in relief, the Crucifixion, the Virgin and Child, the Evangelists, with a pretty running border round the top and bottom. What is most noticeable is the four supports in the shape of figures. These figures, characteristic and full of expression, have all the appearance of raising and supporting an immense weight ; two opposite stand stolidly and squarely, hands on hips, while the others have both hands to their shoulders, with their heads screwed aside with a vivid expression in the whole pose of sustained effort that is almost, but not quite, pain. The base is decorated with small scraps of work ; the Dove of the Holy Ghost, rosettes, flower-de-luces, a head in a tall hat, and similar vagaries of the Gothic mind.

I wish, in my concluding article, to give a slight sketch of the jewel-room in Musée de Cluny, together with a note of the early and interesting objects of personal use and adornment that are to be found in some of the other rooms. The collection is small, but, as many of my readers will know, a remarkable and historical one.

◆

HOUSE PAINTERS AND DECORATORS IN CONFERENCE.

THE annual convention of the National Association of Master House Painters and Decorators was held on Tuesday and Wednesday, in the Art Gallery, Newcastle-on-Tyne. The President (Mr. G. G. Laidler, Newcastle), in his address, looked forward to the time when the Association would be not an association for England and Wales only, but for the United Kingdom. The institute was intended for the education of all connected with their trade, and in elevating the trade to a higher level their real work lay. Their Association was solely for the purpose of looking after the interests of their trade, and was therefore purely a business association, and it was on that ground they took their stand. They were entitled to congratulate themselves on having in twelve months established that Association so firmly. With regard to the apprenticeship question, he believed the operatives' societies were as anxious as they were that young men should be apprenticed to the trade. In connection with that matter the question of technical instruction was of the utmost importance. They owed their thanks to the manufacturers for the great improvement and artistic development of all goods used and for the strides made by them, not only in the improvement of paperhangings, but of those raised materials of so many kinds which now did so much to adorn the mansion. He knew of no country in the world where so many materials were produced for interior decorations. The vast superiority of these over any goods produced on the Continent was remarkable. This country had now distanced all competitors, not only so far as the cheaper, but the better, kind of goods were concerned. There was considerable overlapping on the part of the joiners, so far as the painter's and decorator's work was concerned, and on many jobs much of the priming and glazing was done before the painter came. No trade, however, was so closely allied with theirs as the plasterers. He should be glad to see more mutual assistance and combination in framing rules as between one society and another. He took it that every trade should have a sufficient complement of apprentices, so as to provide a sufficient body of efficient workmen. The President then touched upon the question of what was the best kind of house decoration, and expressed the opinion that probably the simplest was the best.

The secretary (Mr. W. E. Sutherland), in his report, stated that in the North they had a representation and connection of which any association might be proud, and it was their intention in the coming year to strengthen their hands in the Midlands and Southern districts. They had an organisation the framework of which was spread from the Trent to the Tweed, and it only needed courage and resolution on their part to extend the work until it embraced the entire country covered by their title.

The report was adopted, as was that of the treasurer, Mr. Thomas Preston.

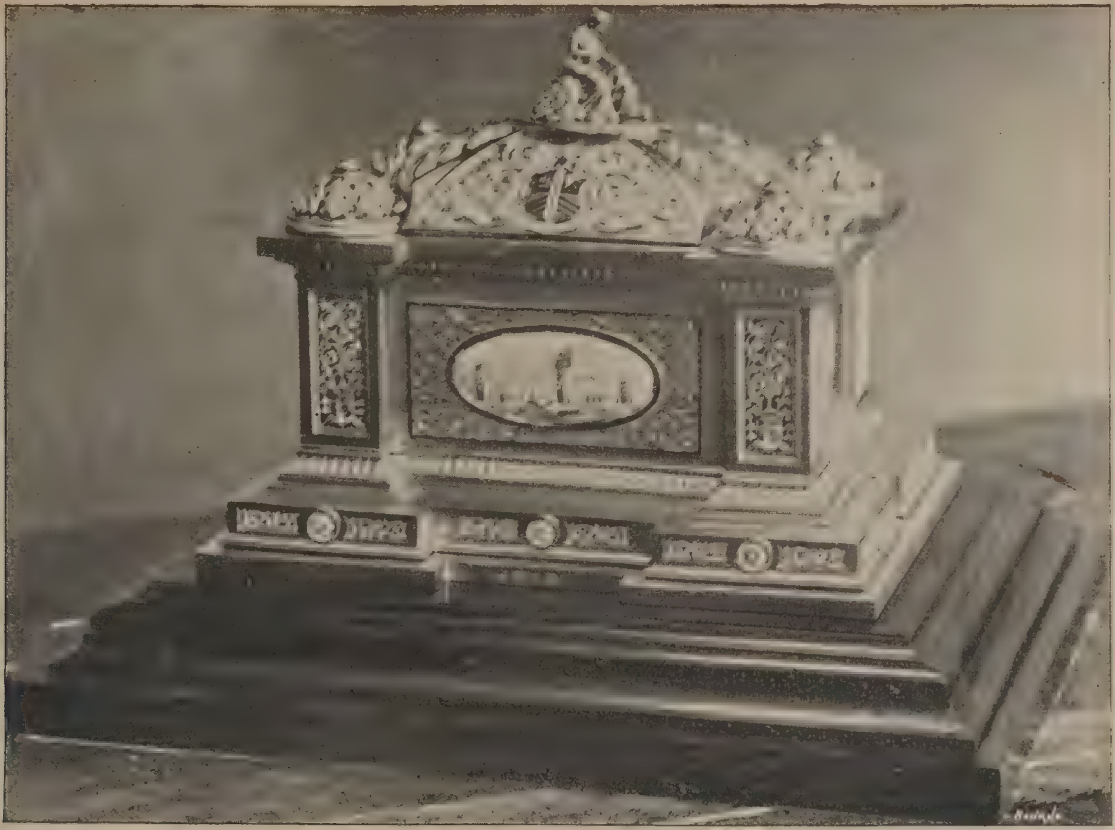
The consideration of the rules and the reports of committees occupied the remainder of the afternoon sitting.

At the evening sitting, the secretary read a paper by Mr. George Kilpack on "The Painting Trade in Relation to the Home." The writer pointed out that people should be educated to loathe filthy wall and other surfaces as much as they did a tainted water supply or bad drainage. The decomposition which wall-papers underwent, unless specially prepared, afforded a means by which disease germs could be brought into activity. The object to be attained by sanitary surfaces was even now but imperfectly understood by the mass of the people, even if it were by the more educated classes. The diminution of oxygen was not the particular evil to be guarded against in rooms, but the addition to the air of harmful gases. Bedrooms should have surfaces which could receive daily attention. The writer also spoke in favour of the sanitary and æsthetic value of a generous treatment of colours in the home.

Mr. T. R. Spence, of London, the architect of St. George's Church, Newcastle, read a paper entitled "Some Thoughts on Interior Decoration." Why, he asked, should English dining-rooms present a never-varying appearance? Why should they always be in solemn tones of red and brown? Why should we revel in furniture solemn and ponderous? The common practice was to treat ornament at considerable heights in the same delicate manner which they would apply to a casket or any decorative object whose position was close to the spectator.

◆

The market at Tokenhouse-yard was steady throughout last week, and the signs of a general improvement were maintained. Residential properties were somewhat difficult to dispose of, nor was there much demand for properties of a speculative character ; but sound investments were well sought after, and obtained satisfactory prices. The aggregate for the week was £50,100.



CASKET CONTAINING THE SCROLL OF FREEDOM OF THE BOROUGH OF WEST HAM, PRESENTED TO MR. J. PASSMORE EDWARDS.

MR. PASSMORE EDWARDS AND WEST HAM.

PRESENTATION OF THE FREEDOM OF THE BOROUGH.

THE presentation of the Freedom of the Borough of West Ham to Mr. J. Passmore Edwards took place in the large assembly room of the Town Hall on Wednesday afternoon. The ceremony was presided over by the mayor, Alderman J. Hay, J.P., who was accompanied by the town clerk, Mr. Fred E. Hilleary, Mr. J. Passmore Edwards, and Mr. Harry Passmore Edwards. Among others present were the mayoress (Mrs. Hay), Mrs. Passmore Edwards, Mrs. Clark, Mrs. Harry Passmore Edwards, Mrs. Alderman Kidd, Mrs. Hilleary, Mr. Ernest Gray, M.P., the whole of the aldermen and councillors of the borough, and the corporation officials.

AN ADDRESS OF WELCOME.

The Mayor, prior to calling upon the Town Clerk to read the address of welcome to Mr. Edwards, remarked that he was pleased to be there in his capacity as representative of the people of West Ham to welcome Mr. Edwards, who was well-known and universally admired. (Applause.) The address about to be presented would contain the sentiments and feelings of the whole of the burgesses of West Ham. (Loud applause.) The Town Clerk then read the address.

THE SCROLL AND CASKET.

The Scroll of Freedom, contained within a beautiful gold casket, was then presented to Mr. Edwards by the Mayor, his worship remarking that no one was more deserving of the honour than the present recipient. Mr. Edwards was their first free burgess, and he hoped he would live long and pay them occasional visits. (Applause.) The gold casket is a splendid work of art, the panels containing illustrations of West Ham Hospital, the Public Hall and Library, the Town Hall, and the Parish Church, and at one end is a lighthouse in half relief, and at the other end a figure symbolical of literature. The entire handiwork is surmounted by a figure of Charity. The Scroll of Freedom bears the borough arms and seal, and is signed by the town clerk, Mr. Hilleary.

MR. EDWARDS'S REPLY.

In responding to the presentation, Mr. Edwards, addressing the audience as "fellow burgesses," begged to be allowed to congratulate himself on being the only "free man" of the Borough of West Ham. He wished to say that that was not the first nor the second time that the freedom of cities and boroughs had been presented to him. (Applause.) The first one was at Truro a few years ago. Truro had existed for at least a thousand years; it had been a privileged community for that long period of time; yet it had only a population of ten thousand people. West Ham had not existed a thousand years; nor, in its present capacity, a hundred years, and yet West Ham to-day had more than five times the population of Truro. (Applause.) He looked upon

THE GROWTH OF WEST HAM

as one of the most interesting and phenomenal events of modern times. (Applause.) There were ten old British cities with smaller populations than West Ham. These were Truro, Salisbury, Winchester, Wells, Canterbury, Rochester, Peterborough, Ely, Durham, and Chester; and West Ham had 20,000 more than the united population of these ten old cities of the country. (Applause.) The question to be decided was, Whether West Ham should or should not go on increasing in this way? If it did, what would it be in the future? He was not sure that the time was not coming when they would find themselves in the same position as "the old woman who lived in a shoe," and who "had so many children that she did not know what to do." (Laughter.) At all events, it was an important thing that London in general and West Ham in particular should be increasing so in population. One of the greatest Germans living had said that great cities would be the grave of great Empires; and he (Mr. Edwards) was not sure that the time was not coming when

THIS POPULATION QUESTION

would have to be considered more widely and more deeply than at present. (Applause.) In the mean time they must do what they could to sweeten the atmosphere around them, to protect the sick, to build up the broken-hearted if necessary, and to thus brighten and strengthen the foundations of this great Empire. (Cheers.) Anyone reading the *Times* correspondence that morning would find that there was a strong feeling growing up in all parts of the world against England. England had scarcely a great national friend in the world at the present time; therefore, let England be friendly to herself. (Cheers.) Let them be true to themselves. Let them build up strong and stalwart citizens, improve their minds, give them opportunities of physical recreation and technical instruction, and he believed that England, with its thousand years of the past, would have another and a richer thousand years in the future. (Cheers). Rome had passed away, but the influence of Rome lived with us to-day, and was, perhaps, as great a power in Europe at the present time as even the Latin Church itself. All this had taught us that Empires might pass away, but their influence remained. The British Empire was a greater fact than Rome ever was, and it was for Englishmen to see that the Empire was strengthened and maintained. (Cheers.) This brought the proceedings in the assembly-room to a close.

A LUNCHEON

was afterwards provided for the principal visitors and the members of the corporation. The Mayor presided, and, after the usual loyal toasts, proposed the health of Mr. Passmore Edwards. Mr. Passmore Edwards, who was enthusiastically cheered on rising to respond, said he was pleased to know that 40 out of 41 members of the Council had voted in favour of conferring the Freedom of the Borough upon him. (Hear, hear.) Referring to the little contention that had arisen about amalgamation, he pointed out that London was one, England was one, Europe was one, humanity was one, and universal nature was one. (Applause.) It was only by sinking individual differences that great ends could be achieved. (Loud applause.)

VISIT TO THE HOSPITAL.

Subsequently the Corporate party paid a visit to the West Ham Hospital, the new wing of which, presented by Mr. Edwards, is now open. The first floor is to be named after Mrs. Passmore Edwards, who has furnished it as a children's ward, and the ground floor after Mr. T. R. Roberts, who had added £1,000 to the £3,000 given by Mr. Edwards.

The corporation of Richmond, Surrey, are erecting a number of workmen's dwellings, from plans by the borough surveyor. Twenty-one of the cottages are now occupied, and twelve others are nearly completed. Messrs. S. N. Soole and Son are the contractors.

ARCHITECTURAL ASSOCIATION.

THE inaugural meeting of the Architectural Association for the session 1895-6 was held in the meeting-room of the Royal Institute of British Architects on Friday evening. Mr. W. Douglas Caröe, M.A., F.S.A., the new president, occupied the chair, and there was a crowded attendance of members and visitors, including several ladies.

Mr. F. T. W. Goldsmith, vice-president, late hon. secretary, moved the adoption of the report, the main features of which were epitomised in our issue of September 20, p. 428, when reviewing the A.A. Brown Book, in which it is embalmed. He mentioned that the chief characteristics of the report were the marked improvement in the quality of the papers read at the general meetings—a subject to which the committee had given earnest attention—and the consequent increase in the numbers attending, and greater spirit in the subsequent discussions. Mr. A. Beresford Pite seconded the motion, which was unanimously adopted. The adoption of the balance-sheet for the past session was moved by Mr. Hampden W. Pratt, hon. treasurer, seconded by Mr. Francis Hooper, and agreed to, a vote of thanks being accorded to the auditors, Messrs. E. Howley Sim and Buss.

A vote of thanks to those who contributed to the success of the A.A. Excursion to Gloucestershire in August last by throwing open mansions and churches, and other places of interest, was proposed by Mr. B. Flight Fletcher, hon. secretary, and carried by acclamation. The President announced that the conversazione would be held on that day fortnight, Friday, the 25th inst., at the King's Hall, Holborn Restaurant. Forty-one nominations for membership were read.

MEDALS AND PRIZES, SESSION 1894-5.

The President then distributed the awards for the past session in accordance with the following list: A.A. Travelling Studentship (Bronze Medal), H. J. Triggs; Measured Drawings Prize, A. Bryer; Essay Prize (Silver Medal), T. A. Abbott; Mr. James Brooks' Prize, P. R. Smith; Discussion Section Prize, C. H. Fowler; Oliver Prize, H. C. R. Hide, first prize; A. J. Roddis, second prize. List of Medallists, Session 1894-5.—Division I.: E. P. Wheeler, silver medal; A. Smithers, bronze medal; C. F. Dawson, hon. mention. Division II.: P. J. Groom, silver medal; E. Bates, bronze medal; E. H. Evans, hon. mention. Division III.: C. W. Surrey, silver medal; A. H. Allan, bronze medal; F. Catling, hon. mention. Studio.—Division I.: H. C. Bathurst, silver medal; C. Martin, bronze medal; J. G. N. Clift, hon. mention. Division II.: H. C. Trimnell, silver medal; H. C. R. Hide, bronze medal; S. Perkins, hon. mention. Division III.: J. R. Stark, silver medal; J. Hunt, bronze medal; J. W. Abraham, hon. mention. List of Prizes and Certificates.—Division I.: E. P. Wheeler, Certificate and Prize Greek and Roman Orders; A. Smithers, Certificate and Prize, Materials and Construction; A. Smithers and E. P. Wheeler, Certificates, Perspective; C. F. Dawson, Certificate and Prize, Elementary Physics. Division II.: E. H. Evans, Certificate and Prize, English Architecture; G. H. Paine, Certificate and Prize, Materials; S. Perkins, Certificate and Prize, Elementary Ornament; P. J. Groom, Certificate and Prize, Stresses and Strains. Division III.: P. W. Meredith, Certificate and Prize, Practical Design. Extra Subjects: E. P. Wheeler, Certificate and Prize, Plane and Solid Geometry; W. Hearn, Certificate and Prize, Land Surveying; C. W. Surrey, Certificate, Quantity Surveying; H. C. Lander and A. T. Griffith, Certificates and Prize, Modelling.

INAUGURAL ADDRESS.

The President, in giving the opening address of the session, pointed out that the Association exists primarily and expressly as an educational force, and has so existed for nearly 50 years; its history groups itself entirely around this object, and shows this as its original and ultimate end. Since its creation 48 years ago by Mr. Gray and Professor Kerr, the first President, from the embers of a not too prosperous benefit society of architectural draughtsmen, the Architectural Association has had some necessary changes in methods of education; from the system of instruction by mutual criticism has grown that of instruction by voluntary visitors, which continued until 1891, and made the classes so deservedly popular. Towards the close of the last decade, however, continued the President, it became evident that some change would be inevitable. The influence of the new condition of things at the Institute was making itself felt. The Voluntary Examination of former years had developed in 1882 into the compulsory examination for admission to Associateship of the R.I.B.A., and we were all by the ears with a new system and other standards erected among us, necessarily to be acknowledged and dealt with as with existent facts. Five years ago it was felt that systematic teaching had become a *sine quâ non*, and we undertook the reform in our system with a will. Our chief energies were devoted to the admirable task of perfecting and improving our schools and our system of education, of revising them as new needs demand, and of bringing them into direct agreement with the requirements of the time. We now have before us the results of four years' working of the new scheme, and in the year 1893-4 we had the satisfaction of proving that with the aid of the Institute the new scheme could be made financially successful, leaving us with a substantial balance. But a meeting of the ways has come, and other causes have been at work which demand a new adjustment. The session just past does not show the desired continuation of this success, and we have to regret a considerable falling off in our students as well as in the number of our new members, though the work done in our classes and studios has been of first-rate quality. Your committee set itself to fathom the cause of the dwindling numbers, and finally a special committee was formed to investigate and to report upon the whole scheme. The slackening of our success last session was, I believe, due to passing and not to permanent causes. The number of incipient architects cannot be absolutely the same, session by session, and when trade is bad we must expect lean years. The discomforts of our too small rooms may have had something to do with the decrease in our numbers of this year. But apart from these, other causes have also been at work, and first of these is the re-organisation of the examinations at the Institute. Now, shall our course of study acknowledge these examinations and aid in preparing for them? or, shall we stand aside on the neutral ground of giving a good and thorough architectural education, not of a nature to be best tested by examination alone? or again, shall we oppose these new tests of a merely stereotyped efficiency by formulating our scheme on different lines, and with an intentional disregard to the standards and arrangements of the Institute examiners? I should like to make my own position clear, having myself been a Memorialist, and holding still every jot and tittle of the beliefs that that body strove to make clear, differing only from it in its final and exaggerated antagonism to the Institute. I hope that before many years are out the most eager advocates of architecture by examination will have found that no form of diploma, no corollary of significent letters, will in any way advance the cause we have all at heart. Already I hear whisperings of the failure of these ideals so plausible and promising; how the man who was safest in marks is not the surest in merit. The examination is the safeguard of those alone who look no further than an official guarantee of stereotyped efficiency—the terror of those whose hope is for the freest and fullest development of the artistic spirit. Nevertheless, I know well that our modern world will never more be persuaded to run its appointed course off its chosen rails of degree and diploma—the examination in some form or other we shall always have with us; and to some natures, to some types of mind, it may possibly be not only necessary, but expedient. We must admit this necessity, and must acknowledge the dangers of this modern tendency, and must arrange both our own scheme of life and the curriculum of the Architectural Association accordingly. The only way in which we can combat the examination evils is by the provision of an adequate, thorough, and intelligent education for the many-sided calling of an architect, which shall maintain as its standard and its keynote that "cramming shall not be." We have so often agreed upon the main needs of an architect's education that it is enough to restate them concisely. (1) That the system of pupilage or apprenticeship is good as far as it goes, but that it does not go far enough. (2) That it should be supplemented by systematic training by skilled instructors. (3) That that training should be directed to stimulate the artistic faculty—to order the imagination, to give the necessary practical as well as theoretical knowledge in all the accessories of the craft; in short, should consist of work in studio, lectures, classrooms, and in workshop. The committee has accordingly decided to bring classes and studio work into line with the requirements of students for the examinations. The Institute has met us half-way, and altered the dates of its summer examinations, both intermediate and final, to suit our classes. At the same time, we leave it to the free will of our students to enter for the examinations or not, as they think fit; and we continue a goodly number of classes which are quite beyond examination requirements. But we go further in an opposite direction to that suggested by mere preparation for examinations. Before 1891 all classes were on the self-help system, the chief of them being those of design, elementary and advanced. We have formally reinstituted these old classes, with their excellent system of visitors, upon a basis that all will approve. Thus the old and new ways meet, leading us to a new feature which has been almost a dream for many years past to those connected with the management of the Architectural Association—viz., the establishment of Handicraft Classes. I do not say it is necessary for us to be highly skilled in each craft, but we do want to be able to handle materials intelligently, and to have constant opportunities of watching others handle them deftly; and this practical training is so much the more helpful if it is acquired side by side with the more theoretic knowledge evolved from the lessons of the past. It seems a wasteful policy to multiply classes in any subject beyond the demand for them, and inasmuch as excellent handicraft classes already exist in the Metropolis, it would seem even a greater advantage to our students to secure for them the entry of these, than to undertake the organisation of competing classes on our own account. The Polytechnics of Battersea and Chelsea have thrown open their doors to the architectural student, and negotiations are now afoot which, I hope, will prove successful for the admittance of our students to the classes conducted by the Carpenters' Company, at the Trades Training School in Great Titchfield-street. Thus we have remodelled our teaching, forming some of it anew, making some of it continuous of our happiest traditions of self-help and mutual aid. Some of us are prepared to go further, and ask if we may not open our schools to others outside our elected members. May we not offer our educational advantages (let us say) to the engineer and the builder, while our social privileges and Association should remain our own, and need in no way be touched by this proposition? A sub-committee has, in fact, reported in favour of this view, subject to very necessary reservations. Meantime, let us put our house in order, that when new learners come, whoever they be, all may be ready; that the question of house-room may be efficiently solved. Our own work has already been much hampered by our narrow and not too convenient limits. This cannot be treated as a question of funds alone, but as a primary need of our continued existence as a successful corporate body. A sub-committee has been employed in the search, and has laid a promising proposition before us, which it would as yet be premature to discuss. Should it prove necessary to make an appeal at an early date to the whole body for support, I feel confident that this will be gladly given, not only by members of our own Association, but also by our many friends and well-wishers within and without the profession. Day classes must next be started, with day schools of handicraft. There is another phase of this question of education to which our attention has been lately drawn—the better education of the British workman. The men themselves have so far stepped in to render our own efforts in this direction abortive. At present the labours of our committee are in abeyance, though I hope that steps may soon be taken by which these labours may be resumed. The Plumbers' Company are conferring upon us all, architects as well as plumbers, the first of benefits in encouraging the spread of apprenticeship. Other City Companies are also working to the same end, and it behoves us all to further this as far as we can. An architectural school is said to be in the making, backed by the rates of London, by the enterprising L.C.C. Of course the questions must occur to us—Is there room even in London for two important schools to exist side by side? Will a supply of students be found to support both? If the County Council desires to expend its energy, or the funds at its disposal, in the direction of architectural education, would it not do well to assist us still further to extend our sphere of usefulness? We certainly demur to the statement in Mr. Llewellyn Smith's Report to the Special Committee on Technical Education, that we carry on our work "tentatively," or "may at any time fall to the ground." We are neither tentative nor moribund. We are already "a school of architecture"; but we are quite ready, under conditions to be agreed, to "be developed by the assistance of the Council." We shall before long have the opportunity of hearing from Mr. Lethaby the direction which it is proposed shall be taken by the proposed L.C.C. Architectural School. His views upon the subject we have already learned. "Handicraft" is his keynote and ultimatum; the architect, again the master-builder, shall leave history and theory and learn how to build with his own hands, and construction shall come to him in Nature's school through the touch of her materials. Mr. Lethaby has to reconcile his advocated method of training, itself based upon the achievement of the past, and known to us through history alone, with his demand for the abandonment of all derivative and all teaching from the historical past—also for the application of ideals to the accomplished facts and complicated requirements of our century. Whatever our methods of teaching and training, let us educate our eyes, strive to see and understand Nature's harmonies and restraints. We have a heritage, daily dwindling, of characteristic beauty in our English landscape. Let us see that by no act of ours any particle of our inheritance shall be stolen from our sons. The President descanted on the vandalism which has disfigured so many a country side by the introduction of alien materials into the buildings, quoting, as an illustration, the Manchester waterworks buildings at Thirlmere, where the dam-wall is battlemented in imitation of Gothic work, and the turncock's cottage is dealt with as a pseudo-castle, vulgar in its treatment and details, and bedizened with dressings of glaring red stone imported from Scotland into the very centre of a grey-stone district. In these days of rapid and easy railway transit, the choice of materials is, the President added, freer than in the past, and in the great towns imported material must be employed. Yet in each town there are certain materials which weather better and look better in the weathering than any others. But in the country side in the use of local material lie safety, harmony, and enduring honour. In its own district, a stone wears best, looks best, weathers best; timber construction will have its best value; native slates for our roof, where such there are. If the district affords no fitting materials for roof or wall, then our choice must be of those which harmonise the best with the character of the country. The question of cost you must perforce heed, but do not leave the other unheeded. Some of the most glaring examples of misapplied materials occur where the reverse of economy is the result. In the towns our first duty should be to study our neighbours, never forgetting the demand upon us for our share of a dignified whole, and should treat an exceptional site with special consideration and deference. Let us show our public what good architecture is; let each do his part, however small that part; seek out the principles underlying the greatness of the great architecture of the past and of our own day. Study our own time, its need and its achievement; observe its excellence, and we need not spare its faults, and then when the crucial test and the happy moment of designing comes, our houses will no more be as "the houses in between," but a part of the City Beautiful which it lies with us to bring into being. In our self-education there occur opportunities which we are prone to misuse or waste—viz., the important aid that such bodies as the Association or the Institute might render by general and genuine mutual criticism of the work done, to be done, or in the doing. We are public servants, and should be able to bear both from an educated public and from each other generous and wholesome expression of critical opinion concerning our productions. We must criticise ourselves and each other, that the public in its turn may acquire the knowledge to do so, and the Press the desire to understand. The public now desire not quiet beauty, simplicity, and proportion, but what they are pleased to call "the picturesque"—a spurious, wilful inversion of order and dignity, a subordination of proportion to the unusual, the unexpected, the novel. Examples both of the real and spurious are many. To find one where they are well contrasted, we need only look to the reach of the Thames between the Albert and Chelsea Suspension Bridges. I knew of no finer bit of grouping and outline than the quite exceptional terraces, the charm of which we chiefly owe to two men of genius—Mr. Norman Shaw and the late Mr. E. W. Godwin—with their surroundings of tree and river, and, beyond, Wren's noble Chelsea Hospital. Here was the genuine picturesque, not aimed at in the individual works, but developed in their total effect. But the plot of land between the terraces and the hospital has lately come into the market, and a long block of (no doubt) "commodious residences replete with all modern improvements" has sprung up, to the final destruction of the exceptional beauty of the spot. We are compelled to suppose that these buildings aim at the picturesque. They are planted upon the ground like an ill-drawn parabola — the two ends straightened with a connecting curve—no part of it having the slightest relation to the lines of hospital, river, or terraces. Bay windows, balconies, the inevitable angle-turret, alternate gables with capricious differences of outline, some of them mere shams of elevated brickwork, iron-stayed; a gratuitously broken line of roof, all make up a composition the like of which may be studied as an example of the power of bricks and mortar to mar a great opportunity and a great site. Chelsea Hospital may have even the better part in the view of the neglected back scornfully turned in that direction. No oriel windows and angle-turrets could be spared for a mere back—to be "picturesque" in front makes all other considerations superfluous, it seems. Let us simplify our fronts, and not overlook our backs. An instance of a well-treated and considered back may be found in a small new building overshadowed by the School Board Offices on the Temple Embankment. One burning subject remains for our consideration—that of competitions, on which I will say a word from the standpoint of architects generally and of assessors in particular. The Institute has again organised a Competition Committee, which it is hoped may exercise a speedy and beneficial influence upon the conduct of competitions. There has been certainly improvement in the last few years, but cases of gross injustice are still too frequently recorded; nor is it apparent to me how any protest can avail much. We must act, not protest; and we have the matter in our own hands if we will act together. If no reputable architect will become a competitor unless there is first appointed a professional assessor, whose award shall be final; if no reputable architect will become an assessor unless his award is to be so accepted, the matter will cure itself. The discovery of any touting on the part of competitors should be at once sufficient ground for the elimination of their names from the rolls of any honourable society. Especially to assessors we might commend the firm attitude suggested, for there is no doubt that a sure and honourable basis for the distinction of true merit by an adequately trained judge would be a real benefit, as much to the public as to the architects themselves. The Building Act for London seems, on the whole, to be working smoothly, but it is evident that an Amending Act will soon be necessary. It should now be our object to induce surrounding local bodies to amend their by-laws in accordance with the better provisions of the new Act. In conclusion, let each of us look to it that no temptation, no laxity or laziness, no greed of easy gain, and, may I add? no client, turn us from the right path. This Association is *Alma Mater* to many of you, and will be as years go by, to an ever-increasing number. As well as the earth on which we build, we dishonour her by any but our noblest efforts; if we give of our best, we are still but debtors.

> "My new cut ashlar takes the light
>   Where crimson-blank the windows flare;
> By my own work, before the night,
>   Great Overseer, I make my prayer.
>
> "If there be good in that I wrought,
>   Thy hand compelled it, Master, Thine—
> Where I have failed to take Thy thought,
>   I know, through Thee, the blame is mine!"

In proposing a vote of thanks to the President, Professor Kerr claimed for the A.A. classes that they were the best practical means yet devised for the end in view. The Association served three main ends—firstly, preparation for the Institute examination, which moreover served an indispensable purpose, although he was not one who attached great weight to examinations and diplomas; secondly, the preparation of young men for their practical business as architects; and thirdly, to obtain greater recognition of the principle of artistic grace in their buildings.

Mr. H. O. Cresswell, another past-president, seconded the motion, which was carried.

"BUILDING NEWS" DESIGNING CLUB.

AWARD OF PRIZES, SESSION 1894-5.

THE following is the text of the record of work done determining the winners of the prizes, which we award in accordance therewith.

"Sphinx," 1st prize, £10 10s., Mr. C. A. Battie, 462, Hornsey-road, Hornsey Rise, N.

"Heather," 2nd prize, £5 5s., Mr. E. G. Collins, 47, Henslowe-road, East Dulwich, S.E.

"Nyoola," 3rd prize, £3 3s., Mr. T. A. Pole, 2, Great Coram-street, Russell-square, W.C.

Hon. mention is obtained by "Jackeroo," Mr. H. A. Crouch, 2, Great Coram-street, W.C.; "Morris," Mr. W. M. Carter, Precentor's-court, York; and "Stormfiend," Mr. W. H. Warwick, Dalkeith, Iffley-road, Oxford.

LIST OF SUBJECTS AND RECORD OF SCORES.

A.—A Moorland Church.—"Sphinx," 1; "Ictinus 2nd," 2; "Red Rose," 3; "Myst," 4; "Heather," 5.

B.—Hall Fireplace.—"William of Sens," 1; "Storm Fiend," 2; "Nyoola," 3; "Red Rose," 4; "Ictinus 2nd," 5.

C.—Model Dairy.—"Sphinx," 1; "Albyn," 2; "Blundella," 3; "Just My Luck," 4; "Calcutta," 5.

D.—Parsonage.—"Morris," 1; "Sphinx," 2; "Just My Luck," 3; "Red Rose," 4; "Calcutta," 5.

E.—Railway Station.—"Sphinx," 1; "Jackeroo," 2; "Nyoola," 3; "Floreat Sherringham," 4; "Storm Fiend," 5.

F.—Dining-room Buffet.—"Sphinx," 1; "Ictinus 2nd," 2; "Calcutta," 3; "Morris," 4; "Heather," 5.

G.—Labourers' Cottages.—"Jackeroo," 1; "Wykehamia," 2; "Sphinx," 3; "Red Rose," 4; "Nyoola," 5.

H.—A Parish Council Building.—"Heather," 1; "Wykebamica," 2; "Nyoola," 3; "Xedra," 4; "P," 5.

I.—A Village Club.—"Heather," 1; "Sphinx," 2; "Nyoola," 3; "Rover," 4; "Floreat Sherringham," 5.

K.—Riverside Bungalow.—"Sphinx," 1; "The Dodo," 2; "Nyoola," 3; "Heather," 4; "Xedra," 5.

RULES OF COMPETITION FOR SESSION 1895-6.

1. Drawings to be sent in within 28 days after the publication of the particulars of subjects.
2. One or more subjects will be given every month, from which a competitor may choose.
3. The drawing to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 22in. by 14in., with no washes or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts to be shown in ruled "hatching," or blocked in. The scale to be used will be given with each subject.
4. Drawings to be forwarded, unmounted, by post, care being taken to roll the short way of the drawing, as packages over 18in. long are not transmissible through the book post.
5. On entering the class (which may be done at any time) each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing, as a guarantee of good faith, the *nom de plume* the author intends to adopt boldly marked on the front of each separate drawing. To avoid confusion, each member must adhere to one motto, which should be as distinctive as possible.
6. Prizes of £10 10s., £5 5s., and £3 3s. will be awarded to the best series of designs. Our decision to be final.
7. Before awarding the prizes, any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.
8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.
9. A critical notice of the designs sent in of each series will be given in an early issue following the receipt of the drawings.

SESSION 1895-6.—FIRST LIST OF SUBJECTS.

A.—*A Country House*, to cost £3,000. To be built in red brick, and roofs covered with tiles. Stone sparingly used; but carved brick may be introduced for ornamental parts, though not too freely employed. The accommodation to provide three reception-rooms of suitable size, the relative proportions being left to the judgment of each competitor; the Hall must be made a central feature in the plan, and not be too big, and is not intended for a sitting-room. Seven bedrooms, two of which may be on a second floor and partly in the roof. Offices and bath-room to be provided. The style adopted must be suitable to the material, and a quiet but picturesque treatment is suggested, adapted to the home of a gentleman of moderate means. The entrance front faces the road on the north side; the views from the site are towards the south-west. The height of the ground-floor best rooms to be 12ft., and on the first floor 9ft. 6in.

Plans, two elevations, one section, and perspective sketch. The plans may be drawn to scale of 16ft. to the inch; other geometrical drawings to be drawn to scale of 8ft. to the inch. The site is practically a level one.

COUNTY LUNATIC ASYLUMS.—XXX.

By George H. Bibby, F.R.I.B.A.

ACCOMMODATION FOR ATTENDANTS.

The staff of attendants at the Banstead Asylum (where the patients number about 2,000) is considered by the Commissioners in Lunacy to be moderately strong, there being 64 men and 106 women available for day duty, and for night duty 12 men and 22 women. These numbers give a proportion for day duty of one to 11 among the men, and one to 12 among the women. In this asylum there are said to be a large proportion of attendants who have been for many years in the service—a fact which is of great importance to the well-being of the patients, as new and constantly-changed attendants cannot manage patients with the same advantage possessed by persons who are well acquainted with the habits and condition of those in their charge. An asylum superintendent states: "There is rather an erroneous impression that attendants are not as regularly trained as hospital nurses. I think that a better knowledge of what does occur would rectify this error. In this asylum (Banstead), at any rate, novices are made to begin at the beginning, and are moved regularly upwards according to merit. Since the duty of each subordinate post is carefully defined, and the carrying-on of the work is carefully supervised, it appears that the juniors go through a complete schooling, and are brought into contact with the patients in a manner which induces that intimate knowledge of the insane state which is the essence of a good attendant. Some of the best attendants would probably be the worst at passing written examinations and obtaining certificates."

In some asylums the changes of nurses and attendants is very great, owing, in some cases, probably, to the insufficient, unsuitable, or uncomfortable arrangements made for their *residence*, and instances have occurred where one-third of the attendants have resigned during one year. It is, therefore, necessary that every reasonable provision should be made by the asylum architect for the comfort and accommodation of the nurses and attendants, whether these be housed in the main asylum or in detached cottages.

The messroom should be placed within reasonable distance of the asylum kitchen, and some such arrangement as that shown on Fig. 45 would be appropriate for a large county asylum, the areas of the rooms being varied according to the number of patients.

By this arrangement a messroom is provided, with an adjoining scullery; but in many asylums recreation or club-rooms are given in addition, where attendants and nurses can meet for social intercourse, reading, writing, or other amusements and occupations. The club-room shown in Fig. 45 should be comfortably furnished, and should contain a piano, be provided with book-shelves, and games of chess, draughts, &c. This room is much better placed where shown than if it opened directly out of a ward or near to rooms occupied by patients; in the latter arrangement, there would be constant opportunities for neglect of duties. In large asylums a billiard-room might be placed in a similar position to that shown on Fig. 45, and also be used as a smoking-room; a lavatory and w.c. is arranged conveniently thereto. In this block of buildings the attendants, when off duty, would live comfortably, and apart from the patients, and would receive their friends (under suitable regulations). An eminent asylum authority states that much may be done in this way "to brighten the leisure hours of the attendants, to provide them with subjects of interest, and to occupy minds that have necessarily many vacuous hours. Still, when all has been done, the need for some change of companionship—and especially for companionship with the other sex—will always make the neighbouring publichouse a formidable rival to the attendants' recreation-room. To meet this difficulty social meetings should be organised, in which the male and female attendants can meet together for friendly and social intercourse. To such meetings, held chiefly in winter and wet evenings, the women bring their needlework, and the men their pipes and games; some of the more sensible and better class of patients may be included. An officer should, of course, be always present to preserve decorum and give the initiative to the proceedings, which otherwise are apt to flag. The arrangement shown on Fig. 45 would enable this to be carried out, and is intended for the males' side of an asylum; but a similar arrangement (minus the billiard-room) would be required on the females' side.

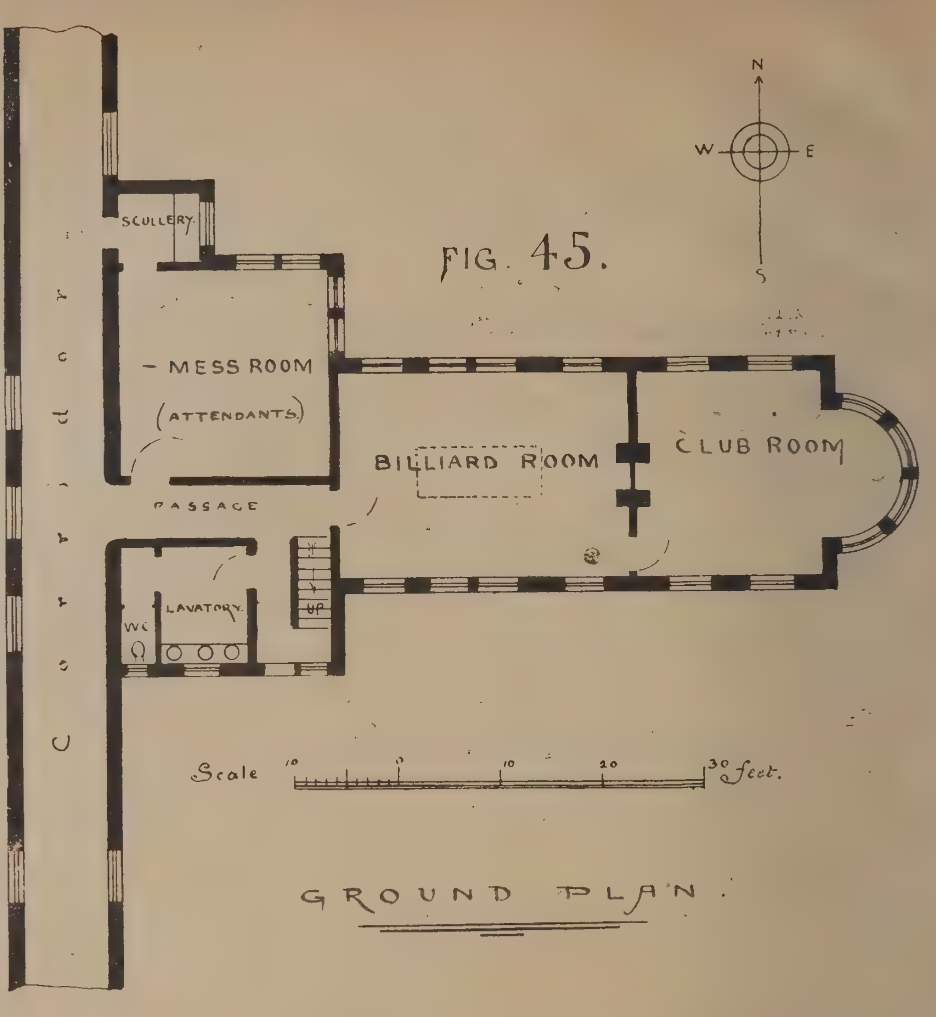


FIG. 45.

GROUND PLAN.

On the floors above these ground-floor blocks there might be provided a few bedrooms, with bath-rooms and water-closet, &c., which would serve either for the ordinary accommodation of nurses or attendants, or otherwise serve for the purpose of separating attendants suffering from illnesses and requiring quiet and attention apart from their companions.

In all arrangements of apartments for attendants, it must be borne in mind that some are nearly always absent on leave, some are watching difficult or suicidal cases, others are out on the farm or estate, and supervising the exercise of patients, while others may be ill; but it would be well that the number of attendants should not be at a less rate than one to every ten patients. With fewer than these, it is the opinion of experts that proper attention cannot be given to the patients, and that it would not be fair to the attendants that there should be a less number, having in view the nursing of patients seriously ill, or with homicidal or suicidal proclivities.

Many of the patients are frequently very noisy at night, and unless an asylum is well planned, the attendants and nurses off duty are apt to suffer from loss of sleep. There is obviously less reason in a large asylum than in a moderate-sized or small one, why the attendants should suffer in this respect, as special wards in the former instance are frequently provided for violent and noisy patients, whereas in smaller institutions all classes of officers, attendants, and patients are frequently brought into much closer conact.

The comfort and welfare of all the patients are contingent upon very greatly upon the character and dispositions of the nurses and attendants, and it is obvious that if these are not provided with properly separated residences or apartments, that the constant misery of living in ill-constructed and badly-planned rooms can only tend to impair their capabilities for usefulness by reason of all those evils that arise from loss of energy, dulness, and shortness of temper upon the part of persons associated within an insufficient or inconveniently arranged area.

In place of the billiard-room shown upon the ground plan in Fig. 45, there might be, on the female's side of the asylum, a room of similar size to be used as a music-room by the female attendants and assistant matrons and others of a corresponding grade. Thus the attendants, as a rule, would have (for both sexes) entirely distinct suites of rooms for their exclusive occupation except upon those special occasions of social gatherings to which I have referred.

The garden or grounds adjoining the blocks of buildings for attendants and nurses might (should the general plan of the asylum admit) be handed over to some of the attendants, in plots, to be cultivated for their own advantage for flowers or vegetables.

There should be one head attendant to about every thirty attendants, and his cottage or rooms might sometimes conveniently be placed near to the attendants' messroom. The number of patients in the charge of these thirty attendants should not, in ordinary cases, exceed from 300 to 350 persons. Therefore, in an asylum for 2,000 patients there should not be less than six head attendants, with about 180 ordinary attendants.

It is desirable in all buildings set apart for the use of officials, attendants, and nurses, that the staircases should be constructed in a similar manner to those intended for the use of patients, the possibility being borne in mind that a patient might wander from his ward and attempt suicide

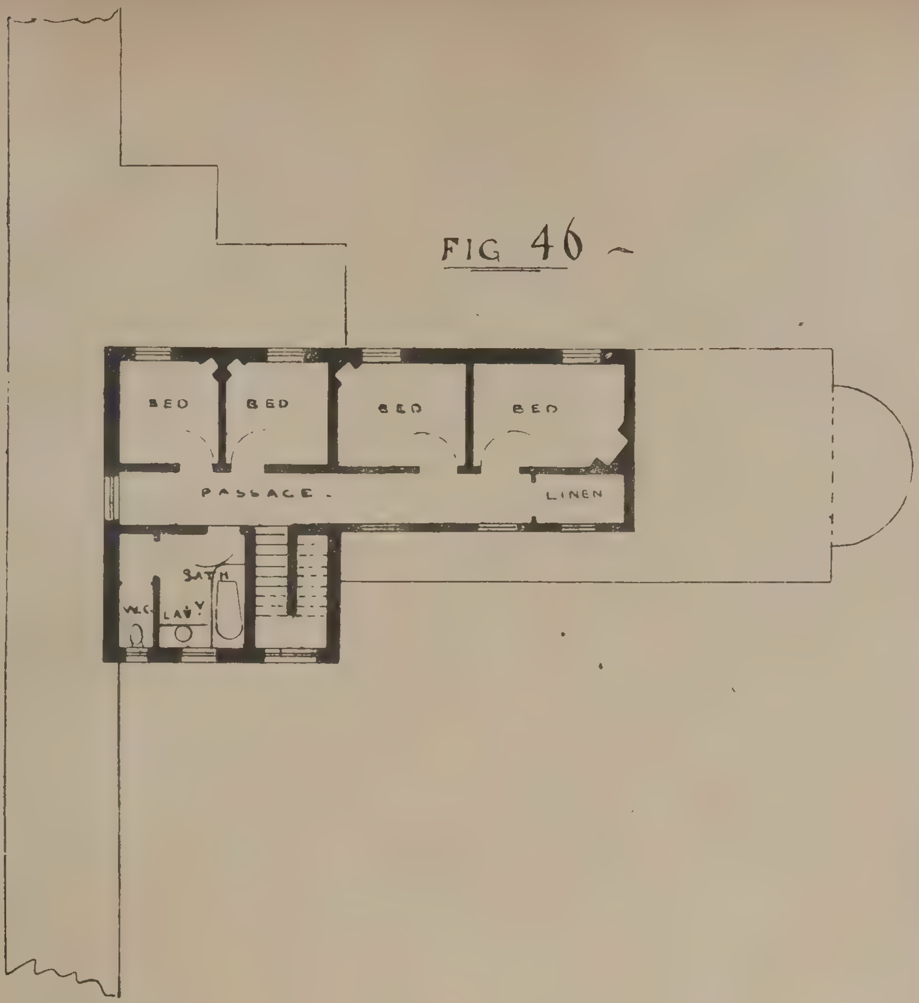

FIG 46 ~

by throwing himself from the upper levels of the staircase; therefore there should either be no open well-holes to the staircase, or otherwise, railings should be carried up to the ceilings, even in the buildings for officials.

If it be not practicable to provide every resident attendant and nurse with separate sleeping apartments, the attendants' dormitories should certainly be divided into cubicles, with every reasonable provision for privacy; but it would always be far better that most of the officials should have sleeping accommodation in blocks of buildings disconnected with the wards for patients.

In many asylums the accommodation for the attendants is very unsatisfactory. Separate mess-rooms are sometimes omitted, and some of the officials are compelled to take all their meals in the same apartment with the patients; and if in ordinary county asylums the accommodation for both attendants and patients is still very defective and insufficient, yet matters in the "short-period lunatic" wards, and in the imbeciles' wards in workhouses, appear also in many instances to compare very unfavourably with asylum accommodation generally, particularly as regards the floor spaces, heights, and cubic space permitted by the instructions of the Local Government Board, which allow in the day-rooms a floor space of 20ft., a height of 10ft., and a cubic space of 200ft. for each patient, whereas the Commissioners in Lunacy demand that "the day-rooms, of which there should be at least one in each ward, should afford not less than 40ft. superficial for each patient, not reckoning corridors of less width than 10ft. Where corridors of that or any greater width exist, the day-rooms may afford only 20ft. superficial for each patient, it being understood that a space equal 40ft. superficial be provided for each patient *in the day-rooms and such corridors combined.* Mere passages of communication are not to be considered as corridors." In other respects, the constructional arrangements for imbeciles and "short-period lunatics" in workhouses are somewhat similar to those required for county asylums.

In large workhouses, provision for the reception of "short-period lunatics" is sometimes provided in connection with the wards set apart for imbeciles; but in the smaller workhouses it is considered to usually suffice to "so arrange two wards, an *attendants' room with padded room,* that one of the wards may, if necessary, be entirely shut off from the other portion for the joint use of a patient and an attendant."

The requirements and suggestions of the Local Government Board state that the padded room may be most suitably fixed inside the attendants' room against an external wall, and in any case should be entered directly from that room. Also that the padded room should have a superficial area of about 63ft., exclusive of the padding; 9ft. by 7ft., or 8ft. by 8ft., are suitable dimensions, and there are objections to more than slight variations from them in either direction; it should be at least 10ft. high. The attendants' room should have a floor area of not less than 100ft. superficial, exclusive of the space occupied by the padded room. The padding, which may be of cocoa fibre or other suitable material, and at least 4in. in thickness, covered with indiarubber or painted canvas, should extend to at least 7ft. 6in. from the floor, and be capped with a strong slope, fixed with screws, and sloping at an angle of about 30° from the wall in order to afford no hold to a destructive occupant; the floor should always be padded, cork chips covered with indiarubber or painted canvas, so laid as to be thoroughly watertight and washable, being commonly used; it is desirable to bed the floor on concrete or similar material, to prevent damage either by vermin or dry-rot. Light may be provided by a small window of $\frac{1}{2}$in. plate glass fixed high up in the external wall; it should be furnished with a shutter either on the outer side or inside, so arranged as to lock into a recess when not in use. For artificial light a fan-light should be provided. The gas jet should be on a jointed bracket to turn away, so as to be wholly out of sight of the occupant of the padded room when necessary.

Ventilation may be furnished by air-bricks near to the wall plate, and by a strong grating in the lower 3in. of the door below the padding, when the padded-room is situated wholly within the *attendant's room,* the partition may stop about 2in. below the ceiling. Warmth in a padded-room is a specially important matter, as patients of this class are frequently inclined to strip themselves. When the *padded room* is not so situated as to share the warmth of the *attendant's apartment,* means should be provided for passing into it warmed air, either from a coil of hot pipes or from a chamber behind the grate in the attendant's room, through air-bricks in the wall, at a suitable height above the padding; a roomy approach, free from awkward angles or projections, is a most important disideratum for a padded room. The door, which should ordinarily be about 3ft. wide, should open outwards to its full extent, so that the padding on it may not diminish the clearway. The door should be so hung as to prevent danger of crushing a hand or foot in the hinges when the door is being closed, and the fastening of the door should be by means of a snap-lock, with bolts near to top and bottom of door respectively, and commanded by a single handle, and it may be desirable to arrange a supplemental drop-bolt in such manner as to allow of partial opening of the door for ventilation and inspection. Two inspection slits, the upper one vertical, the lower one horizontal (being for a lantern to light the floor where the gas-jet may fail to illuminate it), should be provided in the door. They should be protected by strong plate-glass, sunk so as to be beyond reach of a blow from the occupant.

The above suggestions for a padded-room, in connection with an attendant's room, appear to fairly solve a difficult subject.

(*To be continued.*)

NOTES FROM EDINBURGH.

THE reconstruction of the Waverley Station here, which has been going on for more than a year, eclipses in its magnitude all other work now carried out in the city. It is very much in evidence from any point of view to the east of the Mound, and more especially to the east of the North Bridge, where one can estimate the vast encroachment that has been gradually made upon the city precincts for convenience of the company's traffic. Probably, had the area of this encroachment been anticipated at the first, the goods traffic station, at least, might have had its location in a neighbourhood equally convenient, and further from the passenger sheds. A sea of dirty glass is not in happy contrast with garden-ground and grassy slopes; still, it must be confessed that the widening of the way westward of the Waverley Bridge has not made the alteration with injurious effect on the appearance of the gardens. As to the large and wider space acquired to the east of the North Bridge, nothing of any interest was left after Trinity College Church had been sacrificed to meet the exigencies of the railway, and there will be little to regret in contemplating the ruins to which the operations of the preceding year have reduced a great part of New-street and other dingy thoroughfares, with their commonplace tenements. Something better can hardly fail to rise in their place. The new tunnels have been completed for some time, the Waverley Bridge has been widened, and a vast extent of massive underground arching has been built to carry the floors, &c., of the extended station. Provision has been made for keeping open old thoroughfares between the old and new town at the lower levels, and some progress has been made with the piers of the new bridge. From the east the bridge presents itself to view as an interesting longitudinal section, and looks much better with its relieving arches exposed than the elevation on the other side. The large block of buildings at the north end of the bridge, with a frontage in Princes-street, is still standing, and as shops have been erected there to provide for tenants dispossessed in North Bridge-street, a good portion will remain while the offices are being built up from the low level of the railway. The cost of all the reconstruction scheme approximates to three millions sterling, which means a good time for the building trades, as the completion must be distant some five or six years at the earliest.

The city has a large—many think too large—share of the cost of rebuilding the bridge: £50,000 out of the estimated £80,000, and the civic authorities are very naturally falling into the habit of launching large and costly schemes, with the inevitable result that the rates are rising. They have recently purchased the farm of Colinton Mavis, where a fever hospital will be erected. The sanitary and amenity guardians have not been remiss, having lately purchased a piece of ground by way of preserving the amenity or privacy of the Arboretum, and have made a bridle-road round the Stockbridge Park, which does not improve its appearance, and seems a very needless expense, with miles of the best riding road everywhere around. Talk is heard of the city purchasing the extensive premises of McLaren and Co., in the High-street, for £17,000, and a Bill is preparing to extend the boundaries of the city by amalgamating Leith and Portobello on the east, and going round by Corstorphine and Colinton to Duddingstone. Edinburgh will thus have an area of about 20 square miles.

The Prudential Assurance Co. have done a graceful thing in yielding to the representations made by the authorities, who protested against the erection of a terracotta building alongside the stone ashlar work for which Edinburgh has long been famed. It appears that the company's building, though unexceptional in architectural design, appears to little advantage there, and their interests will not suffer, and the city be a gainer by their resolution. It is to be hoped that a proper stone will be employed, and nothing can be better than that selected for the Jenner building, which stands the weather well. Unfortunately for St. Andrew-square, at the corner opposite, a huge projection in timber has lately thrust its obtrusive and unsightly proportions on the eye, utterly spoiling the entrance from St. David-street as well. The design is a skeleton of the most commonplace details, brought out to the limits of the property, and carried up through two floors, burying the stone tenement, and leaving little visible but the gable and the chimneys. The tailoring firm which has perpetrated this obnoxious specimen of shop architecture, has no doubt succumbed to the advertising and cheap ticket style of doing business. The house is the one for which David Hume left the house he thought so much of in James-court; but this circumstance does not seem to have had any consideration given it. A mere modest addition of one story would have been much less objectionable, and the deep projection is quite unnecessary, and spoils the corner for the pedestrian who likes to turn it easily. Edinburgh is not improved by its shop architecture, more especially when it comes forward, as it does so often. The earliest samples, without projection, are invariably better. The latest novelty is making the whole shop front down to the pavement one sheet of plate glass; but this gives one the uneasy impression that the window has subsided, and it leaves a large portion of the glass exposed to accident and disfigurement of any kind.

The large addition to the High School is completed in its masonry, and is imposing in its magnitude. It stands to the east of the present building, and detached from it, on a slightly higher level, and appears to double the amount of accommodation, or nearly so. The ground plan has a central façade and projections at each side in front, and two side wings. It is thus a long building of two floors, and is altogether wanting in the picturesque variety, which constitutes the charm of the original. The details of the architecture are all copied from the plainer portions at the back, having at the roof a heavy blocking crown over the usual cornice and frieze, with pilaster corners, &c. Something might have been done to relieve the ponderous monotony with pediments, and roofs of more variety and that without additional expense.

The electric-lighting of the thoroughfares has been successful, with some slight exceptions. The consumption of gas, however, has not diminished, and the price has been lowered. The old chimney of the gasworks is insecure, and a new one of better architectural design is to be built further south—so that, in the course of a year or two, this portion of the city's aspect will have undergone transformation greatly for the better.

ENGINEERING TOOLS AT POMPEII.

UNDER the title of "Things of Engineering Interest found at Pompeii," Professor Goodman gave his inaugural lecture in the Engineering Department of the Yorkshire College, Leeds, on Friday night. The lecturer remarked that he had recently visited Pompeii, and was not only charmed by the great beauty of the works of the ancient Romans, but also by their extreme ingenuity as mechanics—in fact, it was a marvel how some of the instruments and tools they were in the habit of using could possibly have been made without such machinery as we now possess. After explaining the situation and destruction of Pompeii by showers of ashes and mud, not lava, as is usually supposed, in the year 79 A.D, Professor Goodman showed a series of about fifty lantern slides, prepared from photographs taken by himself in Pompeii last Easter. The streets, he explained, were used as waterways to carry off the surface water, and probably sewage, from the houses. The pavements were raised about a foot above the streets, and stepping-stones were provided at intervals for foot passengers. The horses and chariot wheels had to pass between, and in many places deep ruts have been worn by the chariot wheels in the stone-paved streets. The water supply of Pompeii was distributed by means of lead pipes laid under the streets. There were many public drinking fountains, and most of the large houses were provided with fountains, many of most beautiful design. The amphitheatre, although a fine structure, capable of seating 15,500 people, was small compared with many in Italy. The bronzes found at Pompeii reveal great skill and artistic talent. The bronze brazier and kitchener were provided with boilers at the side, and taps for running off the hot water. Ewers and urns have been discovered with internal tubes and furnaces precisely similar to the arrangement now used in modern steam boilers. Several very strong metal safes, provided with substantial locks, have been found. The locks and keys were most ingenious, and some very complex. On looking at the iron tools found in Pompeii, one could almost imagine he was gazing into a modern tool shop, except for the fact that the ancient representatives have suffered severely from rust. Sickles, billhooks, rakes, forks, axes, spades, blacksmith's tongs, hammers, soldering-irons, planes, shovels, &c., are remarkably like those used to-day; but certainly the most marvellous instruments found are the surgical instruments, beautifully executed, and of design exactly similar to some recently patented and reinvented. Incredible as it may appear, yet it is a fact, that the Pompeiians had wire ropes of perfect construction.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. Middleton.

XV.—FRENCH RENAISSANCE: MINGLING OF GOTHIC FORMS AND RENAISSANCE DETAILS.

AS the Gothic had been an imported style in Italy, so was the Renaissance in France; but whereas Italy had always received the Gothic as a stranger, ill-suited to the soil, France welcomed the Renaissance with open arms, and took it to herself and made it hers, developing one of the most beautiful forms of Classic architecture known as her own peculiar development. But it did not spring into existence straight away. France was Gothic, and had been Gothic for centuries, when the Renaissance was imported from Italy in the 15th century, it being there already a perfected style. The beauty of its delicate details was appreciated, but its general principles were not understood; and it is consequently no matter for surprise to find that the details were taken as they were found, and planted upon the Gothic outlines—not incongruously or coarsely, but with a refined sense of how and where this could be done with safety, which speaks volumes for the native artistic talent and good taste of our neighbours. The Gothic, we must remember, was in decay at this time—its prime was long

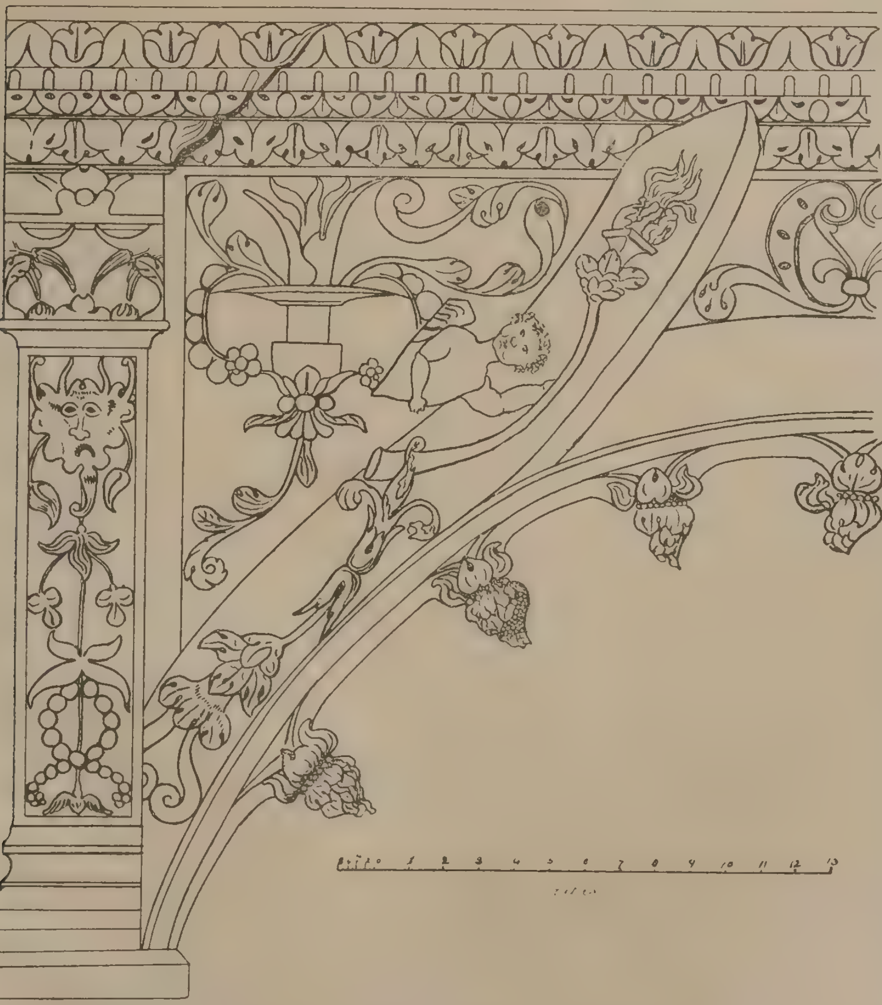
WEST DOOR OF CATHEDRAL, GUINGAMP, BRITTANY.

past; and in France it was lapsing into senility—the love of the people for the light and delicate precluding the sturdy old age, which it enjoyed in England; and the new details brought from Italy were welcome as a new covering to the old bones. That the old style was to disappear and the new clothing to take a new body to itself, making as perfect a whole as that which it supplanted, and yet an entirely different whole, could scarcely have been understood. The process was a gradual one; but it was hardly a transition so much as a gradual ousting of the decrepit old by the vigorous new.

It will thus be seen that it was not the orders which first appeared in France, nor principles of design based upon the orders, but the fanciful panelling, the mouldings, and the enrichments which went to decorate the smaller things in Italy. These could be employed without upsetting traditionally-established methods of construction which they were to be used to embellish, and even in combination, where it was convenient, with ornaments which were still wholly Gothic.



FRENCH ARCADING IN CARVED OAK. (EARLY 16TH CENTURY.)

The general effect of this curious and frequently charming combination may be tolerably well gathered from the three illustrations given herewith. To illustrate all the eccentricities perpetrated would be obviously impossible, as a free admixture always allows of great variety, and all is not equally good. For example, the east end of the church of St. Pierre, at Caen, has much the appearance of an elaborate bridecake, the detail being too small and too lavishly employed. Yet this detail itself is well conceived, even if it be a quaint rendering and curious application of Italian ornament. The general form of the pinnacle, the use of the false flying buttresses, and the gargoyle, as shown in the illustration given, are all Gothic, and yet with these the Renaissance grotesques and mouldings, panellings and semi-arches are in good harmony.

Again, the west door of Guingamp Cathedral in Brittany (whose whole south triforium is of this mixture) is Gothic in its form, and enriched with detail which might have been worked in Italy, and with truss keystones and a rectangular Renaissance hood, supported by pilasters, subordinate to the Gothic outline, and so not clashing with it. The detail of the carved wood arcading of the early 16th century shows even more clearly a combination of Gothic and Classic forms, which was by no means uncommon. A general sketch of this same arcading, by Mr. A. E. Chancellor, appeared in last week's BUILDING NEWS, and may be referred to with advantage. The arch and the cusps belong to the dying style; but the carved wreaths and scrolls are of Italian importation, and the leaf and dart enrichment carries one's thoughts back to ancient Rome and Greece.

Wanting in the breadth and dignity which is only to be found in a design whose broad principles rule its details, the work of this time of change in France is still frequently so delicately beautiful that one cannot wonder at its passing popularity amongst modern seekers after the beautiful and the original, especially when applied to small gems rather than great monuments.

A WIDE-SPAN STATION ROOF.

AN important railroad station is described in a paper read at the annual convention of this year, and given in the *Transactions* of the American Society of Civil Engineers. It is the Philadelphia and Reading Terminal Station, and is described by Mr. Joseph M. Wilson, M.Am.Soc.C.E. Several plans, sections, and views are given of the building in the above journal. The principal feature of the station is the roof of the train shed; it is a large three-centred, pointed arch roof in a single span, and hinged at the crown and springing line. We give a few dimensions. The span, centre to centre of pins, is 259ft. 8in.; the height between centres of pins at crowns and springing, 88ft. 3in.; out-to-out span, 266ft. 6in.; height from centre of pin at springing to starting point of centre curve at eaves, 33ft. 4in.; depth of arch rib at crown, 6ft.; at haunch, 12ft. 4¾in., and the pin at crown is placed in centre of depth of rib; height from pavement to centre of pin at springing, 20ft. 6in., and extreme height from pavement, 122ft. 9in.; total length, 662ft. 11in. "The exterior curve of each semi-arch has a radius of 120ft. for an angular distance of 41½° from horizontal, and thence a radius of 310ft. to the crown; and the interior curve has a radius of 50ft. for an angular distance of 39½° from the horizontal, and thence a radius of 280ft. to the crown. The arch is therefore a compound curve, four-centred for the outer flange member, and six-centred for the inner flange." Its form and proportions were designed with great care to produce an artistic and architectural effect, and agree with the requirements of economical construction. Looking at the cross section given, it presents a graceful pointed four-centred arch, the ribs widening from the crown to the springing and of open lattice bracing, and its main features resemble those of the St. Pancras station roof of the Midland Railway, London. Each semi-rib is divided into six panels by purlins, with three ventilators. The arches are in pairs, placed 50ft. 2in. apart; those of each pair are 5ft. apart to centres. "The weights from these arches are carried by wrought-iron girders acting as cantilevers, with projecting stone brackets below." The assumed loading areas are as follows: Weight of trusses, purlins, and jack rafters, 25lb. per square foot; weight of covering, 8lb., snow

12lb.; total, 45lb. per square foot. The wind-pressure was taken at 35lb. per square foot against a vertical surface, the pressure normal to the roof surface depending on the curve or angle, ranging from 30lb. per square foot at the springing to 15lb. per square foot at the crown. Full details of the roof, which is of wrought iron, are given in Mr. Wilson's paper.

OBITUARY.

Mr. Philip Henry Lawrence, F.R S., late of Lincoln's Inn and Carlyle Mansions, Chelsea, barrister-at-law, died on Tuesday at his residence, 8, Royal-crescent, Brighton, aged 73 years. Mr. Lawrence was admitted as a solicitor in the year 1848, and established a large practice in Lincoln's Inn-fields, the chief feature of which was that it included the conduct of all the heavy litigation which resulted in the preservation for the public of the metropolitan commons. It was owing very largely to Mr. Lawrence's energy and to his intimate knowledge of this branch of the law that the commons in the immediate neighbourhood of London were preserved as open spaces for the benefit of the public. Mr. Lawrence took an ative part in forming the Commons' Preservation Society, and acted as its solicitor until he ceased to practise in that branch of the profession. In 1868 Mr. Lawrence was appointed solicitor to the Metropolitan Board of Works, which post he held until its abolition, and for many years held the post of conservator of Wimbledon Common as nominee of that Board. He was the author of "Cotta on Rocks"—a handbook on mineralogy, and of "The Partition Acts, 1868 and 1876."

Mr. Robert Barker, architect's assistant, aged 46, committed suicide in a deliberate manner in his bath at the hotel, 45, Woburn-place, Russell-square, on Saturday night. It appears that the deceased, who had resided at the hotel for a considerable time, on Saturday night retired to have a warm bath. An hour afterwards he was discovered in the bath dead. The police-surgeon who was called in found that Mr. Barker had opened an artery in his left arm by means of a razor, and so had bled to death. At the inquest, held on Wednesday, it was stated that deceased had been for years in the employ of a firm of architects at 5, Bedford-row, W.C., up to a fortnight ago, when he resigned in a fit of temper, and had since been unable to obtain another situation. It also transpired that he had lived alone in lodgings, apart from his wife and children, for the last four years. A verdict of "Suicide while of unsound mind" was returned.

* * *

The electricity works of the Corporation of Newport, Mon., were opened, and the inauguration of public street lighting in the borough was made, on Monday. Under the advice of Professor Henry Robinson, Mr. Robert Hammond was appointed consulting engineer, and the works have been carried out under Mr. Hammond's supervision on the lines he has adopted at Leeds, West Brompton, Dublin, Madrid, and Blackpool. The architect for the buildings was Mr. W. Conyers Kirby.

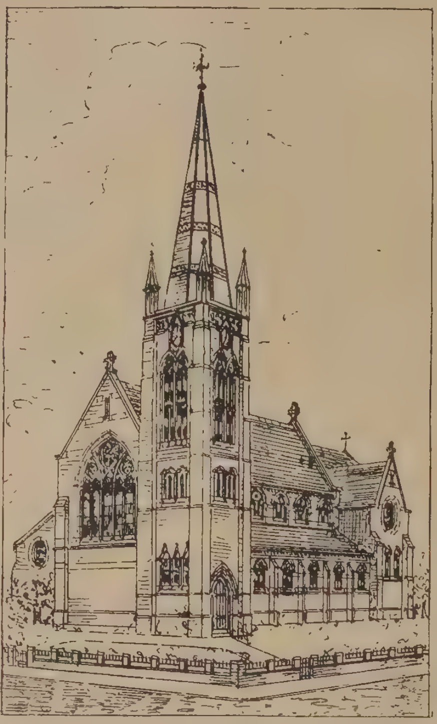
The opening of the Wear Valley extension railway for passenger, goods, and mineral traffic, will take place on Monday next, the 21st of this month. The line penetrates into the heart of a broad expanse of high hills and moors, reaching 2,000ft. above sea-level, and into an area rich in its natural soil, being on the Yoredale rocks, and, consequently, capable of cultivation to the very top, where the heather blooms. It will perhaps be known in the future as a health resort.

A staff of surveyors have been sent from London to Dover for the purpose of commencing the surveying of the area for the National Harbour, for which there was a vote on account by Parliament this year. Messrs. Coode, Son, and Matthews have been appointed engineers by the Admiralty. All the plans are to be completed by March next, when tenders will be invited. The actual work is to be commenced by midsummer next, and will be pushed on rapidly. A large torpedo station is to form a part of the work.

The new public cemetery of the district council at Shipley was opened on Saturday. The cemetery, nineteen acres in extent, is situate in Nab Wood, the prettiest part of the Aire valley. The front entrance is on the Bingley and Keighley road. The ground consists of about six acres of tableland, the rest being undulating woodland, well-timbered, with gravelly subsoil. The chapel and lodge buildings are not yet completed; but the laying out of the grounds by Mr. Dawson, the council's surveyor, is in a forward state. The outlay has been £10,000.

CHURCH OF ST. FRANCIS DE SALES, TOTTENHAM.

This church, opened on the 16th inst. by Cardinal Vaughan, is situated in the High-road, Lower Tottenham. The design of the building is in the Early Decorated style. The extreme external length is 123ft.; of this the nave and aisles take 84ft., and the chancel 39ft. The width of the nave and chancel is 24ft., and the total width across nave and aisles is 49ft. The nave is divided into six bays, the arcade is carried on quatrefoil columns with a three-light clerestory window over each arch. In the west gable is a slight tracery-headed window. The chancel is in three bays, with an apsidal end in addition, with a groined timber roof, which springs from the cloistered shafts of the arcade around it. In each of the five end bays there is a long single-light window, with tracery in the head. The nave is covered with an inner roof of pitch-pine. At the S.W. corner of the nave a tower and spire, forming the principal porch, will rise to the height of 145ft., and at the N.W. corner is the baptistery. The accommodation is for 600. The architects are Messrs. Sinnott, Sinnott, and Powell, of Liverpool.



R.C. CHURCH OF ST. FRANCIS DE SALES, TOTTENHAM.

The R.C. mission of Tottenham is somewhat remarkable. It was founded just over a century ago by one of the most distinguished of the French emigrant priests, the Abbé de Cheverus, who afterwards went to America, and became the first Bishop of Boston. At the Restoration he was recalled to France, where he was Bishop of Montauban, and finally Cardinal Archbishop of Bordeaux. G. W.

* * *

The directors of the Newcastle-on-Tyne Architectural Society have purchased an estate of 215 acres at Stocksfield, which will be laid out as a building estate, being divided into 174 plots, ranging from ¾ acres to 3½ acres in extent. Messrs. Watson and Scott, of Newcastle, are the surveyors.

The town of Portsmouth, which was redrained in 1866 on a high-level and low-level system, is in an unsatisfactory condition, although storage reservoirs were built near Fort Cumberland in 1881, under the advice of Sir F. Bramwell. The corporation have now voted £30,000 to be expended, under the direction of Mr. Philip Munch, the borough engineer, in dealing separately with the rain-water.

A public fountain at Pontypridd, provided by Mr. A. Thomas, M.P., was unveiled on Thursday in last week. It has been constructed from designs by Mr. Charles B. Fowler, F.R.I.B.A., of High-street, Cardiff, and has a stone canopy supported on four shafts. The sculptors were Messrs. Martyn, of Cheltenham, and the copper work was carried out by Messrs. Letheren, of the latter town.

COMPETITIONS.

Shoreditch.—Thirty-five designs have been sent in for the public baths, with laundry, and the free library to be built in Pitfield-street, Shoreditch. The plans are now being considered by the professional referee to the commissioners and vestry, Mr. Rowland Plumbe, F.R.I.B.A., so that the award of the combined board may be looked for at no distant date, we presume.

Bridgend.—In a limited competition for a new official block and additional casual wards, &c., at the Bridgend and Cowbridge Union Workhouse, the building committee reported the adoption of the plans of Mr. P. J. Thomas. The estimated cost of the proposed work is £3,500.

CHIPS.

The present Mayor of Southampton, Mr. Levi Button, builder, of that town, has been elevated to the aldermanic bench of that borough.

Some correspondence has passed between the Department of Science and Art and the London County Council with a view to the latter body taking over the charge and maintenance of the Bethnal Green Museum. The overtures made by the Department have not, however, been favourably entertained by the County Council.

Meissonier's monument is to be unveiled in the gardens of the Louvre on the morning of the 25th inst. The effigy of the great painter has been sculptured by Mercié. It will stand near the quay facing Raffet's memorial.

A scheme is proposed for the construction of un undercliff drive on Bournemouth promenade at an estimated cost of £35,000. Towards this sum the London and South-Western Railway Company have taken powers to contribute £10,000.

A grand jury in New York have found indictments for manslaughter in the second degree against Charles P. Behrens, the architect of the collapsed iron buildings in that city; Dennis E. Buckley, the inspector; Edward J. Youdale, the clerk; George H. Parker, the contractor; Thomas Walker, the superintendent; and Thomas Murray, the foreman mason; and they will be tried in due course.

A conference of representatives of the different authorities interested in the port of Manchester was held on Tuesday, for the purpose of considering the question of forming a sanitary authority.

The district council of Colwyn Bay decided, on Tuesday, to proceed with the construction of a promenade, at an estimated cost of £12,000, in accordance with plans prepared by their surveyor.

A statue of the late Mr. Ralph Ward Jackson, the founder of West Hartlepool, is about to be placed in the public park of that town, at the sole cost of Col. J. W. Cameron.

Dean Farrar appeals for about £300 for the preservation of the picturesque ruins of Richborough Castle. The remains have been acquired by a few donors for £1,072, and the further sum is needed for fencing, &c.

The day schools attached to the Wesleyan chapel, Ettingshall, have been enlarged, at a cost of about £900, to provide accommodation for about one hundred more children. The designs for the alterations were by Mr. R. J. Rowe, Bilston, and the work has been executed by Mr. H. Cave, Wolverhampton.

The interesting old coaching-house adjoining the Romford Brewery, the Old White Hart, which is said to be more than two hundred years old, and to have been several times patronised by Royalty, is about to be demolished.

The Great Western Railway Company contemplate applying to Parliament next session for powers to construct a new line of railway from Pilning or Patchway to Dauntsey. The places mentioned are in almost a direct line, and a considerable saving of distance would be effected by the proposed new railway, in connection with the company's service to South Wales.

The First Ordinary General Meeting of the Session 1895-96 of the Surveyors' Institute will be held on Monday, November 11, when the President, Mr. Daniel Watney, will deliver an opening address.

At Lambeth Police-court on the 10th inst., Mr. John Marsland, a builder, of York-street, Walworth, answered a summons taken out by Mr. J. P. Norrington, surveyor to the Lambeth Vestry, complaining that he unlawfully commenced to lay or dig out the foundation of a new building on certain land in Vauxhall-walk, without having first given seven days' notice in writing. After evidence had been given by the vestry's officials, the magistrate said a technical offence had been committed, and ordered the defendant pay a nominal penalty of 20s. and 2s. costs.

"THE FALL OF THE REBEL ANGELS," BY JEROME BOSCHE.—PUBLIC BATHS, WASHHOUSES, AND MUNICIPAL BUILDINGS AT DEPTFORD.—SIR WILLIAM CHAMBERS'S TEMPLE AT CLONTARF, NEAR DUBLIN.—NEW SCHOOLS AT TUNSTALL.—CHURCH OF ST. LAURENCE, BARTON, NEAR PRESTON.—DIME, OR TITHE POT, AND FISH MOULD FROM CLUNY.

Our Illustrations.

"OLD MASTERS" ON THE CONTINENT.—NO. XXV.: "THE FALL OF THE REBEL ANGELS."

There are no examples of the Dutch school in our National Gallery of so early a date as that which belongs to the strange picture which we illustrate to-day, from the Royal Gallery at Brussels, by Jerome Bosche (or Bos, as he is sometimes designated), and no specimen of this master's handiwork is included in the Trafalgar-square collection or in the Galleries of the Louvre. His repute almost entirely rests upon the curious grotesque representations of devils and incantation subjects, which he painted with so remarkable a fancy and almost unrestrained freedom. The composition of his conceptions is essentially crowded and involved, replete in minute detail, with a tendency to meteoric lininess, relieved by a sort of utricular arrangement, such as strongly marks the drawing of the subject chosen for illustration to-day. The inventive fancy of the artist seems unbounded, and his power of delineation is in every sense remarkable, as he appears to revel in every conceivable outlandish idea and every sort of contradictory pose and form. In the midst of this extravagance, carried as it sometimes is within the region of the enjoyment of wantonness, it is to be noted how reserved and dignified the painter is in each instance in the handling of his good angels who appear as the instruments of Divine justice, performing their task of punishment and expulsion without the least trace of spite or hate as they pass unscathed through the limitless abyss peopled by the condemned. Little is recorded of Jerome Bosche calling for comment here, beyond the facts that he was born in 1470 and died in 1530.

NEW BATHS AND WASHHOUSES FOR DEPTFORD.

This parish, with its population of 110,000, and a rateable value of £493,000, has been one of the few remaining instances of an important London district without public baths and washhouses. Commissioners of Baths were appointed some years ago to prospect sites, and in 1890 designs were obtained in competition for adapting the old Deptford Lecture Hall as public baths. The designs of Mr. Thos. Dinwiddy, of Greenwich, were then selected, but objections were raised in the vestry to the proposed site. Another site in New Cross-road of three-quarter acre has since been bought at a cost of about £7,000, and the commissioners instructed Mr. Dinwiddy to prepare plans for the new buildings. These plans were adopted by the vestry of St. Paul's, Deptford, and the work is in hand. The accommodation comprises a first-class swimming-bath 110ft. by 35ft., with galleries; a second-class swimming-bath 80ft. by 27ft.; slipper baths for 15 first-class and 30 second-class for men, and five first-class and ten second-class for women. There is a public laundry, and administrative accommodation for the board and clerk and the superintendent. A well on the site will supply the baths. In addition to the intended baths and washhouses, the architect's instructions comprised the provision of a new vestry-hall and offices for the parish, and the illustrations which we now give represent the entire project, showing the façade in New Cross-road. The plans clearly indicate the internal arrangements. The baths will have a frontage in Laurie-street, and of this elevation we shall give a working drawing by the architect at an early date. The builder is Mr. H. L. Holloway, the contract amount being £32,950.

CASINO AT MARINO, CLONTARF, CO. DUBLIN.

In 1757 Sir William Chambers, to the instructions of the first Earl of Charlemont, prepared the drawings for the Casino, or Temple, at Clontarf. Sir William had already made working drawings for a reproduction of the Monument of Lysicrates; but this had fallen through in favour of the present building. The principal floor contains a vestibule leading into the saloon, off which are two smaller rooms—a study and bedroom. The details of these rooms are very beautiful, the floors being of inlaid wood in geometrical design of various colours; the doors are of mahogany and cedar, with their mouldings enriched, the handles being very fine specimens of the brassworker's art. The ceiling of the vestibule is panelled, the frieze being enriched with representations of the various arts and sciences, and the portion which is semicircular on plan has a depressed semi-domical ceiling in small panels. The ceiling of the saloon has a very large cove, also panelled and further enriched; whilst in one of the smaller rooms is to be found the Signs of the Zodiac in small figures on the vaulted ceiling. The plan, which on this floor takes the form of a cross, develops on the basement floor into a square, with an area 9ft. wide on all four sides. On this floor are found kitchen, butler's pantry, and other offices, the whole being vaulted. Off the area are two vaults on each side for storage purposes. The bedroom floor contains four bedrooms, and above all is a rectangular flat, from which a lovely view of the surrounding country and Dublin Bay may be obtained. The particular order employed, Doric, is a far richer example than any given by Sir William in his work on the Orders, which may be accounted for by the fact that the ornament throughout was the work of an Italian artist named Cipriani, and this may also be the reason for the variations in details which the building presents when compared with the plates in the Five Orders. Since 1876 the building has been in the hands of the trustees of the O'Brien Institute close by. Frederick H. Jermyn.

[The original drawings from which our illustration is taken were shown at this year's Exhibition of the Royal Hibernian Academy in Dublin.]

TUNSTALL HIGH STREET SCHOOLS.

The schools here illustrated occupy a most central and convenient position. The site contains 3,674 square yards, having a good frontage to the High-street, and surrounded by Woodland-street, Garden-street, and Wood-street, the cost of which has been £2,500. The school buildings will be of two stories, and will give accommodation on the ground floor for 330 infants, and on the upper floor for 460 boys and girls, to be worked for the present as a mixed department. The accepted tender is that of Messrs. Yorke and Goodwin, of Tunstall, for £6,690. The principal frontage is to High-street, is two stories in height, and has a commanding appearance, being faced with red pressed bricks and terracotta dressings. A tile roof and a handsome ventilating turret complete the design. The classroom principle is adopted; but by means of glazed sliding partitions, two or more rooms can be thrown together. The upper floor will be of fireproof construction, also the staircases. The rooms are admirably lighted and ventilated, lofty, and well proportioned. Ample cloakrooms and lavatory accommodation and teachers' rooms are provided to each department. The entire building will be heated with hot water, and supplemented by open fireplaces. The interior walls will have glazed tiled dadoes and plastered above, and all the woodwork will be stained and varnished. Covered playgrounds are provided under a portion of the main building, and also good open playgrounds with asphalted surface, and the usual latrine blocks are arranged for. A convenient caretaker's house adjoins Woodland-street. The architect is Mr. A. R. Wood, of Tunstall, the architect to the Wolstanton School Board.

CHURCH OF ST. LAWRENCE, BARTON, NEAR PRESTON.

This church, now in course of erection, replaces an older one which has been found inadequate and unsuitable for the needs of the parish. The corner stone was laid last April by the Right Hon. Viscount Cross, G.C.B. The plan consists of nave, north and south aisles, chancel, side chapel, and vestries, &c. The main entrance is at the south-west angle through a tower arranged as a porch, and surmounted by a spire, the total height being 94ft. Another entrance is provided for the vestries. The main walling is in Yorkshire parpoints, backed with brickwork, and relieved by red stone dressings from Runcorn quarries. The roofs are to be slated with Buttermere green slates. The inside woodwork generally will be pitch-pine unvarnished, the principal fittings being in oak. The walls are finished in plaster. The total accommodation provided is 336, with space for additional seats when required, and the cost, including the spire, about £5,000, in which amount is included a bequest of £2,500 by the late Mr. C. R. Jacson and another £2,000 by the late Miss Cross. Mr. T. Croft, of Preston, has the general contract, the joiner's work being carried out by Messrs. Hatch, of Lancaster. Mr. R. Knill Freeman, F.R.I.B.A., of Bolton and Manchester, is the architect.

CHIPS.

New schools for Holy Trinity parish, Darlington, are in course of erection in Greenbank-road, in that town. The cost will be £2,500, and Mr. G. Gordon Hoskins, of Darlington, is the architect.

Subscriptions are being raised now for the scouring and preservation of the White Horse at Kilburn, near Coxwold, in the Vale of Mowbray, below the North Yorkshire moors, a well-known landmark to railway travellers between York and Darlington, which by neglect has become in places almost obliterated.

Good progress is being made with the new iron pier at Bangor, the sheet-iron of the structure now extending to a length of 1,285ft. The bridge and pontoons are in course of construction, and arrangements are progressing in connection with the proposed dredging operations, which are expected to cost £1,200. Mr. J. J. Webster is the engineer.

On Wednesday week the Vicar Apostolic of Wales (Dr. Mostyn) visited Pantasaph to open a new wing which has been added to the orphanage portion of St. Clare's Convent, at a cost of about £3,000. The building, which will afford accommodation for 100 orphans, has been erected by Mr. William Healey, contractor, Salford, from plans prepared by Mr. E. Kirby, of Liverpool. The new wing practically completes the original design for the whole range of buildings.

At the meeting of the Dover Corporation on Wednesday week, the question of introducing a system of electric tramways into the town, over an area of between three and four miles, was considered, and it was decided to apply for Parliamentary powers to carry out the proposal forthwith. The cost of the scheme was roughly estimated at £50,000, which sum will include the construction of a generating station.

On Saturday morning the dead body of Mr. John Edward Moseley, architect, Clara-street, Huddersfield, was found floating in the canal at Huddersfield. The deceased, who was 73 years of age, was last seen alive at nine o'clock on Friday evening. At the inquest, held on Tuesday, the jury returned an open verdict.

An impetus is about to be given to the construction of the new Opéra Comique at Paris. M. Poincaré, Minister of Fine Arts, has made an investigation into the causes of the much criticised delay. This is now attributed to the negligence or the apathy of a contractor, who, for some reason or other, seemed inclined to procrastinate. He is accordingly to be called upon for explanations by the Building Board. Should his defence be deemed satisfactory, he will be directed to get the work done by a certain date, and to make up for lost time. In the contrary event, his contract will be cancelled, and his place will be taken by a more energetic person.

The Duchess of Westminster laid on Tuesday the foundation stone of a new national school for girls at Wrexham. The new building adjoins the existing national schools for boys and infants at Madeira Hill, and will cost over £4,000.

FROM THE CLUNY MUSEUM.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

The Society of Architects.—The annual general meeting of the society will be held at St. James's Hall, Piccadilly, on Tuesday week, the 29th inst., at 8 p.m., when the election of officers and council for the year 1895-96 will be proceeded with.

Association of Sanitary Inspectors.—The annual general meeting of the members of the Sanitary Inspectors' Association was held on Saturday night at Carpenters' Hall, E.C., Mr. Henry Thomas, of Bermondsey, in the chair. From the annual report, it appeared that the membership of the association was now 292, as compared with 216 last year. Sixty new applications for membership had been received at that meeting, and there was a prospect of an additional hundred at an early date. Reference was also made in the report to recent deputations to the Local Government Board on the questions of security of tenure of office for sanitary inspectors and the operation of the Food and Drugs Act, and it was stated that the association intended to still further pursue their representations. Respecting the proposal of the Hackney Vestry to appoint six sanitary inspectors at a salary of £91 each per annum, it was stated that, as a result of representation made to the Local Government Board by the council of that association, that body had refused to sanction the appointments at such a meagre salary. Mr. H. Thomas was elected chairman of the council.

Birmingham Architectural Association.—On Thursday night in last week a conversazione was held in the galleries of the Royal Society of Artists, by permission of the committee. The president, Mr. William Henman, received about 150 guests, and presented to the following gentlemen the prizes they had obtained in the various classes during the past session:—Construction class, W. J. Pritchard. Sketching class: first prize, Mr. A. McKewan; second, Mr. H. Norman. Vacation sketches and measured drawings made on the visit to Shropshire: first prize, Mr. E. F. Reynolds; second, Mr. A. E. McKewan. History lectures: first prize, Mr. E. F. Reynolds; second, Mr. H. Guest. Class of design: first prize, Mr. J. A. Swan; second, Mr. H. E. McKewan. The two latter were conducted by Mr. Arnold Bidlake, in conjunction with the Municipal School of Art. Mr. Oscar Pollack undertook the musical portion of the evening's entertainment, and was assisted by Madame Pollack, Masters Martyn, Monte, and Maurice Pollack, Misses Louie Myers and Emilie A. Turner, and Messrs. F. S. Howl, Samuel Evans, Walter Vaughan, and Percy Stranders. Besides the pictures on the walls, there was a large collection of students' works and drawings, lent by London and Birmingham architects.

Glasgow Architectural Association.—The new rooms of the Glasgow Architectural Association at 187, Pitt-street, were formally opened on Saturday afternoon, when there was a large attendance of the members and their friends. Mr. A. N. Paterson, M.A., presided, and briefly welcomed the guests. A programme of music was submitted, and the visitors had an opportunity of inspecting a select little arts and crafts exhibition which was laid out in the premises. A partner in the tenancy of the rooms is the Architectural Institute of Glasgow.

Glasgow Institute of Architects.—The annual meeting of the members of the Glasgow Institute of Architects was held on Tuesday in the new rooms, 187, Pitt-street, Mr. T. L. Watson, president, in the chair. Mr. C. J. Maclean, secretary, read the annual report of the council on the affairs of the Institute. It stated that the past session had been one of great prosperity. For many years the membership had steadily increased; but this year no fewer than eight new members had been admitted. There were now on the roll 60 ordinary and 10 honorary members. The finances were in a very satisfactory position. The chairman, in moving the adoption of the report, said they had seen a wonderful revival in some of the arts connected with architecture, such as glass-painting or stained glass. Other arts, less important, it might be, but still valuable, had become almost extinct within the last hundred years. They had no workers in lead such as they had in past times. Up till early in the present century the worker in lead was an artist; now he was a registered plumber. With all possible respect for registered plumbers, and the useful and excellent work they did, he suggested that an exhibition of old artistic lead-work, if such could be got together, would be something of a revelation to lead-workers and to many other trades. Again, would anyone assert that ironfounders generally know anything of cast-iron design? He believed that small and carefully selected exhibitions would have a highly educative influence both on architects and their collaborators in the work of construction and decoration. The report was adopted.

CHIPS.

The ancient abbey church of Llanthony, Monmouthshire, has been reopened after a thorough restoration of the nave under the direction of Mr. J. J. Spencer, architect, of Abergavenny.

Archdeacon Brooke, of Halifax, opened a new Sunday-school for St. Andrew's, Bruntcliffe, on Friday afternoon. The building is in the Gothic style, and the cost, inclusive of the erection of boundary walls, is about £2,000.

At Hedley, Surrey, the east window of the parish church has recently been enlarged, and new stained glass inserted, from designs by Messrs. Burlison and Grylls, in memory of the late Mr. and Mrs. George Lyall, of Hedley Park. The architect was Mr. Henry Rose, of Staple Inn, Holborn, who also designed a triptych containing paintings representing the Entombment of Christ, the Supper at Emmaus, and the Appearance to St. Mary Magdalene in the garden. The churchyard of this parish has also been improved by the erection of three covered gates, including a lych-gate.

The contract for the reconstruction of the building in the Haymarket, at Newcastle-on-Tyne, hitherto known as the People's Palace, amounting to £4,600, has been let to Mr. Alexander Pringle, of Gateshead, and will be carried out according to plans prepared by Mr. J. W. Taylor, architect, Westgate-road, Newcastle-on-Tyne. Operations will be commenced forthwith. It is intended to gut the building, and to remodel the auditorium on modern lines.

After a discussion extending over nearly six hours, the Leeds City Council decided on Tuesday, by 29 votes to 24, to adopt the overhead system of electric haulage for the tramways throughout the city. Horse and steam haulage were both condemned as unsuitable for the city, and most of the opposition came from those who thought the cable system preferable. It was contended by the supporters of electricity that the cable system would cost £428,922 to introduce into Leeds; and the annual outlay is estimated at £101,819; whereas the capital outlay on the electric system will be only £378,499, and the working expenses £90,072 per annum. In mechanical efficiency, the balance of argument was also apparently in favour of the electric system.

The ancient bone crypt of the Church of St. Bartholomew the Great, West Smithfield, which was opened as a mortuary chapel last June, has been visited by large numbers of people. The Lady-chapel above is still in an unfinished condition, the restoration, which was being carried out under the direction of Mr. Aston Webb, being entirely suspended for want of funds. The whole church, including the crypt, Lady-chapel, museum, and south triforium, will be open for free inspection on Saturday in next week, October 26th, at 2.30, when the history and architecture of the church will be explained.

At a meeting, on Wednesday, of the Inverness County Road Board, the question raised by the operators of the British Aluminium Company as to the alteration of the roads and the raising of the levels of three lochs in the Foyers district was again discussed. The objections to the scheme which dealt with the alleged destruction of the Falls of Foyers were alleged to be greatly exaggerated, and the board unanimously agreed to approve of the alterations and works proposed.

At a general assembly of the Royal Society of British Artists, held on Tuesday, the following artists were elected members from a list of 155 candidates—viz.: Messrs. Abbey Alston, F. A. W. J. Armstrong, J. H. Bentley, J. Ernest Breun, Victor Burnand, C. E. Clifford, E. G. Fuller, Carleton Grant, George Harcourt, Arnold Helcke, Hal Hurst, Gemel Hutchison, Neils M. Lund, A. Meade, Herbert A. Olivier, E. A. Fellowes-Prynne, Reginald Smith, J. F. Sullivan, A. Tucker, and W. J. Warrener. The exhibition of members' works, which will open on the 28th inst., will contain a series of studies by Sir Frederic Leighton, made during his visit to Algeria this year.

Colonel W. Langton Coke, M.I.C.E., inspector from the Local Government Board, held an inquiry on Wednesday at the board-room of the Soothill Upper Urban Council relative to an application for sanction to borrow £2,134 and £612 respectively for the improvement of Rouse Mill-road and Bradford-road, and the widening of High-street. There was no opposition.

Engineering Notes.

Preston and the Ribble Works.—Reports on the improvement of the Ribble navigation works have been issued to the members of the Preston Town Council. Sir G. S. Nares (chairman of the Ribble Commissioners), Mr. W. H. Wheeler, M.Inst.C.E., and Mr. Fowler, Ribble engineer, have been taking surveys of the channel for some months, and their opinions are embodied in lengthy reports. It is suggested that the training-walls be extended two or three miles below Lytham, and that suction dredging be commenced. The cost is estimated by Mr. Fowler at £39,450, to be expended as follows:—Training walls, £11,000; light beacons, £1,250; dredging, £18,000; three additional sand-pumps and distributors for four barges, £5,600; contingencies, £3,600; total, £39,450. The expenditure of this sum is expected to permit ocean-going vessels of 15ft. draught getting up to the dock every day, instead of five days in a fortnight, as at present. Sir George Nares advises an ample margin for any extra walling required. The Ribble committee also propose to increase the warehouse accommodation, and construct a timber pond and graving dock. The total sum expended on the Ribble to date is £1,123,745, of which £93,575 has been repaid out of the rates. The revenue last year from the river was £15,233, as against £13,373 the previous year.

The new workhouse infirmary, Mildenhall, is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Brighton race-stand trustees have completed the whole purchase of Brighton racecourse, costing £25,000, and presented it to the town.

The western section of the Siberian Railway has now been completed as far as the River Ob. The continuation of this section as far as Krasnoyarsk will be opened this year.

The House Committee of the Morley House Convalescent Home visited the Home at St. Margaret's Bay, Dover, on Saturday, and held a meeting to consider the advisability of replacing the old building with a new and more commodious structure. Mr. G. D. Stevenson, hon. architect, submitted plans, and stated that the cost of rebuilding would be about £3,000. It was resolved to endeavour to raise this amount in order that the new wing might be in readiness to receive patients next spring.

The churchwardens of the parish church of Burton-on-Trent, with the contractors for the work which has been recently carried out there, entertained the workmen engaged on the job at dinner at the Star Hotel, High-street, on Saturday night. The chair and vice-chair were occupied by Mr. White (clerks of works) and Mr. T. W. Turner (son of one of the contractors).

The Financial Commissioners of the Paris International Exhibition in 1900 have prepared a scheme for raising the necessary funds, which will be submitted to the Chamber on the reopening. The expenses are to be provided by an issue of three million two hundred and fifty thousand lottery bonds of twenty francs each, which should provide sixty millions out of the hundred millions the Exhibition is expected to cost, the bonds to be issued, at latest, at the beginning of next year.

The Rochester Town Council have decided to have the south-western turret of the Castle repaired. The north turret has already been restored. Other work found to be necessary for the preservation of this historical relic will be undertaken. Mr. George Payne, F.S.A., secretary to the Kent Archæological Society, is superintending the operations.

An electric-light installation, carried out by the corporation, was inaugurated at Tunbridge Wells last week. The works have been executed under the direction of Mr. H. L. P. Boot, borough electrician, in accordance with a report prepared by Mr. W. H. Preece, C.B., and the outlay has been about £25,000. The buildings, which adjoin the South-Eastern Goods Station, have been erected from designs by Mr. A. Ardon, F.R.I.B.A., of Westminster.

A three days' bazaar, under the auspices of the Hawick Archæological Society, was held in the Exchange Hall, Hawick, at the close of last week, and was opened by her Grace the Duchess of Buccleuch. The object of the bazaar was to provide a small endowment to insure the efficient carrying on of the society's work, the classification and increase of the museum's treasures, and the appointment of a curator. The hall was illustrative of Old Paris. Of the £600 aimed at, £570 was raised by the end of the week.

Building Intelligence.

Bath.—A new organ has been placed in the Abbey Church, Bath, in memory of the 20 years' rectorate of Canon Brooke. The instrument, which was formally opened on Friday, has cost about £3,000. The organ, which has been built by Messrs. Norman Bros. and Beard, of Norwich and London, consists of four manuals and pedal organ and 52 sounding stops. It stands in the north and south arches under the tower, the pedal organ occupying both sides of the north transept, each side having a depth of 3ft. 6in., with the lower notes of the 32 and 16ft. open diapasons forming a front to each, the lower portions being covered in to a height of 6ft. with panelled oak screens, and containing four wind-reservoirs on different pressures for supplying the various stops and pneumatics. The length of tubing between the console and pedal organ is 70ft. The portion under the north arch of the tower contains the swell and choir organs, the pedal open diapason (metal) forming the front. The swell organ is divided into two portions, occupying the sides behind the longest front pipes, the choir organ being placed between them. There are also four reservoirs of various pressures placed immediately below the soundboards. The swell-box has four sets of shutters, which are governed pneumatically from the console. The connections between the north division and console are 60ft. in length. The small front facing north is composed of the bases of the choir organ diapasons. The division under the south arch of the tower contains the great and solo organs, the front pipes being composed of great organ diapasons, and the small front facing south of solo bases. There are five reservoirs of different pressures placed under the soundboards of this division. Part of the solo stops are inclosed in a separate swell-box, the shutters of which are governed pneumatically. The connections to console are 90ft. in length. The wind pressures vary from 4in. to 14in., and are supplied from two large mains, which are charged from nine square feeders worked by a 4H.P. "Otto" gas-engine, placed in a vault outside the south wall of the abbey, at a distance of 120ft. from the organ, the wind being conveyed by means of large zinc tubes, placed under the floor of the transepts. The supplies in the various organs are governed automatically from the large mains. The action is tubular pneumatic throughout. All stops are of complete compass. Some of the old stops from the original organ have been worked in, the scales being increased and the whole revoiced. The console is arranged so as to bring everything under easy control. The jambs are placed at an angle of 45°, and are of ebony, with ivory knobs and bushings, the casework being of oak. The player is raised 2ft. above the floor level.

Clydebank, N.B.—The new Union Church was opened on Thursday, the 10th inst. It occupies a site almost directly opposite the old church, which has been demolished by the railway operations. The style is Late Decorated. The church is built in Locharbriggs sandstone, with light green slated roof. The main front faces Dumbarton-road, and the central gable here rises to a height of over 60ft., flanked on each side by octagonal staircase turrets containing openwork stone tracery in the upper story, and terminating in steep red-tiled roofs, each over 70ft. high. Over each side of the main doorway are winged angel figures projecting from the wall, and carrying the base of moulded shafts which run up the height of the gable, and terminate in crocketed pinnacles. The side elevations are divided into four bays each, the lower stage with three-light cusped windows, and the upper with a series of four-light traceried windows, all of varied design, placed between broad, plain piers of masonry. The organ-chamber is continued beyond the main building, in chancel form, and the hall buildings form a lower group to the west of the main front. Internally the church is divided into nave and side aisles by massive moulded stone arches of wide span, resting on stone piers, one on each side. The pulpit gable is pierced by a triple arch, carried on clustered columns, with carved caps, the pulpit being placed in front of the central arch, the choir behind, the two side arches arranged for organ-chambers. The ceiling is lofty, and the roof of massive construction, the whole main timbers exposed, and the ceilings in wood panelling. There are side and end galleries, carried on beams behind the columns. The gallery fronts and the pulpit are of oak. The total number of sittings is 850, and there are also a hall seating 350, two large class-rooms, session-house, vestry, ladies'-room, kitchen, cloak-rooms, &c. The cost is about £7,000. The architect is Mr. John B. Wilson, A.R.I.B.A., Glasgow, whose design was selected by the assessor from those invited in competition, and the work has been executed by the following contractors:—Mason, D. Winton, Duntocher; wright, Geo. Ferguson, Glasgow; slater, Latto and Son, Clydebank; plasterer, J. M'Donald and Son, Kirkintilloch; plumber, Stalker and Dave; glazier, L. Adam and Co.; and carving, Dawson and Sheriff.

King's Langley.—The parish church, a fine example of Perpendicular work, was reopened last week after restoration. It consists of nave, aisles, chancel, with north and south chantry chapels, and western tower. There are several brasses in the church, the oldest being dated 1528, and there are also a couple of Mediæval altar tombs to the memory of Edmund de Langley and Sir John Verney, besides one of later date, and some mural tablets. The church was partially restored in 1878, the work including a new reredos, and the extension of the north chantry further eastward, to form a chapel for the reception of Edmund de Langley's monument, then removed from the north side of the sacrarium. The present reopening marks a further enlargement and restoration. The south chantry of the choir has been extended eastward to form a choir vestry, and the organ has been taken down and removed from the tower to a position adjoining. A new oak case has been added to the instrument by Messrs. Gray and Davidson, London. The tower has been paved, its western doorway has been restored, and a panelled ceiling formed, so that it is now available for seating. The garish east window has been replaced with fresh glass, the old glass being reserved to be altered and refixed elsewhere in the church. New oak choir stalls and clergy stalls are to be found in the chancel. A brass lectern has been supplied by Messrs. Jones and Willis, of Birmingham. The general restoration and enlargement has been carried out by Mr. Miskin, builder, of St. Alban's, under the direction of the architect, Mr. Gordon P. G. Hills, A R.I.B.A.

Lisburn.—For months past the Town Commissioners of Lisburn have been engaged in improving the public markets which they have lately acquired, and which had become dilapidated. The butter and egg markets have been renovated. The grain market is also undergoing a like transformation. There will be an inclosed shed for storage 147ft. long and 32ft. wide, and an open shed (for grass-seed) supported on iron columns 172ft. in length by 16ft. From the centre of the columns to the wall there will be a raised platform level with the floors of the shed. Appliances will be provided for weighing. The floors of the sheds will be of granolithic, and the whole extent of the market will be made up of passage and carriage ways. The front next Market Place will be inclosed with an iron railing. The market will be completed on the 1st of March next. The architect is Mr. James Johnston, C.E ; the contractor Mr. John Vernon, and the clerk of works Mr. William M'Dowell.

London County Council.—At Tuesday's meeting of the council, a scheme for improving the Churchway area in Somers Town, was approved, and the resolution declaring the area to be an insanitary one was agreed to. The scheme deals with the houses in Churchway, Wellesley-street, Elizabeth-court and York-buildings, and provides for the formation of a 40ft. road along the existing line of Churchway, widening on its western side from Grafton-place to Drummond-street, and thereby converting three *culs-de-sac*—viz., Grafton-place, Wellesley-street, and Lancing-street, into thoroughfares. The total net cost of the scheme is £51,650, and by the co-operation of Lady Henry Somerset a saving will be effected of £12,500, reducing the total cost of the scheme to the Council to £39,150 net. The total number of persons who will be displaced is 1,086, and accommodation for about 568 can be provided on the cleared area. It was agreed without discussion to contribute £44,960, one-half of the cost, towards the widening of Ludgate-hill. The scheme for the improvement of the area north of the Strand adjoining Clare-market at a net cost of £216,000, described in detail in our last issue, p. 542, was approved after some discussion, and the resolution declaring the area unhealthy agreed to. A recommendation was submitted by the Parliamentary Committee, in reference to the eight Water Bills promoted by the Council in the last session of Parliament, that the Council invite the Government either to deal with the question of water supply themselves or to appoint a Royal Commission. Mr. Stuart, M.P., moved as an amendment that the bills for the purchase of the undertakings of the London water companies be proceeded with. After a debate the amendment was rejected by 54 to 53 votes. The debate was then adjourned.

Manchester. — The Grand Committee of Trustees of the Manchester Royal Infirmary appointed to consider the extension of the building met on Monday to receive the report of a sub-committee, and also the report of a minority of such sub-committee, upon the matters referred to them. A resolution was passed requesting the signatories to the majority report "to obtain full plans and elevations on which they propose the hospital shall be rebuilt on the present site, and also to obtain evidence from experts in hospital buildings and others as to the practicability and efficiency of such plans, and an approximate estimate of their cost." A further sub-committee was appointed to obtain the opinion of experts and others as to the building of a new supplementary hospital elsewhere, to provide for the additional accommodation required, to obtain plans and an approximate estimate of the cost of such hospital, and also to report as to what alterations in the present building would be necessary to bring it up to date and to make it as efficient as possible according to modern ideas. The signatories to the minority report were asked to give full details of their scheme, and were also empowered to order plans to be prepared and to call in experts.

Marsden.—A new church was consecrated at Marsden, on Saturday, by the Bishop of Wakefield. Thirty years ago foundations were laid for the church; but after they had been brought to the level of the ground, unfortunate circumstances arose which put a stop to the work. The difficulties have now been removed, and a building has been erected upon the foundations laid so long ago. The church is designed in the English type of 14th-century Gothic, and the portion now completed consists of a lofty nave, 92ft. long by 24ft. wide, in six bays, with open-timbered roof. A temporary chancel has been formed. A stone pulpit, executed by Mr. George Milburn, of York, has been presented as a memorial. The design includes a western tower, but this will not be carried out at present. The church will now seat 600, and when fully completed 800. The architects are Messrs. C. Hodgson Fowler, of Durham, and John Kirk and Sons, of Huddersfield, and the work has been carried out by local contractors. The cost has been about £7,800.

Morley.—The new town-hall at Morley, near Leeds, was formally opened by the Right Hon. Henry Asquith, M.P., on Wednesday. The building is Classic in style, and the stone used in construction has been obtained from the local quarries. The main front has a projecting portico carried by Corinthian columns, and approached by a flight of steps; behind this is a lofty and massive clock-tower, with domical roof, rising to a height of 150ft. The site on which it has been erected, from the designs of Messrs. Holtom and Fox, of Dewsbury, is between Albion-street and Wellington-street, the dimensions of the building being 140ft. by 146ft. To the left of main entrance are the offices of the town clerk and the borough accountant, and to the right those of the borough surveyor and the inspector of nuisances. Along the north corridor is the borough court, and adjoining are rooms for the magistrates, for their clerk, and for solicitors and witnesses, and also magistrates' clerk's office. The town-hall proper is 90ft. by 46ft., and 36ft. high. At the northern end there is an orchestra extending across the room; at the opposite end a large gallery, with a balcony on each side, has been erected, giving in all accommodation for 1,200 persons. The floor is to be seated with chairs, and the gallery with upholstered tip-up seats. At the south end there is a banqueting or reception room, with a small room attached. At the opposite angle are the council-chamber, councillors' ante-room and retiring-room, mayor's parlour, waiting-room, and tea-room. The police offices and cells are on the ground floor. Underneath a portion of the large hall there is a smaller hall to accommodate 600 persons. The large kitchen is connected by lifts with the banqueting and other halls. The large rooms will be heated by means of hot-water pipes, and the offices by open fireplaces. Portions of the flooring are coloured blue, and the remainder pink, in encaustic tiles or mosaic, while all the staircases are fireproof, with stone steps, wood handrails, and iron balustrades. The doors are panelled and moulded, and the windows have moulded fixed sashes, with circular heads. The total cost has been £36,000. Mr. Henry Clarke has been the clerk of works, and the work has been carried out by local contractors, the chief being those for masonry, taken by Messrs. Schofield, Sons, and Co., of Leeds; and joinery, Messrs. James Clegg and Co.

Newcastle-on-Tyne.—The Stephenson Free Library in Elswick-road, Newcastle, was inaugurated by the Home Secretary a short time since. The building, which is 85ft. by 43ft., comprises two floors. On the ground floor there is a refreshment-room, committee-room, ladies' reading-room, general reading-room, and lavatory. On the upper floor is the large hall to serve as the library and for meetings. It is 70ft. by 36ft., with platform and retiring-room. On this floor are also a smaller committee-room and janitor's room. There is a second staircase adjoining the platform. Externally, the walls are faced with red Leicestershire bricks, with dressings of stone and pink terracotta, and the roof is covered with red Ruabon tiles. The internal woodwork is stained canary wood, except the roof of the large hall, which is of hammer-beam construction in pitch-pine, the ceiling being panelled with moulded ribs. The staircases are in pitch-pine. The whole of the windows have lead glazing in clear glass, except the staircase, which has a stained-glass window. The west entrance is carried up to form a low tower, having a steep, tiled, pyramidal roof rising behind the parapet. There are three gablets on each of the north and south fronts. A special system of ventilation has been carried out, the vitiated air being carried off in flues all over the building, and discharged through a turret at the south-west angle. The heating is by radiators on a low-pressure steam system, and electric light is installed throughout the building. The general contractor has been Mr. Walter Scott; the roof tiling is by Messrs. Beck and Sons; the plumbing by Messrs. Bland Bros.; the painting and staining by Mr. John Gibson; the heating by Messrs. Emley and Sons, Ltd.; the iron casements for windows by Messrs. Ashwell and Nesbit; the lead glazing by Mr. G. J. Baguley; the door and other fittings by Mr. N. F. Ramsey; the carving by Mr. Howson; and the electric lighting by Messrs. R. J. Charleton and Co. The work has been carried out from the designs and under the superintendence of Mr. John W. Dyson, architect, of Newcastle, at a cost of £4,000.

New Mar Lodge.—The Queen visited the Duke and Duchess of Fife on Tuesday to lay the foundation-stone of the new mansion which is to take the place of Mar Lodge, recently destroyed by fire. The site of the new residence is a picturesque spot at present occupied by Old Mar Lodge, about two miles further up the valley of the Dee, and on the opposite or north bank of the river. The Lodge is to be a comparatively low building, but very extensive in range. It will consist of a centre block 118ft. in length, with two side wings, each 78ft in frontage, which project forward from the main building in a crescent or half-moon form. Round the entire mansion will be erected a verandah. The Lodge will be built of granite quarried in the neighbourhood, and a large portion of the timber will also be taken from the adjoining forests. The granite is of a warm pink colour, and the roof will be covered with English-made red tiles. The style will be Old English, having a good deal of woodwork in the exterior about the gables and verandahs. A large number of bedrooms are provided, besides numerous public rooms. The kitchen and offices will form a separate pavilion from the main house, and the latter is so arranged that all the bedrooms and public rooms will have a southern exposure. New stabling and a thorough system of water and drainage will be carried out. The architect of the new Lodge is Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen, and the outlay will be £20,000.

Northampton.—In the church of St. Matthew, built in 1893 by the family of the late Mr. Pickering Phipps, a new organ and new reredos, altar rails, and screens were dedicated on Friday by the Bishop of Peterborough. The organ, a four-manual instrument, has been built by Messrs. J. W. Walker and Sons, of Francis-street, Tottenham Court-road. It is situated in a chamber on the south side of the chancel some 40ft. in height, and opens both to the south transept and to the chancel by a series of eight arches. The new reredos is composed wholly of polished alabaster, sunk, carved, and moulded, and has been carried out from designs by Mr. M. H. Holding, A.R.I.B.A. (the architect of the church). The general composition comprises in the central compartment the Crucifixion, with St. Mary and St. John and attendant angels; and the smaller compartments and niches are filled with statues in white alabaster of saints and martyrs chosen from all ages since the times of the Apostles. Mr. Robert Davison, of Marylebone-road, London, executed the whole of the structural work, and Mr. Nathaniel Hitch, also of London, executed all the sculptured work. The sanctuary is fitted with a panelled and traceried credence table in wainscot oak. This is the work of Mr. Henry Martin, the builder of the church. Two standard lights, six smaller sanctuary lights, and a processional cross have been made by Messrs. Barkintin and Krall, of Regent-street, W. All the additions have been executed, either from designs by, or under the direction of, Mr. M. H. Holding, and the structural additions were carried out by Mr. Martin.

Northampton Master Builders' Association.—The annual dinner of the Northampton Master Builders' Association was held in the old reading-room, town hall, in that borough, on Thursday in last week, about 110 sitting down to the repast. The chairman of the association (Mr. R. Cosford) presided, Mr. G. J. Fisher occupying the vice-chair. Supporting the chairman there were the Mayor (Councillor W. Tomes), who wore his chain of office, Mr. H. Martin, J.P., Mr. G. Norman, J.P., Mr. E. Law, Mr. W. Norman, Mr. W. I. Brown (borough surveyor), Mr. W. D. Gibbins (borough engineer), Mr. F. H. Harris, Mr. C. Smith, Mr. R. S. Skillington, and Mr. F. G. Airs (secretary). Mr. J. B. Clarke gave the "Mayor, Magistrates, and Members of the Corporation," which was acknowledged by the Mayor, who is a member of the association, and by Messrs. Norman and Martin, magistrates. Mr. H. Green proposed "The Architects," and Mr. E. F. Law responded. Messrs. J. T. Ingman, Stevenson, Shaw, Piccaver, and Harris also replied. "Success to the Northampton Builders' Association" was submitted by R. S. Skillington, who thought the society had fully justified its existence. The toast was drunk with musical honours, and the chairman, in replying, remarked that the association was formed some 19 years ago for the purpose of settling disputes in the trade, and so far it had been most successful, as during the last 12 months they had not had a single dispute. Mr. A. J. Chown gave the "Town and Trade of Northampton," coupled with the name of Mr. T. L. Wright. Other toasts were "The Chairman," "The Vice-Chairman," and "The Secretary."

Scarborough.—The new Liberal Club at Scarborough is to be opened by Lord Rosebery to-day (Friday). The front entrance opens into the vestibule, which leads direct to the hall, from whence is reached the reading-room, a very spacious apartment, about 32ft. square, and well appointed. The billiard-room is 74ft. long by 27ft. wide, and contains three billiard-tables. It is provided with a raised platform and excellent lounge-seating throughout. This is also entered direct from the hall, as also is the game-room adjoining, which is about 27ft. long by 17ft. wide. The council-room, about 58ft. long by 32ft. wide, is on the first floor, and has an open-timbered roof. Immediately adjoining are the game-rooms and committee-rooms, which, by an arrangement of the North of England Furnishing Company's patent folding-shutters, can be thrown open and added to the council-room, making the whole well adapted for the social gatherings of the club. On the first-floor is also provided apartments for the Women's Liberal Union. The building is provided with caretaker's rooms. The electric light is installed throughout, by Messrs. Pym and Co. The heating, on the low-pressure system, is applied to every room, as well as to the shops in front. This is the work of Messrs. Newton, Chambers, and Co., of Sheffield. The contractors are all local men. Brick, &c., Messrs. Petch and Fox; carpenter, Mr. Geo. Scales; plumber, Mr. David Maynard; smith, Mr. A. J. Lowe; slater, Mr. John Hardgrave; painter, Mr. Thomas Fidler. Leaded lights and iron casements have been carried out to the architect's design by Messrs. Talbot and Co., of Leeds. The building, with the site, cost about £11,500, and has been erected under the direct supervision of Mr. John Hall, the architect; Mr. J. Soul acting as his clerk of the works. A library is being fitted up in the reading-room at the cost of Mr. J. Compton Rickett, the borough member, and will contain several hundred volumes.

St. John's Wood, N.W.—Mr. William Pollitt, general manager of the Manchester, Sheffield, and Lincolnshire Railway, laid, on Monday, the foundation-stone of the artisans' dwellings which the company are erecting in connection with their extension to London. The buildings, which are at the junction of Grove-road and St. John's Wood-road, will occupy an area of four and a half acres, and will accommodate 2,690 persons, there being 540 sets of rooms in the six blocks, the tenements being arranged in sets of 325 two, 165 three, and 50 four-room holdings. Mr. A. R. Stenning is the architect, and Mr. J. T. Firbank, M.P., the contractor. Mr. Pollitt, on formally declaring the stone laid, said it was 30 years since a new railway had been brought into London, but he was certain it would tax the ingenuity of the greatest engineers and surveyors to find means of getting another into London on the north side of the city. It was owing to the compulsory powers of Parliament that they had erected those dwellings, as about 3,000 of the working population had been displaced owing to the new line. The total cost of the buildings was something like £250,000, but he believed with careful management there would be a fair and reasonable return on the outlay.

Stratford, E.—The foundation-stone of a church for St. Matthew's Park district was laid on a site at the corner of Dysot-road the other day. The building will be erected by Mr. S. C. Parmenter, of Braintree, and Mr. E. P. Loftus Brock, F.S.A., is the architect. The church will be in the Gothic style of the middle of the 13th century, with walls faced with flint, and with windows filled with Geometrical tracery of Bath stone. It will consist of a nave, with north and south aisles, chancel, double transepts on each side, organ-chamber, and choir and clergy vestries. The roofs will be of open timber, each aisle, as well as the nave, transepts, and chancel, having its separate gable and ridge. An octagonal turret will be erected over the chancel arch of considerable height. The nave will be divided from the aisles by columns and arches of timber, instead of the ordinary system of stone. By this means an unusual degree of lightness will be given to the interior, which will be practically free from obstructions to view. The windows will be filled in with cathedral glass of varying tints, and the passages will be laid with tiles. All the seats will be open benches.

Swanage.—A cottage hospital has just been built at Swanage as a family monument of the late Mr. George Burt, a native of the town, the head of the well-known firm of contractors in Pimlico, and Sheriff of London and Middlesex in 1879. The hospital was designed by Mr. W. J. Fletcher, of Wimborne. On the ground floor there are two large wards, each holding six beds; an accident ward, sitting-room, matron and nurses' room, surgery, bathroom, and the usual domestic offices. On the first floor is a room which can be utilised for paying patients, or as a children's ward. It also contains bedrooms for the staff. The main feature of the building is a central hall, in which is a Gothic ingle-nook composed of Derbyshire limestone with a memorial brass, and bas-relief medallions in statuary marble, by Mr. C. H. Mahey (of Westminster), of the late Mr. and Mrs. Burt. In addition to this there is a stained-glass window, representing Faith, Hope, and Charity. The work of construction has been superintended by Mr. Cooper, the foreman of the Durlston Park Estate. The ingle-nook has been executed in London by Messrs. John Mowlem and Co. The walls have been tiled in dadoes, this having been carried out by Messrs. Minton and Co. The brass tablet, locks, and window-openers have been supplied by Messrs. Hart, Son, and Peard, of Drury-lane; the glass mosaic and stained glass by Messrs. J. Powell and Sons, of Whitefriars-street; and the hot-water apparatus by Messrs. J. Jones and Sons, of Farringdon-street, E.C.

Widnes.—St. Mary's Parish Church, Widnes, was reopened on Sunday week, after renovation.

When the church was built the contractor found the land very sandy; but an immense quantity of chemical waste was placed on the sand, and careful examination has now demonstrated the fact that the foundations are good. The building has been pointed and repaired by Mr. J. Beech. The north side of the roof has been re-slated by Mr. Henry Quinn, and the old east window has been replaced by one of cathedral glass by Messrs. Jones and Willis, of Birmingham. The work of painting and decoration was executed by Mr. J. H. Malam, of Widnes-road. The main principals of the roof have been painted in colours to give the church a lighter appearance. The walls are painted salmon colour, and has a frieze in greenish yellow, lettered in maroon with blue capitals. The voussoirs of arcades are stencilled in patterns. The chancel-ceiling is in panels, painted blue, interspersed with stars; the walls are divided into frieze filling and dado. The organ-case has been decorated, and the pews and other fittings painted.

CHIPS.

Viscount Wolseley will open the new rifle range, which the Corporation of Nottingham has provided for the 1st Notts (Robin Hood) Rifles, near Trent, on Thursday, the 7th prox.

Memorial stones have been laid of new Sunday-school premises in connection with the Wesleyan Chapel at Consett, county of Durham. The cost is estimated at £4,000.

The memorial stones of new Sunday-school premises in connection with the Central United Free Methodist Chapel, Cleckheaton, were laid on Saturday. Accommodation is to be provided for 1,000 scholars, and the contracts for the building amount to £5,684, exclusive of £1,410 paid for the site.

The Aberdeen Harbour Board confirmed on Monday the recommendation of the Works Committee that Mr. William Simpson, C.E., assistant civil engineer on the Clyde Navigation Trust, and formerly of Aberdeen, be appointed assistant harbour engineer under Mr. Nicol.

The new Natal-Transvaal Railway will be opened for goods traffic from Durban to Standerton on November 1, and for the conveyance of passengers from Durban to Johannesburg on November 15.

At a meeting of the ratepayers of the parish of St. George the Martyr, Southwark, held on Tuesday night, Mr. R. K. Causton, M.P., presiding, it was unanimously resolved to accept the offer of Mr. J. Passmore Edwards to build a free library for the district.

The urban council of Machynlleth adopted at their last meeting a scheme of water supply prepared by Mr. Kirkby, and estimated to cost in execution £4,300.

A large clock has just been erected upon the church tower at Morchard Bishop, Devonshire, which shows time on a large dial and strikes the hours. The clock has been made generally to the designs of Lord Grimthorpe by John Smith and Sons, Midland Clock Works, Derby.

The refuse of Yarmouth used to be deposited in what was known as "the muck holes" in the river Bure, but the town council have resolved to erect a destructor to consume the refuse by burning, the first cost of which is estimated at £8,000 and the annual expenditure at £500.

At Llanfair parish church, Vale of Clwyd, on Thursday in last week, a new organ was dedicated. The instrument, which has been paid for out of a fund gradually accumulated during the last 23 years, when the restoration of the church was finished, has been built by Messrs. Beale and Thynne, of London.

As a further indication of the growing importance of typewriting, it may be mentioned that the School Board for London has just placed with the Yost Typewriter Co., Ltd., a large order for Yost typewriters for instruction purposes in the evening classes. Typewriting is a popular subject both with students and teachers, and in the present case the number of typewriters requisitioned by teachers was far in excess of that which the committee in charge of the matter had power to allocate. We may add that the Yost Typewriter Co., Ltd., are removing about Oct. 7 to larger premises at 30, Holborn Viaduct, E.C.

The brass tablet to commemorate Leeds being raised to the rank of a city, to be placed in the council chamber, behind the mayoral chair, in Leeds Town Hall, has been finished. The design and execution has been intrusted to Messrs. Rothwell and Co., of Leeds and Bradford. The plate is 4ft. 4in. long, and 3ft. 4in. wide. The plate has a flowing border cut in relief, and set off on a blue ground. In other parts scarlet, black, and green are used, and the tablet is finished with brass sides instead of the usual wooden frame.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—J. C. Watkins.—One Who Knows.—N. S. J.—E. D. and Co.—F. R. (Newbury).—W. M. and Co.

Correspondence.

BUILDERS' CLERKS' INSTITUTION OF GREAT BRITAIN.

To the Editor of the Building News.

Sir,—It is now definitely determined to start this institution. It is proposed to hold a meeting at Cannon-street Hotel, at four o'clock, October 26th next; but to enable this to be done, all those intending to join please write to the undersigned at once. A full prospectus will be sent on application. The objects of the Institution will be to assist good and reliable men to obtain berths with firms in London and the provinces at fair and equitable wages, and to enjoy other benefits, which will be fully detailed in the prospectus.—I am, &c., Henry Hodling.

Acacia Villa, Queen's-road, Wimbledon.

A portrait in oils of Mr. Thomas Horn, C.E., the first statutory chairman of the Vestry of Westminster, who has resigned office after services to the parish extending over forty years, has been placed in the large council room of the Westminster Town Hall.

At the quarterly meeting of the committee of the North Wales Counties Lunatic Asylum, held on Friday at the asylum, Denbigh, it was decided to write to Messrs. Ellison and Son, Liverpool, to the effect that the Commissioners in Lunacy had approved of the plans for enlargement, and that the committee would meet them on the 29th instant.

In our notice last week, p. 538, of the reopening of St. Peter's Parish Church, St. Alban's, after rebuilding under the direction and at the sole cost of Lord Grimthorpe, we omitted to mention that the works were carried out by Messrs. Longmire and Burge, of Osnaburgh-street, N.W., Mr. Hubbard was the foreman of works, the clerk of works being the late Mr. Karbery.

Intercommunication.

QUESTIONS.

[11438.]—**Discharge of Pipe.**—How many gallons of water per diem will be discharged by a 4in. pipe 20,460ft. long, having a fall of 167ft.?—Rho.

[11439.]—**Floor for Dancing.**—Will some reader kindly give sketch or particulars describing how a floor which has the peculiar swinging or oscillating movement (for dancing) is constructed?—Presto.

REPLIES.

[11437.]—**Concrete Floor.**—(10ft. spans). If "Safety" will make his stable floor a total thickness of 7in.—viz., 5in. of coke breeze, 4 to 1, and 2in. of granite concrete, 2 to 1, with ⅜in. square rods twisted and placed 4in. c. to c., and within an inch of the bottom, he will have a floor six times the strength required for stables. The upper half of his floor will never fail him, its compressional strength is so great; and the rods not being able to slip in consequence of the twist, will more than make up for the weakness in tensional strength of the lower half. If he wishes to use steel joists, he will find 3in. by 1¼in. by 15in. c. to c. give him equally good results with half the weight as his 7in. by 2¼in. 2ft. apart. The strength necessary for stable floors is 2cwt. per superficial foot safe load.—Philip Hobbs, Newcastle-on-Tyne.

Legal.

PARISH COUNCILS AND DISQUALIFICATIONS.

THE Local Government Act, 1894, in sec. 46, sub. (*i*), provides that a person shall be disqualified from being elected or being a member of a council of a parish if he has within five years before his election made a composition or an arrangement with his creditors. In a recent case coming from the district of Tavistock (*Times*, August 8), the point was raised as to whether this clause would apply to disqualify an individual member of a firm which had made such an arrangement with its partnership creditors. The special case stated found that James Dockett, whose election was in question, had been in partnership with his brother, John Dockett, and the firm not being successful, they both executed a deed of assignment for the benefit of their joint creditors. None of the debts were owing by James Dockett separately, and he had paid the trustee for the firm's creditors a total sum of £350, which had been accepted in satisfaction of all claims against him. It was also proved, as a fact, that the intention of the parties was to assign only the partnership property, and to register the deed as only affecting the firm; and that, in other words, James Dockett was solvent, and had made no arrangement with his own creditors.

The judges, after argument, held that there was a disqualification, and on that James Dockett must be declared as not having been duly elected. Mr. Justice Day held that on the face of the deed there was an arrangement between James Dockett and all his creditors, and this came within the meaning of the statute. Mr. Justice Wright laid down the broad rule that, when a partnership makes an arrangements with its creditors, the members of that partnership also make an arrangement with their creditors under the Act. Of course, in law, each partner is legally liable for the payment of the whole of the debts of the firm, and so it is difficult to distinguish an arrangement with their creditors from one with those to whom he is only personally liable. In English law we do not yet recognise a firm as a distinct corporation separate from the partners of whom it is composed, as they do abroad, and so the argument is not so easy as it would be upon the Continent. At all events, there is now no doubt as to a partnership failure disqualifying individual members from being elected to parish councils.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

B.—Partnership.—Trade Name.—Set Off.—If the sums owing by A to F and G were on account of the business he carried on under the firm's name, then these creditors can set off those sums as against what they now owe to the firm trading under the same name, and which business A has since sold to E, especially as no notice was given of the change of owners; but A may be liable to E for the amounts.

Mr. George Batty, contractor, of Berwick-on-Tweed, will be nominated as Sheriff of that borough on November 9th.

LEGAL INTELLIGENCE.

Caution to Drain Repairers.—E. A. Wright, of 51, St. George's-square, Upton Park, was summoned at Woolwich Police-court, on Saturday, by the Plumstead Vestry, for repairing a drain in such a way as to be a nuisance. Joseph Goss, of Ramsey-road, Leytonstone, the workman who executed the repairs, was summoned for the like offence. John Rance, sanitary inspector, said he complained to Wright, the agent of the property, of the defective drain, and he promised to attend to it. Witness afterwards found that a loose pipe had been placed over a broken joint, so that both sewage and sewage gas could escape. Earth had got into the drain. The improper repairs were executed by Goss, who had since done the work properly. Mr. Kennedy dismissed the summons against Wright, and fined Goss £5 and costs, telling him it was one of the worst cases he ever heard of. If he had not been a poor man he would have fined him £10.

Charge of Conspiracy against a Sub-Contractor.—At Westminster Police-court, on Tuesday, David Atkins, sub-contractor, of Wellington Buildings, Commercial-road, Pimlico, surrendered to bail for further examination on charges of conspiring with a man named Joe Riley, not in custody, to defraud Mr. Henry Wright, builder. The accused was continuously employed from May till September on the bricklaying work of houses which the prosecutor is building at Culford-gardens, Chelsea. Prisoner was paid by the rod of brickwork, and had from 15 to 25 men at work for him. In September Mr. Wright made the discovery that though only 491,000 bricks had been used, he had been charged for the laying of 800,000—a difference of 73 rods of brickwork. The weekly payments for the work had been passed on the certificate of Riley, in the employ of the prosecutor as measuring clerk, and of him an explanation was demanded. Riley absconded, and wrote to prosecutor saying that he had betrayed his trust through drink and gambling. Atkins continued his sub-contract, paying out of his own pocket for his men for two weeks after irregularities had been found out. On his behalf it was urged there was no evidence of collusion with Riley. Evidence was given that the accused received some £300 in excess of the amount he was entitled to, and that against this was to be set off £71 worth of work done since, and not paid for by the prosecutor. The prisoner, who reserved his defence, was committed for trial to the sessions, bail in £100 as before being allowed.

The Eyre Estate Arbitration.—Lord Balfour of Burleigh opened an inquiry at the Surveyors' Institution, Westminster, on Tuesday, as arbitrator in the matter of the trustees of the Eyre Estate, St. John's Wood, and the Manchester, Sheffield, and Lincolnshire Railway, to assess the value of certain properties acquired by the railway company for the purposes of their line into London and the projected station in Marylebone, the total area being put down at 46 acres. Sir E. Clarke, for the trustees, gave an outline of the claim, which he described as the largest ever submitted to an arbitrator under the Lands Clauses Act. The estate was originally the property of the Knights of St. John of Jerusalem, and was afterwards seized by the Crown. Towards the close of the 17th century it fell into the hands of the ancestors of the present owners, the Eyre family, and he proposed to show the damage and injury inflicted upon the estate by the passage of this railway through its entire length. The trustees claim £450,000 as compensation. Sir J. Whittaker Ellis afterwards gave evidence, estimating the depreciation to property not taken at £50,047.—On Wednesday, Mr. Edward Tewson was called. He valued the properties to be taken at 20 years' purchase, and the injury to those remaining at £45,030.

In re E. Holdsworth.—A petition has been filed in the Bradford Bankruptcy Court against Edwin Holdsworth, of Storr Hill, Wyke, and carrying on business as a builder and contractor under the style of Holdsworth Bros. The liabilities are expected to amount to about £6,000, and the assets to £600 or £700. The debtor's firm were the contractors for the Cleckheaton Town Hall and the filter-beds for the Bradford Corporation at Denholme. It is stated that they lost considerably on the latter work, and to this they largely attribute their failure.

In re F. Backhouse.—A meeting of the creditors of Francis Backhouse, Goole, was held on Monday at Goole. The gross liabilities amount to £13,600, of which £3,501 is put down as fully secured; £8,246 is owing to the creditors partly secured, and £145 6s. 5d. to preferential creditors. The liabilities amount to £3,741. The assets are estimated at £856, leaving a deficiency of £2,884. The debtor attributes his failure to depreciation in the value of house and shop property at Goole, to loss on contracts, and interest on borrowed money. The Official Receiver pointed out that the bankrupt had been a speculative builder, and started at Winterton, in Lincoln, in 1869. The bankrupt had kept no books (except a day-book), and no record had been kept of his contracts. It was resolved that the debtor be adjudicated bankrupt.

WATER SUPPLY AND SANITARY MATTERS.

Arbroath, N.B.—The Arbroath Burgh Commission received on Monday a report from Mr. James Wilson, C.E., Edinburgh, on the water supply of the town. It stated that, as the result of a three months' continuous pumping night and day, the supply from the Nolt Loan Wells and from the experimental well at Warslap had diminished, the former from 171,000 to 141,000 gallons per day, and the latter from 211,000 to 130,000. The quantity from the Warslap well could not now be put above 125,000 gallons. The commission, by this test, had proved that a sufficient quantity of water could not be got from the gravel bed into which the Nolt Loan Wells and the Warslap Well had been sunk, the total supply being only 11 gallons per head per day. Mr. Wilson therefore advised the commission to abandon the pumping altogether, and give Parliamentary notices for proceeding with the gravitation scheme already recommended by him. After a discussion, the report was approved.

East London Water Supply.—Colonel Ducat, R.E., and Dr. Barry have completed their inquiry on behalf of the Local Government Board by inspecting the waterworks of the East London Company. They were accompanied by Mr. Bryan (engineer to the water company), Mr. A. R. Binnie (engineer to the London County Council), and Mr. Lovegrove (surveyor to the Hackney Vestry). The party drove first to the chief pumping-station and filter-beds in the Lea Bridge-road, where they were taken round the works by Mr. Bryan, and shown specimens of the company's fittings. They examined the method of connecting mains and service pipes in use by the company, and the means of controlling the supply through any section of pipes. They then drove to the storage reservoirs at Walthamstow, where the large new works are in progress. The East Warwick reservoir was first inspected. This is one of the new reservoirs on which the company relies to bring their storage up to 1,200,000,000 gallons. The plans were prepared immediately on obtaining the Royal assent to the Water Bill in 1894, and the contract signed with Messrs. John Aird and Sons on March 28. Within a fortnight £10,000 worth of plant was on the spot, and very rapid progress has already been made in excavating the bed of the reservoir and constructing the embankment. When completed, the area will be 40 acres, and the storage capacity about 250,000,000 gallons. From here the party proceeded to the Racecourse reservoir, the level of which is being raised about 10ft. This work is approaching completion. Finally, the inspectors visited the Hagger-lane pumping-station, near Woodford, and examined a new covered reservoir in course of construction.

Manchester Sewage.—The Mersey and Irwell joint committee have granted a further period of six months to Manchester for the completion of her sewage scheme. The city surveyor states that the amount actually paid up to the 19th ult. by the corporation was £556,540 17s. 3d. The total estimated cost of the existing works was £700,000, and, roughly speaking, there was about £100,000 worth of work in course of construction. If no difficulties were met with it would take at least twelve months to complete the work. A portion of the sewage is treated at the filter-beds at Davyhulme, and Sir H. Roscoe said the effluent was of an exceptionally good character. There is also in operation a costly plant for the chemical treatment of the sewage and for sludge pressing, and additional land has been reserved for future tank extension. At present only thirty acres are devoted to the filter-beds; but the Local Government Board has sanctioned the sum of £25,000 for the construction of the first section of artificial filters on 60 additional acres.

Rhyl and its Water Supply.—In consequence of the rapidly-increasing summer and winter population of the Rhyl district, the urban district council, who are the owners of the water service to the town, have decided to take steps to increase the delivery of water from the reservoir. Mr. F. Storr, Wrexham, who has been consulted, recommends the council to lay a new 8in. main from the bottom of the hill on which the service reservoir is situate to the elevated ground just outside Rhyl, with a new 12in. main from the latter point to the centre of Rhyl; also to construct an elevated tower, so that a pressure of 80ft. may at all times be given at Rhyl. It is estimated that a 9in. main will cost £4,750, a 10in. £6,110, and the elevated tower about £2,500. An additional reservoir for storage purposes will also have to be built.

Scunthorpe Water Supply.—At a meeting of the Scunthorpe Urban District Council on Thursday, the 10th inst., the report of Mr. Stevenson, C.E., London, was read. Mr. Stevenson, who had been engaged to examine the bore-hole and beck or spring in Rough Bottom Plantation, recommended that two bore-holes of 9in. diameter should be sunk and a reservoir of 600,000 gallons capacity placed on the hill a short distance to the east of the proposed pumping station. He estimated the cost of works, mains, and reservoir at £18,870, exclusive of land, water rights, and way-leave.

York.—A short time ago Mr. James Mansergh, the engineer in connection with the recent sewerage scheme, was asked to report on the condition of the sewer ventilation, which has, in places, been found to be offensive. He remarks that the old sewers were in a foul condition, and contained deposits which the normal flow of sewage could not displace. The free outlets have, however, changed this condition, and large quantities of long-standing deposits have already been swept into the new sewers, and this will continue for some time. Every rain-storm leaves them so much to the good. For ventilation purposes, the new sewer system of the city is divided into six parts. On the new sewers there are 441 manholes and ventilators. The length is 17 miles 527 yards, and as there are 354 open ventilators on them, there is one on an average every 86 yards, or the usual allowance of 20 per mile. On the old sewers there are 331 manholes and ventilators. The length is about 45 miles, and as there are 217 open ventilators on them there is one on an average every 365 yards—that is, only one-fourth the number per mile provided on the new sewers. Mr. Mansergh believes that the principal part of the offence lately complained of is due to the cleansing of the old sewers which is going on, and that this will right itself in time. His advice is to wait the natural process of cleansing which is going on. If any surface ventilator is peculiarly offensive, and no special cause therefor can be discovered in the sewer it serves, the remedy is to erect a shaft rising to a sufficient elevation above the road. In the old sewers the number of ventilators should be considerably increased.

STAINED GLASS.

Merchiston, N.B.—St. Michael's Established Church, Merchiston, has been embellished with a large stained-glass memorial window, placed to the memory of his wife, the Hon. Gertrude Hope, by Mr. James Hope, W.S. It occupies the east end of the church, and has been treated in the style prevalent in the early part of the thirteenth century. The window is one of three divisions, and has been filled with two tiers of subjects, the three upper ones being "The Descent from the Cross," occupying the central opening, and scenes from the life of Moses and St. Paul on either side. Below these are placed representations of the women bringing children to our Lord, and incidents from the life of Ruth and Dorcas. The work has been carried out under the superintendence of Mr. John Honeyman, A.R.S.A., of Glasgow, at the studio of Messrs. Ballantine and Gardiner, Edinburgh.

CHIPS.

The parish church of Fawley, South Hants, is undergoing renovation by Mr. Talling, of Fawley, under the superintendence of Mr. Davy, of Cadland. The whole of the ancient stonework is being cleaned and the walls distempered.

New schools for infants, which have been erected for the Eling School Board by Mr. T. J. Jukes, of Freemantle, from designs by Messrs. Mitchell, Son, and Gutteridge, of Southampton, architects to the board, were opened on Monday.

The Local Government Board have granted the corporation of Rochester permission to borrow the sum of £40,000 for sewerage works.

Additions to the village schools at Thorverton, Devon, were opened last week. Mr. J. Jerman, Bedford-circus, Exeter, was the architect, and Mr. Harry Pearse, of Woodbury, the contractor.

On Saturday, at Hinckley County Court, the Nuneaton and Chilvers Coton District Council sought an injunction restraining the Hinckley District Council from polluting Sketchley Brook. The case was adjourned pending inquiry respecting a sewerage scheme, prepared by Mr. Everard, of Leicester, and estimated to cost £3,000, which the Hinckley authority propose to adopt.

On Thursday in last week the foundation-stone of a mission room was laid at New Bricket Wood. The chapel will be 36ft. by 32ft., built of yellow stock brick with red facings, and Gothic in style. Messrs. J. and W. Savage are the contractors. Mr. J. Tanner is clerk of the works.

The corporation mace at Oxford, it seems, is the largest in the kingdom, 64½in. high, Winchester being bracketed in the second place of honour with London, also 63in. Portsmouth's great mace is 48in., that of Southampton 54in., Basingstoke 37in., Andover 20in. in length.

The Prince of Wales has presented to the parish of Babingley, part of his Norfolk estate, an iron church, with thatched roof, in place of the church of St. Felix, built centuries ago upon the foundation of one of the oldest churches in the country. The new church is close to the village, and more convenient than the present edifice, which is in ruin beyond repair.

Our Office Table.

The Technical Education Board of the London County Council have issued a report on "Apprenticeship in the London Building Trades," drawn up by Mr. F. Oldman, of the National Association for Technical Education. He states that the number of apprentices is very small, there being only about eighty, nearly half of whom belong to the carpentering and joinering division, among some 12,000 journeymen and labourers, the important cause of this scarcity seeming to be the difficulties of discipline. If the boys are guilty of misconduct, the employer has no remedy save the legal one, which is both troublesome and expensive, and therefore but rarely resorted to, and the absence of real control thus resulting is in every way prejudicial. It is estimated that if some control could be exercised by a board or competent authority acting as an intermediary between the employer and the parent something might be done to lessen the evil. As these conditions do not obtain in the case of learners as distinguished from legally indentured apprentices, there is less hesitation in employing them, and they form, perhaps, the chief source from which the trade is recruited. The employers fully recognise the advantages of some satisfactory apprenticeship system, and it is suggested that the Technical Education Board might perhaps bring pressure to bear upon the master builders to consider the question seriously. Trade unions also might issue certificates to those members of their trades who had served a proper apprenticeship; while good would be done by distributing, perhaps as prizes, the standard technical works of the trade, which are usually too expensive for the average learner or young journeyman to provide for himself.

The Hampshire Field Club has undertaken an interesting work at Winchester. Under permission granted by the late Bishop, Dr. Thorold, who was a member of the club, explorations are being made of the foundations and plan of the ancient Castle and Palace of Wolvesey, the residence for centuries of the Bishops of Winchester. The cost of this work is met by a grant from the club funds, and the excavations are being made under the capable superintendence of Mr. Norman H. C. Nesbitt, A.R.I.B.A., who has discovered sufficient to enable him to draw a plan of the Norman Palace, though this has yet to be in part verified by laying bare evidences of the actual work. The work in hand will, when completed, furnish reliable data for a more complete history of one of the most interesting buildings—now in most abject ruin—in a county rich in treasures of this kind. The plan of the building and the report of Mr. Nesbitt's careful researches will be published in the *Papers and Proceedings* of the club. The members paid a visit to Wolvesey on Wednesday in last week, when Mr. Nesbitt and Mr. T. W. Shore explained what is being done.

Mrs. May Morris Sparling lectured at the Birmingham Municipal School of Art on Friday evening on "Mediæval Embroidery." Mr. E. R. Taylor (head master of the school) presided, and, in opening the proceedings, said the school was already deeply indebted to a great man—Mr. William Morris—and on the present occasion they were honoured with a visit from his daughter, who had kindly promised to instruct them in an art in which she was an expert, and on which she was an authority. Mrs. Morris Sparling said she desired to take her hearers back to a period when, as far as they could tell, needlework decoration seemed to have reached its best and most intellectual development, when it had its recognised guilds and schools, its famous workers and masterpieces. After pointing out how the people of the Middle Ages combined with a fantastic and restless temper a boldness and strenuousness of purpose, apparently in striking contrast, Mrs. Sparling said the lighter works of an energy like this had their significance and their place in history. Embroidery played an extremely important part in that time, and when one remembered the beauty of the work, and the devoted labour which was bestowed upon it, one was indeed inclined to speak with some bitterness of the Later Renaissance in the art. Ecclesiastical embroidery in the Middle Ages was no holiday pastime for the ladies. When undertaken by amateurs it was worked in as business-like and thorough a manner as in the church schools or lay guilds themselves, and in its design were repeated the characteristics of the time. She confessed to being considerably shocked at the poverty of modern church work, everything appearing to be just a little better than it really was. It would be preferable to cover the altar with plain linen, to paint the walls white, and confess a poverty with no vulgarity in it. Mrs. Morris Sparling then explained the technique of embroideries of different periods, the lecture being illustrated by a series of lantern views of photographed specimens.

The department of Egyptian and Assyrian antiquities of the British Museum has been recently enriched by the addition to its collection of a quantity of interesting remains from Egypt, Babylonia, and Armenia. Among these is the skeleton of an Egyptian mummy. The remains are those of a man of middle age, of the Eleventh Dynasty, about B C. 2666. Two fresh sandstone tablets are among the most beautiful specimens of hieroglyphic carving in the Museum. One of these is an Imperial decree issued by Seti I. (B C. 1366), the father of Rameses II. This decree is inscribed upon a large tablet measuring 4ft. by 2ft. 8in. The second tablet measures 6ft. by 5ft., and is a funereal stele for a chief of the prophets. The most valuable additions, however, are the fragments of inscriptions taken from the tomb of Tehuti-Hetep at El-Bersheh, presented to the Museum by the committee of the Egypt Exploration Fund. In the Babylonian section a gate-socket, made of black diorite, with an inscription to Gudea, and a portion of a Babylonian sacrificial bowl, also of diorite, with an inscription of a priest-king who ruled in Lower Chaldea about B.C. 4500, are the chief additions. The latter inscription is now the oldest Babylonian one in the Museum. The most recent find in Armenia is represented by a sacrificial bowl of sandstone, 2ft. in diameter, inscribed in Armenian cuneiform with the words, "Sarduri, son of Ishpunish, this house has built."

The museum of the Edinburgh Botanic Society will shortly be in possession of a segment cut from the section of a very large Wellingtonia (*Sequoia gigantea*), obtained for the Natural History Museum, South Kensington, last year. The tree, cut down in 1892 near Fresno, California, was 276ft. in height. The section recently set in a central recess on the east side of the great Central Hall of the parent Museum at Kensington is about 15ft. in diameter, and perfectly sound to the centre, showing distinctly 1,335 rings of annual growth, and is thus of great interest as affording exact evidence as to the age of this species of tree. The still larger specimens sometimes met with are almost always hollow within, and hence the number of rings cannot be counted. The wood is of too soft a character to be of much value for commercial purposes.

At this period of the year the question of how to protect our cisterns and pipes from the effect of frost is one of apparent importance. Canvas, straw, hair-felt, sawdust, &c., have been used for this purpose, with more or less benefit in the past, but all these materials have two disadvantages—their liability to decay and their natural tendency to harbour vermin. A substance well adapted for this purpose is the glass-like fibre produced from blast-furnace slag, now widely known as "silicate cotton" or "slag wool." This article is absolutely imperishable, a most powerful non-conductor of both heat and cold, and exceedingly inexpensive. For lagging cisterns or boilers it can be packed at very trifling cost under a casing of wood or sheet-iron. The strips are supplied in rolls five yards long, 4in. wide, and from ½in. to 2in. thick, or special sizes if desired, at prices from 6½d. per yard run, according to thickness. They are, of course, equally adaptable for either cold or hot pipes, and are frequently applied to superheated pipes, on which no other non-conductor can stand. They are manufactured by Messrs. Frederick Jones and Co., Perren-street, Kentish Town, N.W.

An improved method of construction for asphalte has been patented by Mr. James Wetherill, of Henley-road, Batley, late borough surveyor of Keighley. The present mode of preparing asphalte is by softening the pitch with creosote oil or coal-tar, so that when cold it shall be tough, and not brittle in any way. This, as is well known, melts with the heat of the sun in summer on a clear day, and runs out of the joints of the paving on the surface of the road, filling up the channels and gullies. In cold weather and frost the material becomes very brittle, and crushes with the vibration of the traffic passing over the road, and is afterwards removed by the scavengers, thus leaving the joints of the sets only partly full, and so allows the water to get under the sets and loosens them. Mr. Wetherill's patent improved asphalte is made in the ordinary way, with the exception that less oil or tar is used, and lime is added, thus hardening it in summer and softening it in winter. It is claimed for it that it will change as the weather changed from hot to cold, and will always keep a tough and reliable joint impervious to wet and frost. In the case of wood blocks, it allows of the expansion and contraction of the wood, and when grit is thrown on the surface of the roadway to prevent slipping, part of it will become firmly embedded in the asphalte. It will also, it is said, keep a full joint, and so prevent the splintering of the edges of the sets and wood blocks, and greatly prolong the life of the material used, and reduce the cost.

At the last meeting of the Leeds City Council, a member protested against the action of the streets committee in appointing three gentlemen as valuers in addition to Mr. Fawcett, who was arbitrator on behalf of the corporation. The chairman of the committee said the corporation had laid down the principle that they would only employ men who would not appear in any case against them, and members of the council were aware that two well-known valuers refused their services on such terms. They decided to engage the experts for all the cases, and asked was it conceivable that local gentlemen would for a guinea per case allow themselves to be excluded from every case on the other side? He contended that the procedure of the committee had been the most economical. The total amount of the claims in the 30 cases (out of 63) which had been settled was £87,808 6s., and the amount for which they had been settled showed a reduction of £39,475 16s.

The great tunnels of the world will be surpassed by the Simplon, which, when completed, will be 11 miles in length. The Hoosac, the first great railroad tunnel, begun in 1854 and finished in 1876, is one of the four great mountain tunnels, and is 4½ miles in length, and the mountains it bores are 2,504ft. and 2,212ft. above the sea level. The others are Mont Cenis, St. Gothard, and Arlberg. Mont Cenis is 7⅝ miles long, St. Gothard 9¼ miles, and Arlberg 6⅜ miles. It took 14 years to construct the first, nine years to build the second, and five years to complete the last named. These facts and figures are given in an article recently published by Mr. Robert Jamison in the *Chautauquan*. With the compressed-air rock drill greater achievements are probably in store.

It is not expected that the Arc de Triomphe will stand out free from the scaffolding now round a large portion of it in less than ten months' time. M. Esquie, the State architect, has viewed the staging erected, and reports that the stone used in construction is very bad in quality, and that the cornices and portions of the frieze are much dilapidated. The restoration of the reliefs will, he estimates, cost £12,000, but the work cannot go on until the Chambers vote the requisite funds. At the same time, those who object to the periodical encumbering of the famous monument with wooden beams and planks, are told to recollect that frequent repair is necessary.

The arrangements and details of a cold-room or ice-chamber of a wholesale meat house are described in a New York journal. The brick walls are insulated by boards and building paper, with air spaces between. The studding to the brick walls is 2in. by 4in., sheathed with 1in. matched boards, which in turn are covered with a double thickness of building paper, and, lastly, with a second and outer sheathing of inch matched boards. The furring forms an air space between the outer brick wall and the board sheathing. There are thus three sheathings: one of board furred from brick wall; a second one of paper, with air space made by inch strips; and a third inner sheathing of inch boards, also kept free of the paper by a furring of inch strips. The window openings have 2in. by 4in. strips, top, bottom, and sides built into the masonry. There are four sashes to each window, and air spaces between them. The jambs are of planks, closely fitted to the brick reveals, with paper between, and also to the insulation sheathing described. The roof is sheathed with two thicknesses of matched boards, with a double layer of paper between, and the same is repeated below the ceiling timbers.

MEETINGS FOR THE ENSUING WEEK.

Friday.—Architectural Association. Conversazione at the King's Hall, Holborn Restaurant. 8 p.m.

Saturday.—Builders' Clerks' Institution of Great Britain. Meeting for Organisation at Cannon-street Hotel. 4 p.m.

CHIPS.

Probate of the will of Mr. George Knowles, of Shipley Moor, and formerly of Bradford, architect, and a member of the Shipley Local Board, who died on the 26th July last, aged 79 years, has been granted to his widow. The net value of the personal estate is £3,210.

A new organ which has just been built in St. Peter's Parish Church, Woolton, by Messrs. Forster and Andrews, of Hull, was opened on Friday. The organ is inclosed in an oak case with ornamental frontal pipes, and cost about £1,400.

The Aberdeen Harbour Board adopted, on Monday, plans for the improvement of Torry harbour, expected to cost £4,700.

M. Nénot was elected, on Saturday, a member of the French Academy of Fine Arts, Section of Architecture, in the place of the late M. Ancelet.

Mr. G. F. Watts, R.A., at the suggestion of the Kyrle Society, has presented to the Missions to Seamen Institute, Poplar, an original chalk drawing of his famous picture "Hope." The drawing will hang in the large recreation room of the institute.

Additions have been made to the Nelson relics at the Royal United Service Institution, among them being the bedstead that Lord Nelson used on board the Victory.

At Sandwich the mayor and corporation have under consideration a scheme for constructing a steam tramway from the town to the sea front. The promoter of the scheme is Mr. Stevens, the engineer for the recently-completed Rye and Camber tramway.

The parish church of Ewerby, near Sleaford, has undergone a restoration, mainly at the cost of the Earl and Countess of Winchilsea. The chief feature is the new roof, which has been constructed of oak, cut twelve years ago from the Haverholm Estate, and valued at £1,000. The altar, reredos, lectern, pulpit, and chancel furniture generally are new. The total cost of the restoration is about £2,500. Mr. F. Pattinson, of Ruskington, has carried out the work, and Mr. C. H. Fowler, F.S.A., of Durham, was the architect.

New banking premises are about to be erected in the Thoroughfare at Woodbridge, for Messrs. Bacon, Cobbold, and Tollemache, from plans by Mr. T. W. Cotman, M.S A., of Ipswich.

At St. Helen's Church, Sefton, on Friday, a new stained-glass window was unveiled in the west end of the north aisle. The work has been executed by Messrs. Lavers, Westlake, and Barraud, of Endell-street, W.

At the Exeter County Court, on the 10th inst., Mr. Charles Brealy, builder, of St. Thomas, sued Messrs. Starkey and Knight, of Tiverton, to recover £50 under a contract and 15s. 5d. for extras. Judgment was given for the plaintiff for the 15s. 5d.; but for the defendants on the claim for £50, as the surveyor to whom the matter had been referred was of opinion that the work had not been carried out according to the contract.

The introduction of mechanical motive power for Glasgow Corporation tramways has been under consideration almost ever since the concern was taken over by the town council over a year ago. A specially-appointed sub-committee has now definitely decided that mechanical power shall be adopted, although the specific form has not yet been fixed upon. It is probable that different methods will be utilised on the various routes, as may be most suitable for the gradients or localities.

The Duke and Duchess of Sutherland left Dunrobin Castle on Friday by special train for Forsinard and the north coast of Sutherlandshire. They drove down Strathalladale, along the route of the proposed light railway from Forsinard to Portskerra. The survey and plans have been completed, modifications having just been made on the plans so as to cheapen the cost and ease the curves, and they have now been submitted to Mr. Murdoch Paterson, the consulting engineer; and after his examination and revision of the estimates the necessary application, with plans and certificates, will be lodged with the Board of Trade before November 30th.

On Wednesday week a new organ, which has just been placed in Woolton Church at a cost of £1,400, was formally opened. The instrument has been built by Messrs. Forster and Andrews, of Hull, from the specification of Mr. E. Townsend, Driffield. It is inclosed in an oak case, carved to match the screen filling in the south side of the chancel, and the ornamental pipes in the chancel and nave are decorated in gold and French grey.

Trade News.

WAGES MOVEMENTS.

Swansea.—New rules governing the relationship between the master builders of Swansea and operative carpenters and joiners were signed on Saturday by representatives of both parties, and the strike, which has lasted 15 weeks, terminated. One of the new rules provides that if any alterations are desired in the rules they shall be effected by five months' notice, to expire May 1. The rate of wages is to remain at 8d. per hour.

The Skilled Labour Market.—The monthly memorandum of the Labour Department of the Board of Trade says that in most of the important industries the state of the labour market continued to improve during September, and the percentage of unemployed in unions making returns is lower than at any period since 1891. The building trades continue busy in most districts, the percentage of unemployed members in unions making returns having fallen from 1·8 in August to 1·6 in September, compared with 3·6 in September, 1894. On the whole, the furnishing and wood-working trades are well employed, and the percentage of unemployed union members has fallen from 2·7 in August to 2·6 in September, compared with 4·7 in September, 1894.

A number of specimens of oak carvings from old houses recently pulled down in Ipswich have been added to the collection in the Museum of that town.

The town council of Christchurch, Hants, have under consideration a scheme prepared by their borough surveyor, Mr. Walter Knapp, for the sewerage of the town. The proposed works would cost, it is estimated, £15,476.

The Seven Incorporated Trades of Aberdeen inaugurated, on Friday, additions and alterations that have been made to their building, Trinity Hall, Union-street, the scheme costing about £12,000. The marble staircase is regarded as the finest of the kind in the North. The vestibule ceiling is divided into eight panels, surrounded by Gothic mouldings, in the centre of each being a representation of the trades' coat-of-arms. A supper-room, lighted from the south by four stained-glass windows, has been added, while a number of new rooms and the rearrangement of others complete the scheme.

The water supply of Leeds has been augmented by the laying of an additional main, 30in. in diameter, between Swinsty and Eccup reservoir, a work which has been completed under the supervision of Mr. Thomas Hewson, the city engineer, this week. Henceforth the gravitating supply of water to Leeds will be by three 30in. mains from Swinsty reservoir, and, excepting on very rare occasions, there will be no pumping required at Arthington. For the better supply of water to the high-level districts of Beeston, a main is about to be laid from the high-level pumping main at Whingate. The laying of this main will cost £1,000, but it will form part of the mains which are to be laid in connection with the high-level service which it is intended to bring from the Washburn valley by new reservoirs to be built there. These reservoirs will not be completed for about seven years.

The enlargement and renovation of St. Peter's Church, Pembury, was celebrated by reopening services held last week. The chancel has been opened out into a newly-erected organ-chamber, choir-stalls have been placed in the chancel, and the new chantry has been made a continuation of the north aisle. On the south side the vestry has been correspondingly enlarged. The walls of the chancel have been redecorated, and the chancel floor has been laid with tiles. The organ has been removed from the west end of the church to the organ-chamber. The alterations have provided extra accommodation for 70 adults. The church has also been redecorated, gas has been laid on, and hot-water apparatus has been put in. The diocesan architect, Mr. Philip Day, prepared the plans; and the work has been carried out by Messrs. Penn. The cost has been £1,200.

A public lavatory has been constructed by the St. Giles's District Board of Works at the Holborn end of New Oxford-street. It is placed beneath the roadway at a depth of 14ft., and the superficial area is 1,500ft. The work has been designed by Mr. G. Wallace, C.E., engineer to the board, the contractors being Messrs. C. W. Killingback and Co., of Camden Town. The sanitary arrangements have been carried out by Mr. G. Jennings, of Palace Wharf, Lambeth. The convenience is ventilated by means of Blackman's air-propeller, worked by water power, the waste water being used for flushing purposes. The roof of the convenience is formed with rolled steel girders and trough-plates, supplied by Messrs. J. Westwood and Co., of Millwall, who also supplied the staircases, which are formed of iron framing, fitted with Andrews's patent reversible treads. The net cost was about £2,500.

LAVERS and WESTLAKE.
PAINTED GLASS WINDOWS.
MONUMENTAL BRASSES.
MURAL DECORATION.
ENDELL STREET, BLOOMSBURY, LONDON, W.C.

FAMBRINI & DANIELS,
Manufacturers of IMPERISHABLE CONCRETE MASONRY for
CORNICES, STRING-COURSES, MODELLED PANELS, AND EVERY STONE-WORK REQUISITE.

The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

⁂ Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Axminster.—For the supply of 450ft. of 6in. water main, for the rural district council:—

Dening and Co., Chard	£67	10	0
White, F., Colyton	61	10	0
Parsons, W. B., Axminster... ...	59	10	0
Frost, A. "	51	17	6
Otton, F. " (accepted)	48	7	10

Bedford.—For the supply of 200 cast-iron electric-lamp columns, for the town council:—

Bradley, W., Brighouse, Yorks (accepted)	£449

Bexhill.—For the erection of business premises St. Leonard's-road, for Mr. Joshua Taylor. Mr. J. B. Wall, architect:—

Gold, C. H., Bexhill (accepted) ...	£787	0	0

(Lowest tender received.)

Bexhill.—For the erection of corner premises, Sackville and Western-roads, for Mr. A. Pritchard. Mr. J. B. Wall, architect:—

Padgham and Hutchinson	£1,290	0	0
Gold, C. H. (accepted)	864	0	0

Bexhill.—For alterations and additions to Nos. 1 and 2, Congressbury-terrace, for Mr. Hoile. Mr. J. B. Wall, architect:—

Newman, W. G.	£393	0	0
Gold, C. H.	375	0	0
Barker and Rogers (accepted) ...	369	0	0

Blyth, Northumberland.—For pulling down and rebuilding the Croft Arms, for Mr. Hugh Reid, Waterloo. Mr. W. E. L. Thompson, 1, Turner-street, Blyth, architect:—

Barron and Temple (accepted) ...	£1,040	0	0

Blyth, Northumberland.—For the erection of a dwelling-house, for Mr. W. Charlton, solicitor. Mr. W. E. L. Thompson, 1, Turner-street, Blyth, architect:—

Barron and Temple (accepted) ...	£941	0	0

Bromley-by-Bow, E.—For providing and fixing a new vertical boiler and hot-water coils in the Alton-street School, Bromley, for the London School Board:—

Potter and Sons (Ltd.)	£135	0	0
Davis, G.	130	0	0
Cannon, W. G., and Sons	125	0	0
Wontner-Smith, J., Gray, and Co.	109	18	0
Vaughan and Brown...	108	0	0
May, J. and F....	105	0	0
Clarke and Son, Featherstone-street, E.C. (accepted)	84	0	0

Builth, Radnorshire.—For carrying out street improvements, for the urban district council:—

Jones, J. M. (accepted)	[illegible]	[illegible]	0

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2129.

FRIDAY, OCTOBER 25, 1895.

INTERESTING HOUSES.

WHILE the Building News Designing Club is engaged on the drawings for a country house, a great many questions connected with planning and design will naturally suggest themselves. Many of these are familiar enough: they have been considered and answered, in books and lectures and articles, ever since architectural literature began. Of course, the answers are not final or exhaustive. Manners and modes of living change; circumstances vary, and the solutions of a problem which were satisfactory fifty years ago may be very inappropriate to-day. Moreover, the questions which have received most attention are what go by the name of "practical" ones—questions, that is, relating to comfort, to health, convenience, and the like. Matters of this class are never long forgotten. They are things of the body; and the body may be trusted to assert its claims in season and out of season. They get the first hearing; they nearly always take the lead in deciding for the architect what is and what is not to be. And yet it does not do to listen to them too exclusively. Even the modern man has a mind, though sometimes a very small one; and when his body has been waited on, and coddled and fussed about till there is no possibility of doing any more for it, this mind is apt to assert itself and make him uncomfortable. In all the mechanical luxury he has brought together, it finds nothing for itself. He has built a house, but not a home. There is no soul in it: he sickens of its splendour, and wishes himself, perhaps, in some interesting old cottage he knew as a boy.

Ninety per cent. of modern work is wearisome even at first sight. There is not an idea in it which we do not know by heart. Its very monstrosities and absurdities are not original, but only the stock ones of the period; and the "ornament" under which they try to hide themselves is the same flat, lifeless stuff we are hourly wishing to get away from. It is odd that new work should be nearly always stale, and old work nearly always fresh; but so it is. In close connection with this fact is another—that new work is generally very ornate, and old work very plain, and yet the old is as beautiful as the new is ugly. A modern house, very often, gives one the same sort of impression which a modern picture gave to the farmer in *Punch*, "Why, the paint on this picture would come to five pounds, let alone the mon's time in laying it on." Just so: it is the cost of the "paint," of the materials, the mouldings, the decorations, which usually forces itself on the attention in the modern house. The "man's time in laying it on," the architect's skill in putting it together, was obviously a minor matter. What strikes everybody, is the lot of money it must have cost.

There are some old buildings which leave the same impression; but they are comparatively few. Modernism, it is true, began to come in with Queen Elizabeth, or perhaps even earlier, with Henry VIII. But except in the show-houses of the richer nobility, it did not make much progress for another century, and in some districts the farmer and the cottager kept clear of it down to quite recent times. They had no money to spare for finery. The village mason could not make himself an everlasting memorial by magnificence. Yet he did not wish his inventions to be quite undistinguished, and as he could not put ornament into them, he put thought, which was infinitely better. He left us in each, not a lot of stock patterns selected out of some manufacturer's catalogue, but some little fancy of his own pure brain, which nobody had exactly thought of before, and nobody has copied since. It was generally, too, a fancy which had some unpretending beauty about it. It did not exhibit, as so many contemporary attempts at novelty do, only the originality of ignorance. It was the work of a man who knew what his fellows had done in like cases, and who used this knowledge to do something equally good, and yet altogether different. Let us take a few examples of interesting old houses, and note a point here and there which makes them interesting.

Round London, as soon as we get beyond the boundaries in which the more rigid building regulations are in force, we find ourselves up to the eyes in what passes for half-timber work. The jerry-builder, and his brother, the jerry-architect, have both discovered that it is cheap and attractive. Inferior Swedish wood, used thin and painted over, with inferior rough-cast as a filling-in, makes a great show; though a painful one, when the maker daubs its quarterings over with reddish-brown, in violent discord with his red bricks, and puts his sashes into half-mourning by a white line round a dark frame. But how sickening all this mechanical effort at the picturesque rapidly becomes! There is no thought, no spirit, no heart in it. At the best, the same commonplace sets of lines are repeated in cottage after cottage, through street after street. Bad construction, bad design, and absence of all effort at better, characterise the great bulk of suburban building. They are making half-timber work a by-word, as they formerly made stucco; and none will soon be poor enough to do it reverence. Turn from this to one old specimen of it—we all know it at a glance—the entrance to Stokesay Castle. It has been measured, and drawn, and photographed from this point and that point, as if no one who saw it could help taking down some sort of memorandum of it. Yet every sketch attracts us. It never grows stale; it seems always to have more ideas in it than we have yet realised. How is it that we can admire it so long? The general grouping is of the simplest. There is an oblong building, roofed in one span, with a gable at each end. It stands sideways to the road. It is of two stories, of which the upper one overhangs, perhaps, a foot. The entrance archway is in the centre of the longer sides. In strictness, it is not an archway, for it is covered, on the front face, by a carved beam resting on two moulded posts. The upright timbers of the lower story are strong and massive, and set near together. They are framed into a sill at top and bottom, and a horizontal piece is halved across them. There are two or three short braces, obviously structural, and not decorative, and windows are inserted here and there. So much for the lower stage. Above it, on the wall of the upper room, the timber-framing is arranged in an unusual and yet unpretending pattern. The freshness of its design is the first thing that strikes the spectators. The wall is divided into squares of about 3ft. by stout vertical and horizontal framing, and then four rather lighter braces, forming a lozenge, are inserted into each square. There is no cusping, no circular cutting even, below the level of the eaves, and yet anything fuller of effect and individuality is seldom to be seen. But if the arrangement had been quite as uniform as our previous description would make it appear, the eye would soon have understood it, and seen through it, and sickened of it. This is just what a good artist everywhere expects, and guards against. If his work is to impress you at the first view, it must look simple; and yet, if it is to impress you long, it must not *be* simple. This is just what happens at Stokesay. The first impression is that you are looking at 16 lozenge-shaped figures inclosed in squares. But when you look again, you find that there are only 15 lozenges, and that one of the squares contains instead a T-shaped form. This is not all, for you next discover that two more of the lozenges, and only two, are divided into triangles by slender uprights, which bisect them. Finally, it turns out that no two of the figures are quite alike. They vary by slight shades in width, and the timbers which form them vary by slight shades in thickness. They were never "sawn die-square," as the mechanical modern architect specifies his to be, and the result of it all is that there is an endless variety of line about them which one never quite sees through, and, therefore, never wearies of.

The sixteen squares, again, are divided into two sets by irregular uprights, which frame-in a window over the archway. The modern architect's natural idea would have been to make this centre to a still richer pattern than those which adorn them. But the ancient builder knew where to leave off. He felt that some relief was wanted here, that he had put in as much pattern work as could really be enjoyed, so he went back to plain, ordinary construction for a little while. Half a dozen vertical timbers, short and long, with unequal spaces here and there between them for lights, make up the central feature of his façade. But he did not see why, because for the moment he had given up making his timbers into patterns, he should renounce every sort of decoration at this important point. What he did was to put in some which does not do away with the generally irregular effect of the centre, and yet which is very beautiful when you do see it. He carved the surfaces of his principal timbers just at this point. Then above this centre he put a gable, and there he went back to his patterns of oak framing, and made them richer than before. Here they are curved and cusped. But, seeing that the richer a form is, the less repetition it will bear, he only puts five of them instead of sixteen, and he varies these considerably in size and shape. His gable finishes with a barge-board. The modern man would probably have pierced this with tracery richer still. But the ancient one knew that he had put in quite tracery enough, and his barge-board is straight and unbroken, but covered with delicate carving. Looking at the whole design of this entrance, one realises more and more its skilfully concealed richness. There is nothing flashy about it. It does not seem at first half as costly as it is. It is a lesson in reserve, in proportion, in informality.

Most of all, however, it is a lesson in invention. Its author has really given us something out of his own mind, which, if not better than more familiar types, is, at least, good as well as new. He has got a new effect out of very simple lines, in his timber patterns, and has worked out another new idea successfully, by making the central bit of his elevation the plainest part of it. He, having a castle in hand, has done his work in a fairly elaborate way. But other architects of old made their work interesting by mere freshness of fancy, with hardly any elaboration at all. A couple of square chimneys set diagonally, with a bit of Gothic panelling for their base, are enough to give individuality to the Old Hall at Rough Lee.[*] A stepped gable as a base for other chimneys does the same at Kirby Hall.[†] Two or three lozenge-shaped chimneys splayed off into squares, and a seven-light window with brick mullions and a peculiar pointed arch above them, produce the same result in an old house at Eltham, Kent.[‡] Some great, flat-topped, bay windows give a soul of its own to Rakedale Hall.* At Canon's Ashby, the distinctive feature is an oriel high up in the principal gable, with a single-light window adjoining it on each side. Hoghton Tower, Lancashire, has a polygonal bay corbelled over to gabled roof. Newton, Yeovil, has its windows between, and not in, its gabled bays or projections. Great Chalfield has a semicircular oriel of Tudor date, with a cresting instead of a parapet. Gayton Manor† has polygonal bays, set back, in the attic story, to rectangular ones. One might go on endlessly with such examples. Almost every old house shows, in some feature or other, a treatment peculiar to itself. This is at the bottom of its individuality, its interest. But this is not all. Anybody, if he likes, can treat some feature in a building as nobody ever did before, and as nobody will ever wish to do again. The peculiarity of old work is, first, that the treatment, however original, impresses us as tolerable, and even agreeable; and next, that the whole design is so shaped and modified as thoroughly to harmonise with it. If these two conditions are only satisfied, the more originality our young architects can give us the better.

STREET IMPROVEMENT.

THE rapid increase of street traffic has rendered it compulsory on the authorities of our larger cities to widen the thoroughfares whenever any occasion presents itself, such as the demolition of business premises, destruction by fire of buildings, clearance of old crowded dwellings; and this widening, in its turn, has created the necessity of providing, for the safety of crossing pedestrians, small paved areas or "islands" in the centre of the roadway or at certain intervals. The great use and safety of these harbours of refuge from the incessant street traffic cannot be overrated, particularly by all timid, nervous or infirm people. Another improvement has been the enlargement of the intersections or centres of traffic by removing all properties at the corners, and by making circuses like those of Ludgate-circus, Piccadilly-circus, and Oxford-circus. The London County Council have not been neglectful in forming these centres whenever the clearing of old premises enabled them to do so. In the centre of this circular area a paved "island," with a central lamp-pillar and posts, has been placed; but why have not the Council gone a little further, and covered in the space by an ornamental pavilion roof, which would afford a welcome shelter to pedestrians in rainy weather? Perhaps it will be argued that such shelters would afford a refuge for "loafers," and be little used by those for whose benefit it is intended. Similar objections have been urged against providing seats in open spaces and parks, and in railway stations; but we are by no means convinced that, with proper police supervision, these difficulties are insuperable. In some towns roofed spaces have been erected, and in several Continental cities they are to be found amongst other accessories of public convenience. An interesting and instructive lecture was recently given before the Franklin Institute by Mr. Paul Gerhard, C.E., in which that gentleman sketched a very comprehensive scheme on the "Laying out of Cities and Towns." The gist of the lecturer's remarks is that municipal authorities should map out a general scheme of improvements on practical and æsthetic principles, affecting not only the planning of streets and the growth outwards of towns, but the architecture of the buildings to be erected, and the embellishments of the streets, squares, and gardens—a very large scheme, and almost visionary in the case of old cities, whose main thoroughfares and buildings are fixed, and the growth of which is mainly by the addition of outlying districts. London supplies us with an example of a city already cast in a mould, unalterable in many respects, and which admits only of piecemeal additions and improvements. Mr. Gerhard's remarks, however, refer to old as well as new towns, and in this connection they are suggestive. Under one aspect he dwells on the extension of ancient cities by the alteration of the older parts made necessary by the increased internal traffic, to be done only by the widening of streets and a reconstruction of narrow and crowded portions. Even American cities of comparatively recent date grow up in haphazard manner, and it is admitted render the application of any principles or plan out of the question. Comparing European with American cities, the author is compelled to admit the superiority from an architectural point of view of the former, the more beautiful and ever-changing street perspectives, the location of monumental buildings, the more picturesque arrangement of the streets and the garden elements. The "American city streets," he says, "lack architectural effects; we have too many dull, stupid, and monotonous rows of houses, each house identical with its neighbour, and in the business portions, the ugly sky-scrapers of many stories shut out the light of day, the blue of the sky, and the pure air of heaven, while there is a lack of prospects and outlooks of ever-varying views and of impressions of beauty." The "rectangular" system of street laying-out, it is also admitted, does not meet practical requirements, and is very inartistic.

The requirements of the problem relate to traffic, to building, and to sanitation. It is fortunate, says our author, that in street architecture the art requirements coincide with those of hygiene. Generally it is so; lofty and commandings buildings require a large area of site, for obvious architectural reasons; a wide street is more capable of architectural effect than a narrow one, and is equally favourable to hygiene; a noble square has an architectural as well as sanitary value. Everything, too, which assists to embellish a city has a hygienic influence. It would take us far beyond the limits of these remarks to discuss the suggestions made by the author. In the planning of a new town axiomatic principles can be laid down, such as the main centres of traffic, and the leading lines of streets in accord, not only with the requirements of traffic, but for architectural effect. We may also arrange for radial and diagonal lines, for belt traffic; for the pedestrian apart from the vehicular traffic, for heavy truck or waggon traffic, as well as for lighter passenger vehicles and tramway lines, and determine the width of streets according to their use and length. The problem, as applied to the ordinary English city, is very different: we cannot apply general principles; all we can do is to improve the main streets when circumstances are favourable, and apply to the outlying and newer districts convenient means of communication. Now and then a central artery can be widened, at first partially and then throughout, as the City Commissioners of Sewers have done in Ludgate Hill, and the L.C.C. are doing in the Strand and other streets by setting back the building frontages. These are opportunities which may not occur again in a century. A new street from the Strand to Holborn is a foregone conclusion. All we say is: Make it equal to the occasion by studying its best direction, even should it have to deviate from a straight line, and endeavour to make all the main centres in its progress as convenient and artistic as possible. Other and equally important lines can no doubt be suggested to connect the great thoroughfares north and south; but how much better would it be to make use of as many of the older streets as possible—widen them if we like—and make the intersections rallying points for traffic and also guides to the visitor and pedestrian. Again, in erecting our new public buildings, we should be following a useful principle to endeavour to place them in or near those localities which have become centres of traffic or business; buildings like the L.C.C. offices would be desirable for many reasons in the Strand, or near Charing Cross, and it is necessary in planning a new thoroughfare, or widening an old one, to have in view the probable requirements of public offices, vestry halls, free libraries, polytechnics, and courthouses in the locality, and provide large squares or sites for them. In the suburban or outlying districts too much is left to chance. We have, for instance, good residential localities spoilt or deteriorated in value by the erection of objectionable factories, chemical works, and fever hospitals—buildings which ought to be situated in parts sufficiently isolated from residential estates. These are anomalies which in the near future will have to receive more attention.

In the reconstruction of town thoroughfares, more attention ought to be given to sanitary wants, ample subways for sewers, water, gas, and electric wires, easy removal of refuse from the denser neighbourhoods, means for its speedy destruction, a system of pipe mains with shut-offs, hydrants for cleansing the streets, water troughs, and fountains, and other public conveniences. Our present system of conduits for electric lighting and telephonic communication in our street pavements is far behind that of other countries, while our gas and water mains and sewer-pipes are generally buried deep into the roadway, requiring extensive and obstructive excavations every time there is a leakage, or a new house connection has to be made. Such bungling arrangements are a discredit to our sanitary science. In a great city other amenities are called for: plans should be assigned for public shelters, the planting of our streets and squares; positions for street clocks, pumps, lighting columns, letter-boxes, pavilions, automatic boxes. Why these useful accessories should be left to mercenary or enterprising companies, and our streets spoilt by their erection in undesirable places, instead of being made artistic adjuncts, is a question for every municipal body which has the design and embellishment of their city at heart.

RIVAL SCHOOLS.

IF matters advance as they have been developing in the minds of professional educationists, artists, and technical school promoters, architecture will soon be under the thraldom of schools; we shall have three or more distinct ideals of education, all clamouring for public support and favour. In the future the youthful student will be too well looked after; he will have competing schools enlisting his attention, and catering for his wants, and this motherly regard for his education and welfare will leave him very little to do for himself. What with the examinations of the Institute, the professional classes and studio of the Association, the Department of Architecture, Construction, and Modern Practice at King's College, the similar one at University College, the technical and handicraft schools, and the contemplated London County Council school, he will have plenty to choose from—rather too many for his own peace of mind. At least, he will be able to select which school suits his own predilections and tastes. But what we doubt is whether all this solicitude for the rising architect is likely to make him a better artist or a more efficient professional adviser, and these are the two qualifications which mostly concern the public as our patrons. As yet there is no agreement as to what kind of school is the best for the architect. Those who have authoritatively written and spoken on the subject are at variance on these points. Three distinct ideas of how the future architect is to be taught prevail. There are the advocates of the Professional school, inculcated by the Institute progressive examinations and the Architectural Association classes, who say that the professional man must be versed in all those special sciences and subjects which are more or less connected with building construction and architecture; he must learn the characteristics of styles and professional practice; secondly, there are the advocates for art and handicrafts who maintain that it is a mistake to burden the student with knowledge which ought to be learned in the same way as his grammar and arithmetic, and which do not help him as an artist; thirdly, there are those who are the exponents of the official mind, who would train the student in the practical application of office duties and construction, and prepare him for the work of district or municipal surveyorship. We cannot expect a young man entering the profession to avail himself of all these kinds of instruction; it would be simply impossible. The remarks made by Mr. W. D. Caröe in his opening address at the A.A. are to the point. He asked, "Shall we oppose the new tests of the Institute examinations as those of merely stereotyped efficiency, and formulate a scheme on different lines?" No doubt this would be the wish of a great many, who know that their artistic powers cannot be developed or improved by answering any number of examination papers, who detest cramming which would allow the most superficial knowledge to pass for real talent. Inadequate it must be; still, what is called "stereotyped efficiency" is better than incompetence and ignorance, and this efficiency gives a guarantee to the public. For those, we are told, who look no further than an "official guarantee of efficiency," the examinations are a safeguard. Yet there are others who see farther than mere competence in solving an equation or distinguishing a style, who want master builders and artistic directors. These can only be known by the work they have actually designed and directed.

---

* See Building News, Oct. 22, 1875.
† Ditto ditto Dec. 30, 1881.

The Art and Handicraft ideal sets something more real and related before the student; it invites him to prove his capabilities for the profession by evidence of actual design and work in studio and workshop. The young man, say this school, who can put his artistic powers into execution on the bench or the mason's banker, and set out his own work, who can model in clay his carved caps and spandrels, who can frame and put together trusses, set out and work his tracery and mouldings from his sketches or drawings, exhibits his art and technical skill in a manner at once convincing and practical. The examination paper questions on these subjects may test the memory and the theory of the candidate, but they altogether fail to bring out or develop his artistic power or feeling. An intimate practical acquaintance with materials and their handling for certain purposes and proper treatment lies at the very root, as we know, of good design. How can the examination paper deal with the suitable application of material and its treatment to any given purpose? It may draw out from the student the qualities of the best material, its properties and strength, but it cannot test the candidate's power of converting or treating it in any given detail. The only way, for instance, by which the architectural ability of the candidate can be tested in a question of moulded work or vaulting, is to give him a block of stone, and expect him to set out the work so as to cut it with the least waste, and to show how the springers are to be worked on the shaft. The institution of handicraft classes is one means of teaching the handling of materials and their right treatment. In such classes as those of the Trades Training School, Great Titchfield-street, established by the Company of Carpenters, the instruction given to masons, bricklayers, carpenters and joiners, plasterers, and others is practical; but every student can also exercise his own artistic skill or design in setting out a gauged arch, or in executing a door or window to his own design. Execution plays a great part in design. A good design implies no unnecessary expenditure of material, and a simplification of workmanship. Unless a man can show how his design can be executed, the mode of cutting the material, of making the joints, and of framing, he cannot have learned his art. Design is now taught in a very different way, as if material and jointing and labour were to be entirely subordinated or concealed altogether. By the ordinary buyer of furniture, for example, the most complete disguise of the construction is thought a virtue, and esteemed as a *tour de force*. Then, lastly, the official order of educators are seeking to give that kind of instruction which will make the best administrators, the most competent business men for official appointments. Is the talked-of London County Council school to be of this description, or will other counsels prevail? Building law statutes, Acts of Parliament are, according to some men, more important than all else, and to be crammed into the heads of the candidates. The learning of these Acts alone is a tax on the receptive faculty of the student. We do not undervalue the importance of a thorough acquaintance with building law as it applies to easements, construction, and sanitation; but the extension of the courses which he will be expected to go through—these further instalments of professional literature will not be regarded approvingly. And the question is, Are we to have better architecture and better building than we have had? This seems to be the point which is just now forgotten. If professional status and decorum, high art, handicraft, and business are to be thus severally looked after, we may surely assume an advanced and highly developed type of architect in the future. But can we expect anything of the sort? We cannot develop all these acquirements in the same individual; if we make him an accomplished professional man, he will probably be nothing better than a prig, and look down on all handiwork; if we cultivate his artistic ability, he will never be any good out of his office or studio. High professional or official attainments have seldom been accompanied by any great artistic ability, nor have they always been synonymous with successful practice. The school can only arouse the dormant talents; develop, but never create them. Hence the student of to-day must choose his own line of study. Anything is better than the commercial-professional groove into which so many are content to work, which makes the percentage system the main thing, and takes the trade catalogue as the easiest means of satisfying the client. The only way of lifting him out of this groove is to instruct him in principles of workmanship or handicraft, which will enable him to see the defective design of the ornamental terracotta panel and of the stock castings which come under his notice. The tempting and attractive catalogues of moulded brickwork and terracotta and keramic ornament, architectural woodwork, and iron castings are proofs that our systematic schools of design do not provide the best means of instruction, and that the architect is not master of those manufactures over which he ought to exercise artistic control. Cast-iron bridges, verandahs, railings exist and are erected which violate every principle of good taste in spite of architects. Buildings are put up which defy all good arrangement and design and disfigure the landscape even by men who append letters after their names, and the public are still satisfied. We hear of few remonstrances if a monster store or block in flats is erected which utterly destroys the outline of another edifice. All this we see going on around us in total indifference to what the architect has to say. We cannot think that these things ought to be if the profession were really alive to their own interests. The discerning public would never be satisfied with these abortions if they could see the profession taking a lead, showing what can be done. By making art more a reality than an abstraction to be talked about, they could do something to win it back from the hands of those who are making it merely a commercial substitute for the genuine article.

CLUNY MUSEUM.—VI.

By May Morris.

ON JEWELS.

THE jewel-room of the Cluny Museum is rich not only in contents, but in outward aspect. As I sit in the window-seat here, my eye is pleasantly filled with the low tones of full rich colour; the afternoon sun pours in across the floor and touches the jewelled crowns of the Gothic kings, their mysterious purple stones swaying slightly with the vibrations of the street outside that chance to reach this quiet room; the golden altar-piece from Bâle gleams against the dark green woodland tapestry that covers the walls, while the trees outside the window glitter in the clear, bright air. I see, too, from the arched doorway beside me, through the range of galleries, a long vista of low roof-beams, and the same pleasant, sunny light striking across the dark polished floors.

It is difficult to give in words any idea of the romantic beauty of these nine golden crowns of the 7th century. For nearly twelve centuries they lay buried near Toledo, before they were discovered and brought here, though on the same spot fourteen small crowns of gold trellis-work had been previously found and sent to the Mint at Madrid to be melted down—a fate which many a priceless treasure has shared in the dark age of the early 19th century. Most of these crowns are thought to be votive offerings; but the largest was possibly that worn in life by the Gothic king, Reccesvinthus, whose name it bears. It consists of a broad band of gold, richly worked and bordered with flat stones set mosaic-wise. It is set with large polished stones, 30 sapphires of the greatest baauty, alternating with 30 fine pearls. All round it hang little chains carrying great letters of cloisonné gold, forming the legend *Reccesvinthus rex offeret.* Below the letters hang square-set stones, and below them again pink sapphires in pear-shaped pendants. Through the centre of it all passes a slender chain, from which a jewelled cross hangs, an adornment for kings, elegant in its costliness.

The crown is attached by four chains of elaborate work to a clustering ornament of massive gold like the cup of a flower, which in its turn upholds a marvellous capital of rock crystal finely carved, from which rises the crystal ball, and finally the chain which supports the whole.

It is difficult to say wherein the beauty of this strange mass of gold and shining stones lies. There is nothing very definite to lay hold on, but yet it is one of those things that move by their remoteness as well as by their splendour, by their association with the growing race whose richly decorated architecture seems foreshadowed in their wealth of ornament. We are reminded of the wonderful jewels the early romance writers described in the most picturesque words they had command of—without much exaggeration after all perhaps—or too great strain upon imagination.

A splendour of another kind, not less interesting, though scarcely so romantic in appearance, has found a lasting resting-place in this little room—the great golden altar-piece of Bâle. It was given to the cathedral of the city by the Emperor, Henry II., in the first years of the 11th century, when in gratitude to his patron saint (St. Benedict), who had cured him of a painful illness, he rebuilt it and enriched it as a lasting monument of the efficacy of prayer.

Many other rich gifts also he bestowed, says the chronicle. A crucifix containing a drop of blood of the Redeemer and a fragment of the true Cross, a scrap of the blessed Virgin's garment, relics of the Holy Sepulchre of the

Apostles and several Saints, the imperial throne, too, encrusted with gold, silver, and ivory, and the insignia of the emperor, a consecration vestment with the imperial mantle, and a crown of silver-gilt to be suspended in the choir. For all their munificence to the church and for their deeds of piety, Henry and his wife were canonised, rest their souls! But the later history of this golden treasure is curious, and deserves a brief mention. During the Reformation it lay *perdu* with the rest of the treasure, and safe from zealous hands, in the subterranean vaults of the cathedral; but from 1529 to the beginning of this century the town of Bâle retained possession of the ornaments and sacred chalices, in spite of the representations of the bishop and his chapter, who wanted them back under their care. Then in 1834, when Bâle became divided into two independent cantons, Bâle-Ville and Bâle-Campagne, the treasure had to be divided, too. The golden altar fell to the share of Bâle-Campagne, whose worthies with characteristic commonsense and absence of any romantic humbug put it to the hammer. The Swiss mind is intelligent if venal: let us give it due credit. The Spanish Government melted into unmeaning and voiceless lumps of gold the fourteen golden crowns, priceless for their interest and rarity, which were the result of the first search for Gothic treasures near Toledo as described above. This was merely brutal and stupid: Bâle-Campagne, if the prestige of possession of an historic monument was nothing to them, saw that the thing had a peculiar market value, and sold it to the highest bidder. Posterity is the richer for this commercial commonsense, for they might have hacked it up for firewood and the gold on it.

The golden Rose of Bâle, from the same treasure, was also acquired by the museum;—a wonderful piece of goldsmith's work, of very different time and style, fanciful and precious as a jewel stolen from fairyland. It is of early 14th-century work (given by Pope Clement V. to the Prince-Bishop of Bâle), and represents a rose-tree, whose blossoms have precious stones for the dewdrops in their centres, with leaves curiously worked; all in a state of preservation.

It is impossible to include the jewelled caskets, reliquaries; rings, secular, episcopal, and pontifical; the Merovingian jewels, the carved ivories of early date that fill the cases in this room. Yet of things ecclesiastical, note specially a lovely reliquary of French work, in silver gilt and enamelled, set with stones and fine pearls, the back covered with an enamel of Jesus Christ, with a knight and lady kneeling at His feet in adoration. Among the adornments of the laity, note a rich girdle of silver-gilt bosses (the Icelanders do similar work for their women's wearing today), sewn on to velvet, which is lined with cloth of gold. The work is crisp and delicate, like all work of the 14th century, and the clasp and pendant laid with flowers and leaves in high relief, set with stones. And, further, the remarkable clasp decorated with enamel and precious stones; a great crowned eagle, his body and spread wings covered with pearls, rubies, sapphires, and jacynths, a piece of 14th-century work, notable both for its beauty and its admirable state of preservation. And the jewel caskets of carved and gilded ivory, of engraved steel, of silver decked with gold and jewels! One might think there were not enough precious stones in the Far East to satisfy the Mediæval woman's passion for glittering toys—rings for their long fingers; jewels for their necks; pearls to set round the caskets to hold them! Modern women keep their treasures at the bank, or in strong boxes of strictly utilitarian appearance; then, they kept them in lovely boxes, themselves usually inclosed in less sumptuous boxes or cases of *cuir bouilli* while travelling, for you could not leave your most treasured possessions behind you then while travelling far and wide, the luxury and refinement of the 14th and 15th centuries not including any very great security of personal belongings.

Yet this same luxury and refinement was widespread among the higher bourgeoisie, as well as among the nobles, as is amply testified by the literature of the time, which always gives full and lengthy details of the home-life in all classes. A satire written in the reigns of Charles V. and Charles VI. of France, gives a long list of the expenses attendant on the marriage of a gentleman. Women will insist on having "gowns of gold, of silken cloth, crowns and chaplets of fine gold, and silver pins." And one enumerates the toilette she must have: "Bags of precious stones, knives with imagery on them, pincushions engraved and enamelled, pelisses, rings, and clasps. A room, when I am with child, fair and well ordered, hung with white camelot embroidered; comb and mirror of ivory"; and so she goes on. Then she goes through the household wants; an interesting list, which I should like to give entire, even detailing the kitchen outfit, with its spoons and pots, and stores of herbs.

> Encore ne t'ay-je pas ouvert
> Qu'il fault escrins, huches, et coffres.

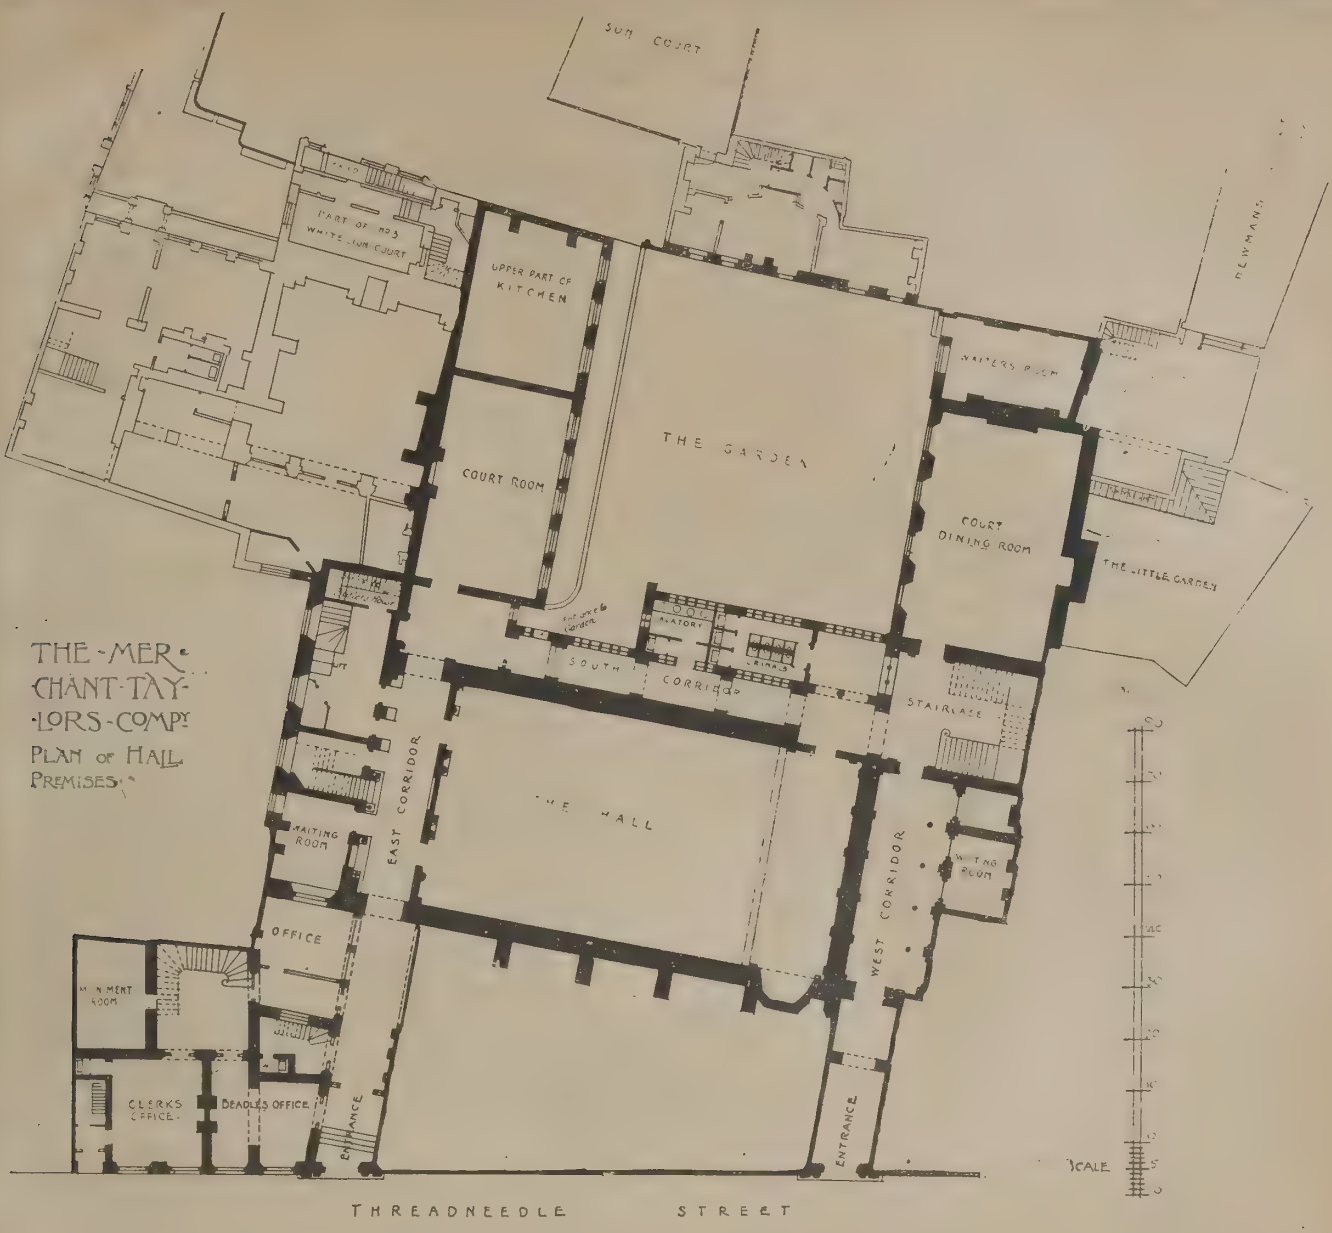
She goes on: "Still I have not discovered to you that there are wanted caskets, chests, and coffers." The author finishes by remarking, that marriages that involve all this expense are a great piece of folly.

This mixture of refinement and simplicity, as we should measure both, in Mediæval home-life, is everywhere visible. The ladies sometimes sit on the floor; but it is on furred rugs and silken embroideries. The floors are perhaps strewn with rushes; but the rushes are often scented with spices, or mixed with fresh-cut flowers. "She passed before, and he after," says an old romance, "they crossed the tower, and came into a great room laid with little rushes, which were sweet as with all the spices of the world spread thereon." ("Le Roman de la Charrette.") In another story, a lady, expecting her sweetheart, "to the hostel cometh, the fire lighting, and spreading rushes and flowers on the floor." People ate with their fingers; but had perfumed water poured on them from a gold or silver ewer. The severe lines of their richly-carved wooden benches were partly hidden with subtle cushions of tapestry and needlework. They had few personal ornaments and trifles, but those they possessed were exquisite for the style and workmanship on them.

There is a charming picture of lazy chateau life in the 14th century, quoted from the "Cronica del Conde Don Pedro Niño," by Viollet-le-Duc, in his interesting notes on feudal customs. We get a description of the castle, with its gardens, its woods, ponds and river, all most important surroundings at a period when the castle, with its vassalage, was self-supporting, and trusted almost entirely to its own resources for the livelihood of many scores of people. The Captain Pero Nino is welcomed to the castle of an old admiral of France, whose wife is of noble birth, and has in the castle domain her own *ménage* and seignorial manor apart from her husband's, though connected with his, and kept up with much ceremony. She had ten *demoiselles de parage*, or maids of honour, nobly attired, whose sole duty was to look pretty and attend on the lady. This is how they spent the day: they rose in the morning, and went to a wood near by, each with her rosary and book of hours, and prayed apart; then plucked flowers in the woodland, and went back to hear low mass. Coming out of the chapel, a silver bowl was brought containing chickens and larks and other roasted birds. Those ate who wished, and drank some wine. Madame herself ate rarely in the morning, sometimes a mouthful out of compliance to those around her. Then she rode out with her maidens and all the knights and gentlemen there assembled, and they betook themselves to the fields, and made green garlands, and sang virelais, rondes, complaints, ballades—songs of all kinds known to the *Trouvères* of France, singing in divers voices sweetly harmonising. Then back to dinner, which was eaten amid pleasant discourse and the diversions of jongleurs. After the Blessing came dancing for an hour, Madame giving her hand to the guest, Pero Niño, and to each cavalier a damsel. Then an interval of wine and spices, and the afternoon siesta. Rising therefrom, they assembled again, and went with the falcons heron-hunting along the fair river. Madame then gets off her "hackney," and gives signal for a picnic in a meadow, "and they took from the baskets chickens, partridges, cold meats, and fruits, whereof each ate. Then they made fresh garlands, and back to the castle singing sweet songs. The night at hand, they supped, and Madame went to the fields afoot to frolic, and they played bowls until the night was black. By torchlight they re-entered the hall; the minstrels came, and there was dancing far on into the night. Then were brought fruit and wine, and taking their leave, each one went to sleep." Practical and active-minded as the French bourgeoise to-day, this Norman *grande dame* of the 14th century ruled and ordered all her husband's affairs and her own, the old admiral, a rich and great lord, "meddling with nothing, as his dame sufficed thereto."

ABERDEEN UNIVERSITY EXTENSIONS.

THE quatre-centenary of Aberdeen University was celebrated yesterday (Thursday), when the extensive enlargement of the ancient buildings was inaugurated. Through the munificence of the late Dr. Charles Mitchell, of Newcastle, the University authorities were enabled to include in their scheme a new graduation hall and tower, both of which were inaugurated yesterday, as well as the departments of anatomy and surgery. The fine old staircase, which leads to the former hall of Marischal College, is now transformed into a picture gallery. This room forms an approach to the great Mitchell Hall beyond, which measures 116ft. by 40ft., and 42ft. high. At the east end of the hall there is a window, 20ft. wide by 32ft. high, filled with Perpendicular tracery. Dr. Mitchell caused it to be filled with stained glass representing, by means of heraldry as well as figure subjects, the history of Marischal College. The glass of the window was designed and executed by Mr. Spence, Rathbone-place, W., assisted in the heraldic scheme by Mr. P. J. Anderson, University librarian. In addition to the large east window, the hall is provided with ten side windows—five on each side—filled with granite tracery and stained glass, with heraldic devices representing the history of King's College. The walls are built of granite ashlar, the inside surface being dull polished, and set in gilt pointing. The granite used for the interior is from the Corennie Quarries, and of a pink hue. The mouldings at windows and arches are also of granite, axe-dressed, and the shafts of the pillars, both at the pillars and the piers between the windows, are of polished red granite. The lower part of the wall, up to the height of 15ft., is panelled in oak, and the flooring is laid with oak and walnut parquetry. The roof is also of oak, arched, and is richly ribbed. There are upwards of 200 carved oak bosses at the intersection of the ribs, and each boss is fitted with an electric lamp. Along the centre of the ceiling is fixed a series of shields emblazoned with devices representing benefactors of the University; five of these are left blank for future donors. There is a small gallery round three sides of the hall, the front of which is one mass of oak carving of the richest description. The gallery is projected from the wall without pillars, and forms a canopy over the sofa seats, which are ranged under it on both sides of the hall. The west gallery accommodates a large organ, built by the Electric Organ Company, Birkenhead, upon their new system, driven by electricity. The archway between the two halls is to be draped with painted tapestry. Besides the electric light on the ceiling, there are to be lights grouped around the capitals of each of the ten side pillars. The hall will accommodate 1,200 seated, and the area is filled with chairs made by the Bentwood Furnishing Company. The Mitchell Tower, which is also finished, is executed in granite. It measures 39ft. 6in. in breadth on each face, and from the level of the upper quadrangle it rises to the height of 230ft., and 250ft. from the lower. Four octagon turrets rise to the top at each of the four corners, each terminated by two tiers of crocketed pinnacles, the upper circling round the tapered points, being also richly crocketed. From the centre of this group of four turrets, a central pinnacle rises. This pinnacle is also constructed of granite, and is carried up from the foundation in the centre of the tower. It accommodates the staircase, and at its very top is a look-out chamber or belvidere, which visitors daily make use of. The clock faces the quadrangle. The dial is 7ft. in diameter, and illuminated. The striking bell weighs 34cwt., and was supplied by Messrs. Evans, of Birmingham. The four sides of the tower are pierced by three windows of large dimensions, filled with Perpendicular tracery. The floor under the hall, on the level of the quadrangle, contains a suite of rooms for the accommodation of the Students' Union. Entering under a piazza at the north side of the tower, a wide corridor leads to a cloakroom, dining-hall 55ft. by 25ft., luncheon buffet, with counter with rouge marble top; behind which are situated two stewards' rooms for service; and above, in an intermediate floor, is a dwelling-house for the steward. Beyond the buffet, in continuation of the same corridor, is a billiard and smoking-room, 20ft. by 30ft., then the Students' Representative Council room, and at the extreme east end a large hall with gallery on three sides, provided with a stage and division lobbies at each side on the model of the House of Commons. This room measures 40ft. by 60ft., and 20ft. high, and



will serve the purposes of a reading-room and news-room, as well as a concert-room and debating hall. The floor of the Students' Union is of pitch-pine blocks. The rooms have high dadoes of "Liberty's" arras cloth, each room being in a different colour. The walls above are painted in "duresco" in various colours. The windows are glazed with cathedral glass and lead quarries. All the rooms are heated and supplied with fresh air by means of Key's system of mechanical ventilation. On the floor under the Students' Union, on a level with the lower quadrangle, is the new anatomy department. The dissecting-room measures 75ft. by 53ft., and 25ft. high. The walls from floor to ceiling are lined with ivory-coloured glazed tiles, with several border lines of brown and yellow polished slate slabs, to act as blackboards, fastened to the wall level with the tiles at a convenient height. The floor is oak on the block-flooring system. The new surgery department consists of a lecture theatre, 28ft. by 52ft.; practical room and museum, preparation and instrument-room, diagram-room, and professors' rooms. The benches in the surgery room are arranged in amphitheatre style, and the walls are lined with white glazed bricks. The room is lighted from the roof, and, like the other departments, is ventilated and warmed on the mechanical system, and fitted with electric light. Adjoining the dissecting-room is a large laboratory, 40ft. wide by 50ft. long; a smaller one separated by means of a revolving partition, professor's private laboratory, and professor's own room; a lecture-room, 40ft. by 35ft.; and a museum, 44ft. by 30ft. In addition to these there is an anthropological museum. There are three large departments far advanced, comprising botany, pathology, and chemistry, and these will be completed early in the spring. When these are finished, the whole of one side of the quadrangle will be complete as far as the present scheme goes, leaving the opposite side of the quadrangle still to be dealt with. This side is proposed to be devoted to the large departments of natural philosophy, medicine, and the faculty of law. It is also intended to erect an administrative block in the front facing Broad-street; but money for these two latter portions of the scheme is not yet forthcoming. The cost of the whole works, as already commenced, is £104,225; but in order to complete the scheme there is required a further sum of £40,000. The architect for the enlargement and remodelling of the buildings has been Mr. A. Marshall Mackenzie, A.R.S.A., Aberdeen.

CITY GUILDS.—XI.

[WITH PHOTO-LITHOGRAPHIC ILLUSTRATIONS.]

THE HALL OF THE MERCHANT TAYLORS' COMPANY.

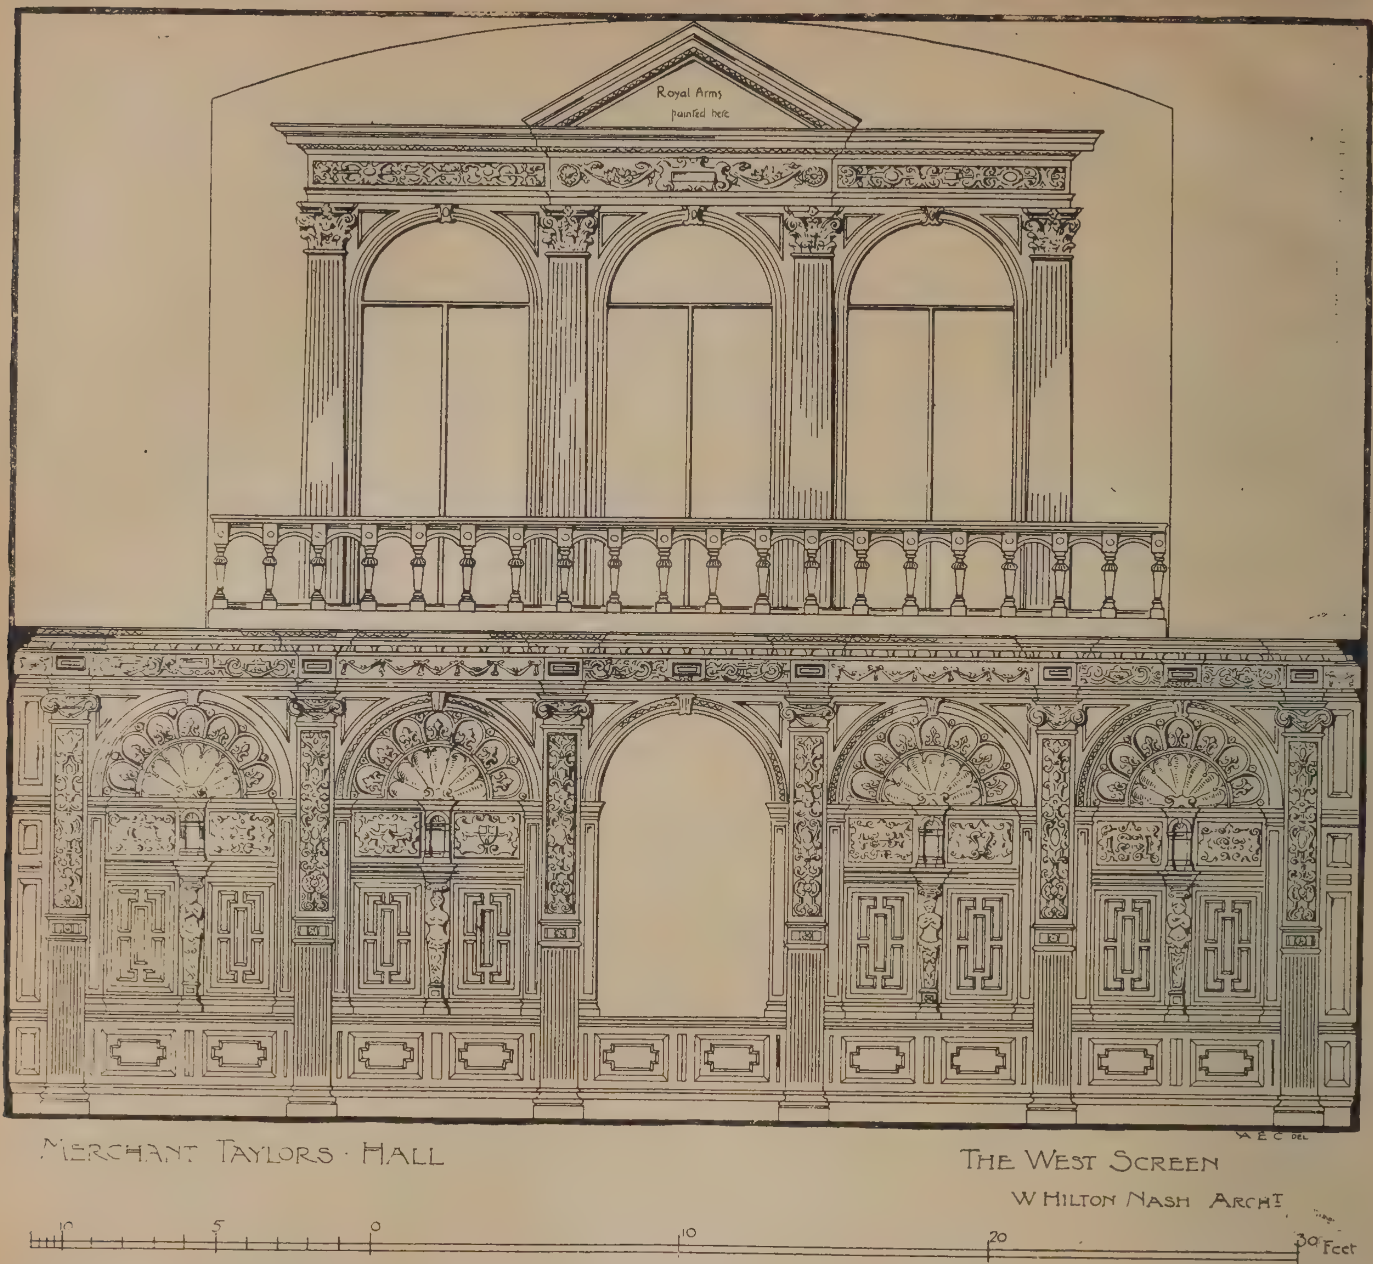
THE architect of this great London company, Mr. W. Hilton Nash, F.R.I.B.A., has been good enough to contribute the following account of its history and buildings:—

This ancient and interesting hall stands on the site of some premises which were purchased by the Merchant Taylors' Company in 1331, from Crepin, the tenant at that time being Sir Oliver de Ingham, who died whilst defending Bordeaux against Philip of France in 1344.

The Great Fire of London destroyed the greater part of the hall premises, and melted most of the plate, but the original walls remain in places. The present hall (which replaced Ingham's Hall in the 15th century) is 82ft. in length, and 43ft. in width and height, and has all the characteristics of a hall of the 14th and 15th centuries—viz., the corridor or ladies' chamber, the daïs or raised platform, the recess for the buffet, the floor or marsh, which was formerly strewn with rushes, the screen at the east end, and the minstrels' gallery over it. The stained-glass windows are filled with the arms of the former members of the Company, including several of the kings of England, from the year 1404 down to the present time. Many noted political and social gatherings have taken place in this hall. Henry VII. attended the election of master and wardens in the year 1506, and was present at the annual feast held on the Nativity of St. John the Baptist, the patron saint of the Company, the proper title being "The Worshipful Company of Merchant Taylors and Linen Armourers, of the Fraternity of St. John the Baptist."

In the year 1607 James I. and his son, Prince Henry, were entertained, and in the ancient records of the Company we read that: "At the upper end of the hall was sett a chayre of state where his Majestie sat and viewed the hall, and a very proper child well spoken, being clothed like an angel of gladness with a taper of Ffrankinscence burning in his hand, delivered a short speech contayning eighteen verses, devised by Mr. Ben Jonson the Poet, which pleased his Majestie marvellously well. And upon either side of the hall, in the window neere the upper end, were galleries or seats made for Musique, in either of which were seaven singular choice musicians playing their lutes, and in the ship which did hang aloft in the Hall, three rare men and very skilful, who sung to his Majestie."

The Master of the Company having presented the King with a purse of £100, and the Prince



MERCHANT TAYLORS · HALL

one of £50, the guests departed—not, however, before they had partaken of the banquet which was provided for them. We also find the following memorandum, which is highly amusing:—Mem.: "That it was agreed that £50 should have been given to the Queene, but by reason that she came not, £50 was saved."

The present kitchen, which is thought by some to have been the old Hall of the Company, measures 37ft. by 31ft., and is about 30ft. high. What remains of the architecture is of 16th-century type, the most noticeable feature being the arcade on the north side, which consists of three openings, with low four-centered arches, moulded with two sets of double ogees, divided by a hollow, and above them are three large windows. The south side has a window-like opening now bricked up, the east side two doorways, and the west side one doorway and a two-light window with the remains of tracery, but now built up. There are some Perpendicular corbels at a great height, which probably helped to support the woodwork of an open timber roof, no doubt destroyed at the Fire.

The crypt is perhaps the most ancient and interesting feature in the building. The walls are formed of chalk and ragstone. There are three bays groined with plain splayed ribs, springing from corbels moulded and carved with heads. The spandrels are filled with squared chalk. The style is of the 15th Century, probably about the time of Henry VIII. This crypt is about 12ft. below the street level, and may have been a cloister from the street to the chapel.

Some of the earlier records of the company take us back to the year 1267, when disputes arose between the Merchant Taylors and the Goldsmiths' Company, and in 1484 a series of street fights took place between the Merchant Taylors and the Skinners' Company, for precedence, and Lord Mayor Billesden ordained that "for norishing of peas and love" each Company should take precedence in alternate years, and feast each other annually, and this custom has been kept up for 400 years. These riots are illustrated in the stained-glass windows of the corridor on the south of the hall, the three subjects being "The Controversy," "The Award," and "The Feast."

The general arrangement of the buildings is round a quadrangle or garden, as it has been called for many years, the banqueting hall being on the north, the library on the south, the court-room on the east, and the court dining and drawing-room on the west.

In the gallery over the hall are two hearse-cloths of Italian fabric, which were used in earlier days at the burial of a brother of the mysterie. That to the left hand dates about 1490 to 1512. In the centre is depicted the baptism of Our Lord, with St. John the Baptist kneeling and baptising, and an angel holding the Saviour's robe. On each of the sides is an Agnus Dei surrounded by rays, with the Baptist holding the Lamb and a scroll, *Ecce Agnus Dei*, then angels bearing the Baptist's head in a dish with another scroll, on which is written "Caput iohis Baptist i disco." At each end is a pair of shears open.

On the shorter borders, one exhibits the Baptist's entombment, his headless body being placed in the sarcophagus by three men in rich dresses, and the other the decollation, and in the centre is the body, with the executioner exhibiting the head, and Salome holding the charger to receive it. The costume of the figures is of that period, the swordsman, of a landsknecht, with a cap and feathers, a vest slashed, and tight-fitting hose. Salome is dressed in a long gown, over which is a jacket trimmed with ermine.

The hearse-cloth to the right is of somewhat later date, 1520-30. The centre is cloth-of-gold velvet; the pattern is in purple and gold, and the outer parts of the field are entirely covered with gold and silver embroidery, while the borders have subjects connected with the life of St. John the Baptist, the patron saint of the Company. Both these specimens of embroidery are of very fine workmanship, and were probably executed in England.

There are several interesting pictures in the various rooms and corridors—viz., a portrait of Henry VIII., by Paris Bordone; a portrait of St. John the Baptist, in the style of Murillo; portraits of the Duke of Wellington, by Wilkie; Lord Eldon, and the Duke of York, and one of the Younger Pitt, by Hoppner, given to the Company by the Pitt Club. In the drawing-room are two portraits by Kneller (Charles II. and James II.), and two by Thomas Murray, of King William and Mary. Among the other portraits are Charles II., by Vandyke, Sir Thomas White, and portraits of former Masters of the Company, by Kneller. In the committee-room is a portrait of Sir A. Reynardson, a member of the Company, who was Lord Mayor in 1649, and refused to proclaim at Cheapside and the Exchange the order of the Commons of 17th March, "for abolishing the King's office." When summoned to the Bar of the House, he pleaded his oath of allegiance, and was degraded, fined, and im-

prisoned in the Tower for two months, but he adhered to his duty.

Unfortunately, the fire destroyed a great portion of the company's treasures in the way of plate; but some valuable specimens of the 17th and 18th centuries still exist, among which is a circular rosewater dish about 18in. in diameter, parcel gilt, engraved with flowers, scrolls, and strap work of the Elizabethan period, and the date is probably 1575. The Company's Mace also was saved, and is recorded to have been made in 1597 at the cost of the Beadle, who had lost the old one, and also the silver yard measure, by which for some centuries the London cloth measures were corrected. A pair of large frosted silver loving cups, made in 1680, are very handsome, and have frequently been filled with the spiced drink called "sack," of which Sir John Falstaff was so fond.

[Within the last few years the interior of the great hall has been enriched with elaborate panelled wainscot work, executed by Messrs. Dove Bros., the builders, from the designs of the Company's architect, Mr. W. Hilton Nash, F.R.I.B.A., whose drawings we are enabled to reproduce with the above particulars. The screen behind the daïs is a specially rich piece of work. We shall give further details of this oak panelling at an early date, with some other views specially taken for this series.]

THE TURNERS' EXHIBITION.

THE specimens of hand-turning in wood at the Mansion House, now on view under the auspices of the Worshipful Company of Turners, are of more than average merit. The judges who have awarded the prizes include the Past-Master, J. J. Holtzapffel, Assoc.M.Inst.C.E., the Upper Warden, Mr. Alfred Bevan, Past-Master Mr. W. Brindley, F.G.S., and Mr. A. Murray, city surveyor. Their report speaks of the general excellence of exhibits, and they consider the work submitted shows "continued progress in the desirable qualities of design, beauty, ingenuity, and novelty, and not less in the necessary qualities of utility, fitness for their intended purposes, and excellence of workmanship." They observe in some exhibits that the art of turning seems misapplied. The first prize, the Silver Medal and Freedom of the Company and five guineas, is awarded to George H. Alderton, Brighton, for a tripod workstand that can be turned to several uses, a lady's workbox, table, or flower-stand. The design consists of a tripod of elegantly-shaped legs, finishing with scrolled ends at the top, and cloven feet at the bottom, carrying a vase-shaped workbox, the lid of which forms a small table when inverted, with a workbox underneath. It is executed in polished walnut, and is an excellent piece of work. The design is simple, and the contour and mouldings tasteful. The second prize (bronze medal and five guineas) is given to R. H. Isaacs, Kingsland, for a collection of square-turned balusters of creditable workmanship and design. These are square and oblique in section, and the mouldings are good. The third prize, certificate of merit and five guineas, goes to W. Gleeson, of Cardiff, for a hall lamp-stand —a fluted shaft upon massive turned and ornamental base, with a turned vase-shaped holder for lamp. The fourth prize, of similar value, is awarded to Alfred Miller, of Walthamstow, for a collection of decorated spiral balusters of pine and walnut, executed with various overlays. The fifth prize (a book) is awarded to Geo. Olley, sen., Euston-road, for oval tables. They are well proportioned, and of simple character. The upper oval tray, with moulded edge, rests on two turned legs on a small four-legged table. They are executed in mahogany, and the workmanship is excellent. W. Watson, of Hornsey-road, receives the sixth prize for mahogany brackets, left unpolished from the tool, and the work exhibits skill in turning a rather difficult shaped piece. Six other prizes are awarded. The apprentices are not very numerous. H. Burbidge, jun., Coventry, receives the first prize for a softwood candelabrum or flower-stand, clever as a feat of turning, but lacking in refinement, and W. Arnold, of the same town, the second prize for an oak umbrella stand. We notice also the work of three previous first-prize men. A pair of polished mahogany fluted pillars for lamp stands of massive proportions, by Chas. S. Swift, Euston-road, have been sold to the Lord Mayor. In the amateur competition we may refer to the case of 16 ornaments, boxes, &c., by the Rev. C. C. Ellison, of Bracebridge, Lincoln, which receives a first certificate of merit. These exhibit wonderful dexterity in lathe work, and the workmanship is more excellent than the design. Four other amateur turners received certificates. In many of the exhibits, especially those of the apprentices, we notice a desire rather to display feats of skill than a study of the right application of lathe-work to the particular objects, as, for example, in the elaborate lamp and umbrella stand on one of the tables. The prizes will be presented by the Lord Mayor this afternoon in the Egyptian Hall of the Mansion House at three o'clock.

COUNTY LUNATIC ASYLUMS.—XXXI.

By George H. Bibby, F.R.I.B.A.

SPECIAL BUILDINGS.

IN my last article attention was directed to those special buildings for the recreation and comfort of the subordinate officials, which, although highly desirable, are too frequently omitted from the asylum, and often for reasons of economy.

There is yet another class of building that should form an adjunct to every large asylum, and that is a block for the exclusive use of those nurses engaged especially for night duties; and as the number of these in the largest asylums is not large, the buildings need be of moderate extent only. For instance, there are but nine male night-attendants, and fourteen female night-nurses at the Hanwell Asylum, where there are about 2,000 patients; and there are twelve male night-attendants and twenty-two female night-nurses at the Banstead Asylum, where there are also about 2,000 patients.

I believe it is the general custom in many asylums for the day-attendants to come on duty in the summer at 6.30 or 6.45 a.m., and for the general business of the institution to be in progress very shortly afterwards, and it will be obvious that if the night nurses and attendants going off duty at that time are to secure a proper rest after their night's anxious, and frequently dangerous and unpleasant, watch, that this would be most advantageously found in buildings placed at a suitable distance from the workshops, noisy and violent patients, and also away from apartments occupied as day and mess-rooms, &c., by day-attendants. The precise locality would vary greatly with the arrangements for each asylum, but perhaps an upper floor over the offices and board-room, &c., might be suitable, and a block of buildings near to the chronic wards has, in the case of at least one large asylum, been adopted as a suitable position for the night-nurses' buildings; but even many large asylums are quite without any suitable accommodation for night attendants, who, therefore, have to occupy bedrooms and dormitories connected with the day attendants' apartments, and consequently are liable to be disturbed, or otherwise have to occupy cottages at possibly an inconvenient distance (not only as regards their own comfort, but as relating to the requirements or advantages to the asylum on occasions of emergency).

The class of accommodation to be provided for night attendants of both sexes will be perceived if it be remembered that the wages of the male attendants are frequently about £43 per annum each, with board, lodging, washing, and uniform (if without these allowances, about £78 per annum is paid). The wages of the female night nurses is usually about £34 per annum, with board, lodging, and washing, and it is for this class of official that two separated blocks of buildings should be erected, one for each sex, with, if practicable, mess-rooms, day-rooms, a sufficient number of bedrooms, and offices, &c., wholly apart from the day attendants, and for their exclusive use, and in as quiet a part of the institution as may conveniently be arranged. A ground plan of a night nurses' home, to be formed with a connection to one of the corridors of an asylum, is shown on Fig. 47.

The accommodation on the ground floor includes one mess-room (with kitchen and scullery adjoining), a sitting-room, four bedrooms, an annexe for water-closets, &c. The whole of these apartments could be shut off by a door at A, thus securing means of absolute seclusion and quiet. On the upper floor are six bedrooms, store-room, linen-room, bath-room, and a repetition of the sanitary arrangements shown below, the whole giving a suitable accommodation for ten female night nurses. The accommodation for the male night attendants might be arranged for in a similar building on the males' side of the institution. On Fig. 48 is shown the first-floor plan of this arrangement, and a second floor might be added in the case of a large institution, or where a large proportion of night-watchers would be required.

The whole block for the night nurses would thus be almost, or quite, independent of the remainder of the asylum as regards its purpose as a residence for persons whose vigilant watching at night is of the utmost importance to the patients and officials generally, and which vigilant watching is not likely to be fully attainable unless the night attendants are properly housed and provided for.

The night attendants in the epileptics' wards, for instance, are directed to go at once to every patient in a fit, so as to place him in a position of safety against suffocation, and should not leave the patient until the fit has ended; and other patients have to be watched at night for a variety of reasons affecting their own safety and comfort, and that of all with whom they may be associated in the ward dormitories; and the slightest want of care upon the part of the attendant might terminate with serious accidents, suicide, or homicide. The necessity for a close inspection of many of the patients at night is very great. For instance, epileptics are liable to turn on to their faces during the night when their fits come on, and suffocations from this cause are certainly not unfrequent. Various appliances have been provided for the purpose of preventing this, including porous pillows, through which the patients may breathe, even though they do turn upon their faces; but the best precaution against such accidents is thoroughly vigilant watching, and this cannot be attained if the night attendants have too many patients to look after; if their hours of work are too protracted, or if proper provision for their comfortable board and lodging be not arranged for.

A building specially arranged for the purpose of a central electric station might, in the case of large asylums, be added. Probably the best position for this would be near to the main boiler and engine-rooms. In asylums of moderate size, probably the general engine-room would be suffi- to accommodate the dynamos, &c.; but now that the great advantages of electric lighting for asylums have been clearly approved, and as special asylum officials are permanently employed upon the maintenance, repairs, and working of the electric-lighting system, it would appear desirable that large installations should be separately worked in a special building erected for the purpose, where apartments would also be provided for the necessary repairs of the electric signals, alarms, telephones, and all work of a kindred nature, of which there is a great variety in extensive institutions, and where further employment in the future may be developed when *electric* cooking, ventilation, and heating, &c., have been sufficiently advanced so as to become economical necessities.

Such a building might contain, in the basement, a battery-room, a room for steam, gas, or oil-engine, with dynamos, the areas of these being dependent upon the number and description of lights or other electrical power required.

Upon the ground floor might be provided an apartment for the manufacture and repair of the electric bells, telephones, telegraphs, water-level signals, lighting fixtures and wiring, alarms, electric thermometers, and other electric appliances. This room would be of great service in connection with all asylums lighted by electricity, but situated at a considerable or inconvenient distance from a town, and adjoining this apartment should be a store-room of moderate size to contain a supply of glass globes, casings, cleats, screws, brasswork, wiring, and duplicates of all parts liable to require frequent or occasional renewal.

A small residence for the asylum electrician might be conveniently arranged for in connection with, and form a portion of, the electric supply station buildings.

Another special building (only likely to be required in connection with very large asylums) is a fire-station, with residence attached for a fireman, and from which a fire brigade would be organised, the male and female attendants being all instructed as to the use of the internal hydrants of the asylum, and the best modes of procedure in the event of an outbreak of fire. In large institutions a fireman should be on duty both day and night, for few things can be more terrible than an asylum on fire. The excitement of the

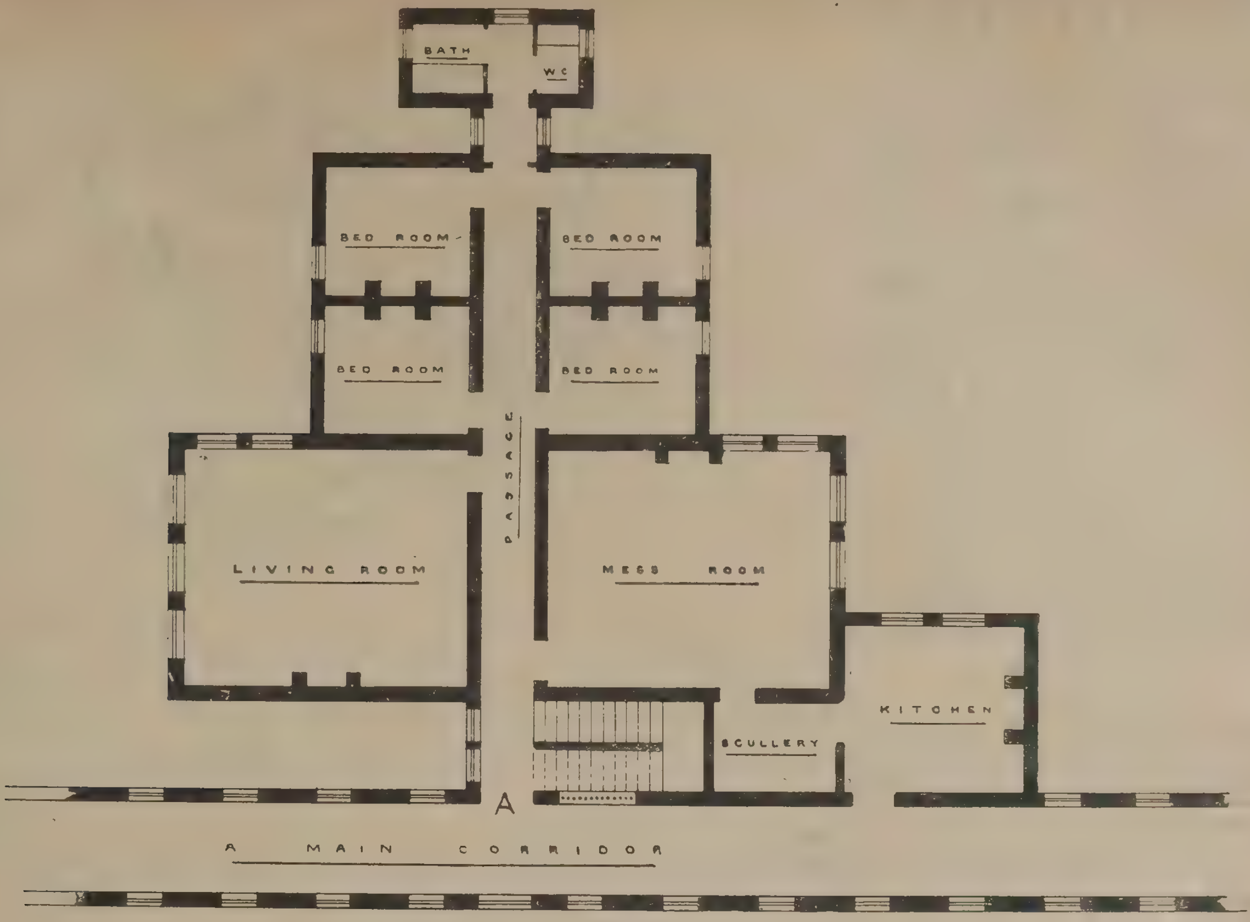

Fig. 47.

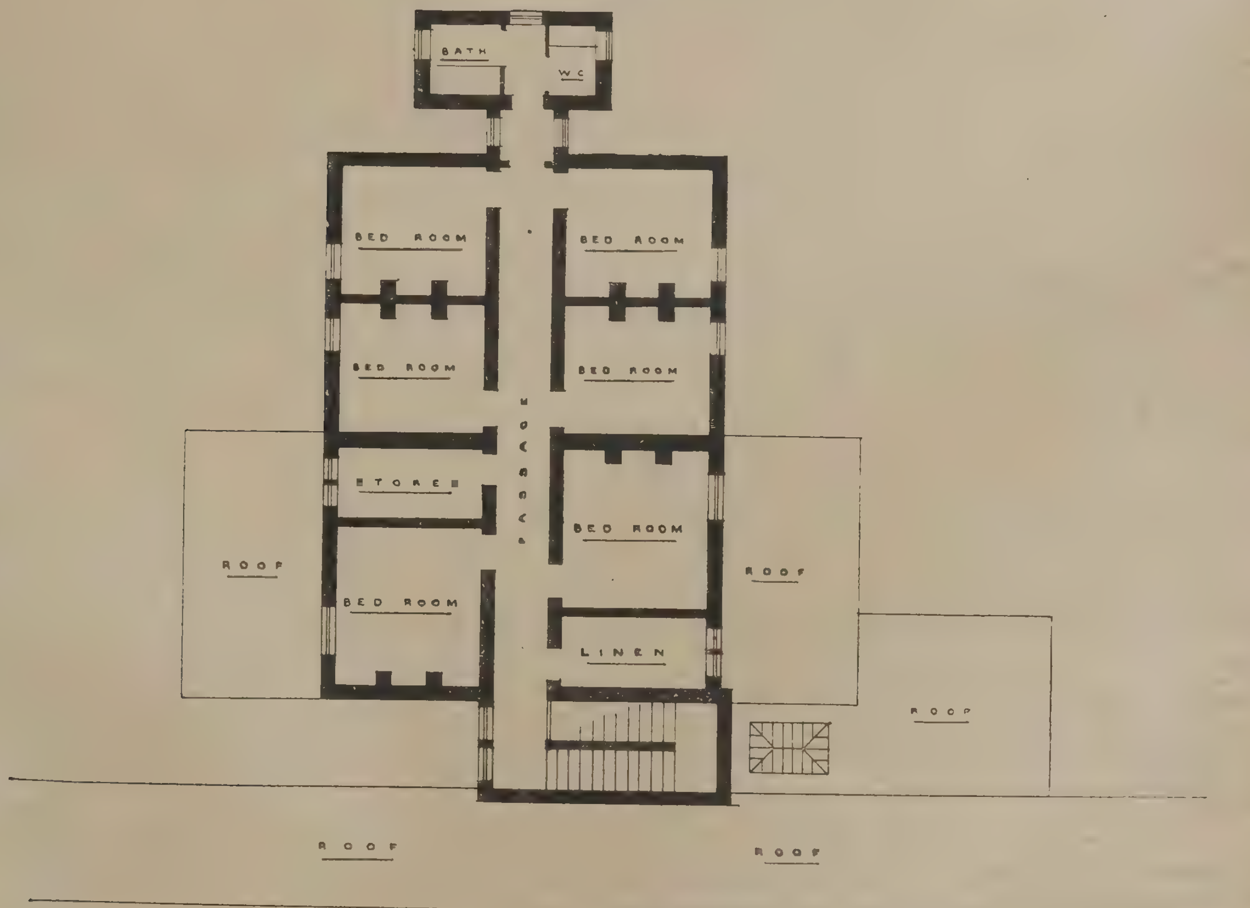

Fig. 48.

patients on such occasions has led to great disasters, and the position of both patients and officials is one of special trouble, having in view the very great difficulty (and at short notice) of placing the former temporarily in a position of safety without the risk of escapes or other mischief arising from the excitement of the moment.

I have in a previous paper given some particulars respecting the hydrants and fire appliances required in an asylum; but, as these are extensive, adequate provision must be made for a spare supply and for necessary repairs. These might either be carried out in a room attached to the fire station, or otherwise. in the fitters' room, usually placed near the general engine-room.

An efficient fire-alarm is an absolute necessity, and the best kind is an electric apparatus, which should be regularly tested and kept in good working condition. One of these should be provided in every ward and every department throughout the institution, and should, if possible, be connected with a steam-whistle or horn, so as to be heard in every direction, and at the same time specially bring up the engineer and fireman.

The fire brigade should be frequently brought out to practice under the direction of the chief engineer, who is usually the official charged with directing operations in the event of an outbreak or alarm of fire.

The great object in connecting the fire-alarm with a loud steam-whistle or horn is to bring assistance from all the available men in the locality, for if the fire be a serious one, it is obvious that the double duty of securing the patients' safety and subduing the fire might prove to be more than the attendants and nurses on duty could accomplish, especially should the outbreak of fire occur during the night.

Great care should be observed that all the water-mains used in connection with the hydrants, both within and without the asylum, be thoroughly well protected from the risk of becoming frozen during winter weather; the fire-pumps should be worked by engines, and should be of ample power to reach all heights of the asylum, and gravitation alone should not be relied upon as a sufficient means of forcing the water to the required elevation.

(*To be continued.*)

THE FRENCH ACADEMY OF FINE ARTS.

THE Académie des Beaux Arts, at its annual meeting on the 19th inst., presided over by M. Ambroise Thomas, awarded the following prizes and medals :—

Painting.—First Prix de Rome, M. Antoine Larée; 1st second Prix de Rome, Paul Albert Laurens; 2nd second Prix de Rome, Jules Guinier.

Sculpture.—First Prix de Rome, M. Hippolyte Roussel; 1st second Prix de Rome, Silvain Salières; 2nd second Prix de Rome, Victor Ségoffin.

Architecture.—First Prix de Rome, M. Auguste Patouillard; 1st second Prix de Rome, Armand Duquesne; 2nd second Prix de Rome, Tony Garnièr.

The Prix Leprince is also awarded to the laureates of the first Grand Prix de Rome in each section of art.

Prix Dechaumes, £60 to M. Blanchard, architect.

Prix Landry is shared by MM. Boverie (statuaire) and Dusquesne (architect).

Prix Bordin, £60 to MM. Defrasse and Lechat, for their work entitled "Epidaure"; a second prize, £20, to M. Clausse, for his work "Basiliques et Mosaiques Chrétiennes"; a third, £20, to M. Fauré, architect, for his "Theory of Proportions in Architecture"; and a fourth prize of the same value to M. Havard, for his publication entitled "Les Arts de l'Ameublement."

Prix Achille-Leclerc, £40, to M. Debat, architect, with honourable mention to MM. Arfridson and Tronchet.

Prix Duc, to M. Josso, architect, with honourable mention to MM. Bauhain and Wable, architects.

Prix Desprey, £40, to M. Loiseau-Pousseau, for a marble statue entitled "Esclave Empoisonnée."

Prix Henri Lehmann, to Mdlle. Elizabeth Sourel, for a water-colour composition, "Le Sommeil de la Vierge."

Prix Bailly, £60, to M. Laloux, architect, for his construction of the church of Saint Martin de Tours.

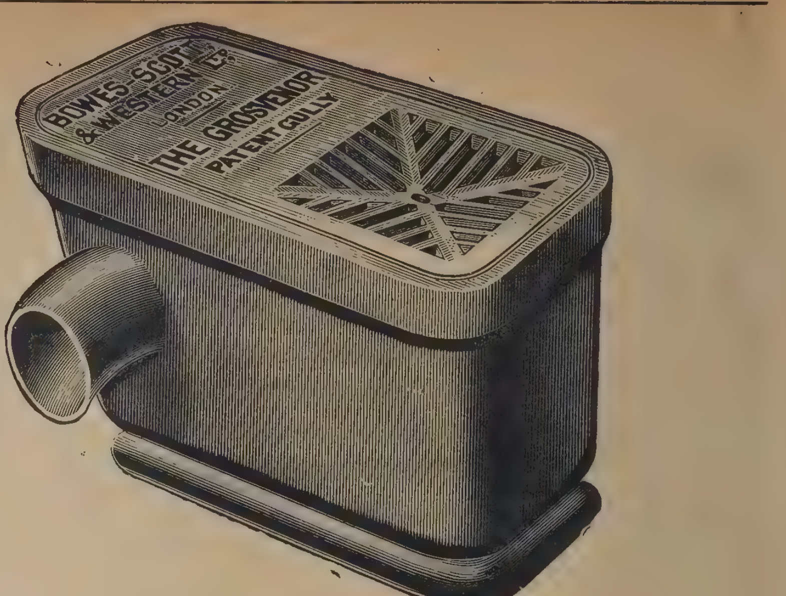
Prix Houllevigne, £200, to M. Nénot, architect, for his construction of the Nouvelle Sorbonne.

Foundation Saintour, £120, to M. Pillet, engraver in medals.

A number of less important prizes and medals in the various sections of art were awarded, and also annual medals to the pupils of the Ecole des Beaux Arts in the sections of painting, sculpture, and architecture.

M. Ambroise Thomas pronounced a short speech, putting forward his praise of the Academy of France at Rome, and the happy influence of the Italian school shown in the work of some of the prize-winners.

The secretary of the Académie, Count Delaborde, read a very interesting notice on the life and works of the sculptor Chapu, the *séance* terminating with the execution of the musical piece entitled "Clarisse Harlowe," which has won for its author, M. Letorey, the first grand prix for musical composition this year.



THE GROSVENOR PATENT GULLY.

THE above illustration represents the Grosvenor Patent Gully of Messrs. Bowes, Scott, and Western, Ltd., Westminster. The gully has been specially designed for receiving surface water, lavatory wastes, yard and stable draining, &c. It consists of a large receiver which can be cleaned out without unsealing this trap, and a special point is that this trap is sheltered, and therefore, should supply of water to gully fail, it will not evaporate so readily as in a gully where trap is exposed. A cleaning eye is provided on outlet to allow obstruction to be removed should such occur between gully and drain.

This gully is in use at a number of H.M. barracks, schools, &c., and should prove of much use to engineers and architects, who are anxious to secure the best and latest gullies for their work.

OBITUARY.

WE regret to announce the death of Mr. DANIEL CUBITT NICHOLS, M.S.A., F.S.I., of the firm of D. Cubitt Nichols and Sons, 3, Howard-street, Strand, a member of the Tribunal of Appeal under the London Building Act, 1894, which occurred at his residence, No. 3, Upper Montague-street, Russell-square, on Thursday in last week. Mr. Cubitt Nichols, who was in his 71st year, was for many years adviser to the Home Office in relation to the Artisans' and Labourers' Dwellings Act, 1875, and other matters, and was surveyor to several large London estates. He joined the Surveyors' Institution in January, 1875, as a Fellow, and was a member of Council at the time of his death. He has also been a member of the Society of Architects since 1886, and had served upon its council. He was formerly an Associate of the Royal Institute of British Architects, but withdrew many years since.

THE death is announced of Mr. HARRY G. W. DRINKWATER, F.R.I.B.A., of 2, St. Michael's Chambers, and 8, New-road, Oxford, who died while staying at Wokingham on professional business. He was a pupil of the late Mr. G. E. Street, R.A., and in 1873 he gained the Royal Academy Medal for measured drawings of the tomb of Aylmer de Valence at Westminster Abbey; these were given on two sheets of photolithographs in the BUILDING NEWS for August 22, 1873. He had carried out many works in Oxford, including the new theatre. He had been a member of the London Architectural Association for nearly 30 years, and a Fellow of the Royal Institution of British Architects for the past 13 years. For many years he was churchwarden of St. Philip and St. James's, Oxford, and his professional advice was always at the service of the various societies of which he was a member, especially of the Central Church Schools Council, and of his own parish in particular, where he was secretary and treasurer of the schools and a trustee of the parish institute.

MR. J. W. TREW, until recently head of the firm of J. W. Trew and Sons, architects and surveyors, of Broad-street, Bristol, died, of paralysis, after a long illness, on Friday, the 18th inst., at Poole, Dorset, at the age of 72. Mr. Trew had retired from business some two years, being one of the older practitioners in Bristol, and some 25 years ago laid out and superintended the erection of Russell Town, now an important suburb of Bristol, and other large building estates at Moorfields, Redfield, St. George, and Brigstocke Estates were also laid out by him, and latterly the board schools at Windmill Hill and Temple Back were erected from the firm's designs, as also the Brunswick Schools and Lecture Hall, and similar buildings in and around Bristol. The business will be continued by his sons at 22, Broad-street, Bristol, by Mr. A. R. F. Trew, M.S.A., and at Gloucester by Mr. J. Fletcher Trew, M.S.A., architect and civil engineer.

ON Saturday afternoon, Mr. JOHN SUTTON, 50 years of age, one of the best-known architects in Southport, was found dead in Mr. Iddon's warehouse, of London-street, with the top of his head blown off, and a double-barrelled breech-loading gun, with one barrel loaded, by his side. At the inquest, held on Monday, an open verdict was returned, the evidence not conclusively pointing to accident or suicide. Deceased, a native of Southport, was articled in the office of the late Mr. Mellor, architect, of Sutton, and became his partner in a very lucrative series of undertakings, a connection which lasted until the death of Mr. Mellor. Along with his partner, deceased was joint architect of the Southport Market Hall, St. Luke's Church, Southport, and the conservatory of the Botanic Gardens, Churchtown. Since his partner's death, he had acted as joint architect of the church of SS. Simon and Jude, High Park, Southport, and of the schools in Wennington-road, opened in 1893, and had carried out many private works. A man of great activity, he had been for some years past the vicar's warden at Holy Trinity Church, Southport, and he held various offices in the Masonic body. Some extensions in connection with Trinity Church now in progress had engaged his attention lately, for he had virtually retired from work for profit. For many months his health had given rise to anxiety—indeed, he suffered from a wasting malady that must have ended fatally. He leaves a widow and family.

CHIPS.

A new seaside resort is about to be created on the Yorkshire Coast at Sandsend, at the mouth of a ravine eastwards of Mulgrave Woods. The Marquis of Normanby, who is the owner of the estate, has appointed Mr. E. H. Smales, architect, Whitby, to act for him in the selection and laying-out of building sites, and the commencement of the building operations.

The foundation-stone has been laid of an annexe for idiots and imbeciles at the Middlesex County Asylum, Wandsworth Common. The additions, which include the increase of the accommodation from 1,080 to 1,484 beds, remodelling of the laundry arrangements and workshops, will entail an outlay of £99,500. Mr. Rowland Plumbe, of Fitzroy-square, is the architect.

The custodians of the Truro Cathedral Building Fund report that the amount available for a recommencement of the building of the cathedral is now £12,812 2s. 3d.; but no mention is made whether it is proposed in the immediate future to resume operations.

The erection of the higher grade school which is to be established at Bethesda, Carnarvonshire, under the provisions of the Intermediate Education Act for Wales was commenced on Tuesday. The contact, which approximates £3,000, has been let to Messrs. Hughes and Sterling, Liverpool, Messrs. Willink and Thickness, of that city, being the architect. The site, with £200, has been granted by Lord Penrhyn.

(See descriptive article and further sketches on page 587.)

WEST HAM TECHNICAL INSTITUTE AND PUBLIC LIBRARY.

Having illustrated each of the three premiated designs for this building, we do not propose to publish all the schemes submitted in the recent competition. We have, however, chosen the accompanying view of the design contributed by Mr. Sydney B. Beale as a striking illustration among the best displayed at the exhibition. His plan, too, seems to possess points which are both suggestive and well thought out.

VIEW OF WESTMINSTER FROM YORK BUILDINGS, FROM A DRAWING BY CANALETTO.

(See description on page 612.)

ARBROATH PARISH CHURCH.

The church, while nominally a restoration of the old parish church of Arbroath, erected in 1591 and destroyed by fire in 1892, is, practically speaking, a new building attached to the old spire. The site is an irregular one, at the corner of Hill-place and West Abbey-street, with an open frontage on three sides, and in close proximity to the old abbey buildings. The plan is the result of the large number of seats required in so small and irregular a piece of ground. It consists of a nave, 76ft. by 35ft., with double transepts and a chancel-aisle to the north. Galleries are placed in the double transept, and the magistrates' gallery occupies the upper part of the chancel-aisle, the lower part being designed as a session-house; but so arranged that it may be utilised for church purposes if necessary. The minister's vestry is placed on the ground-floor of the old tower, formerly the entrance to the church; the main entrance now being through the open porch at the corner of West Abbey-street and Hill-place. Internally every effort is made to emphasise the length of the nave. The walls are lined with wood to the height of the gallery fronts, and the unbroken line of the cornice passes round the church, rising only at the organ, which covers the west gable. The style of the work is the Scotch adaptation of Early English, common to the old Abbey of Arbroath and other Scotch ecclesiastical buildings; but owing to the limited cost, the aim has been to secure largeness of effect rather than richness of detail. The walls are built of local red sandstone, and the interior, with the exception of the piers and arches, is finished in rough plaster. The contractors for the work are Mr. Andrew Fife, mason; Mr. David Farquhar, joiner; Mr. Wm. Brand, slater; Mr. G. A. Campbell, plasterer; Mr. Joseph Anderson, plumber; Mr. James Keith, heating and ventilation, and the sum of their contracts amounts to about £7,000. The clerk of works is Mr. Dalzell. The east window of nave is to be filled with painted glass, designed by Sir Edward Burne Jones. The architects are Messrs. John Burnet, Son, and Campbell; and the drawing is from this year's Royal Academy Exhibition.

THE PASSMORE EDWARDS COTTAGE HOSPITAL, TILBURY.

This building, the foundation-stone of which will be laid to-morrow, is the gift of Mr. J. Passmore Edwards to the labouring population of Tilbury and Grays. The site for the hospital has been given by the joint committee of the London and India Docks. The entrance is placed in the centre of the principal front, and communicates with the hall, from which a well-lighted corridor runs right and left to the wards. The accommodation consists of a surgeon's room, 15ft. by 12ft., with dispensary adjoining; matron's room, 15ft. by 12ft., with nurses' sitting-room adjoining; two single wards, each 12ft. by 10ft.; and two three-bed wards, each 21ft. by 15ft. A building two stories high is placed in the rear of central hall, containing kitchen and offices on the ground floor, and matron's, nurses', and servants' bedrooms on the first floor. This block is connected with the main building by means of a cross-ventilated lobby, every effort being made to separate the residential part of the building from the hospital proper. Each wing is provided with a sanitary pavilion, connected with the main corridor by a cross-ventilated lobby, and the building is so arranged that one half can be used as a male wing and the other half for females, the corridor being divided by a screen framing. Each pavilion contains a bath-room, sink, lavatory, and w.c. The building is faced with red brick and Bath stone dressings, and the roof is covered with green slates. The architect is Mr. Rowland Plumbe, F.R.I.B.A., 13, Fitzroy-square, W.; and the builder Mr. J. Brown, Grays, Essex.

◆

It has been decided to erect an oak chancel screen in St. Mary's Church, Halifax, as a memorial to the late Major Stocks, a well-known archæologist.

The church of St. Elfrida, Llansaintfread-in-Elvel, Radnorshire, having fallen into ruin, a new church is being built on the same site and on the same general lines as the old one. Parts of a fine oak roof of 14th century date with cusped wind braces will be refixed in the new roofs, which are, however, identically the same design as the old ones. The new church is being built with local stone walling and sandstone dressings from designs and under the superintendence of Mr. F. R. Kempson, of Hereford and Cardiff. The old oak has been utilised in making the seats, the old bells will be rehung and the altar refixed, window tracery and some monuments will be refixed. The contractor is Mr. John Price, of Builth.

Twelve months ago the Mayor of Hanley promised a fountain for the Cauldon Grounds section of the public park in that town, the base and ordinary outline of which were designed by Mr. Mawson, in consultation with Mr. S. J. Cartlidge, of the Hanley School of Art. The fountain was executed in red terracotta at Messrs. Doulton's works at Lambeth. Mr. Rowland Morris, who carried out the decoration of the Wedgwood Institute, Burslem, was selected to execute the modelling, and his work has been completed by Messrs. W. T. Copeland and Sons, of Stoke. The late Mr. R. F. Abraham, art director, manifested much interest in the production of the work. Four griffins with outspread wings will be placed upon the plinths projecting from the central column of the fountain, the material being a special clay of a fawn-grey colour, having a smear glaze.

New co-operative baking premises at Cramlington were opened on Saturday. The buildings consist of a bakehouse 32ft. by 33ft., confectionery room 19ft. 6in. by 12ft., cooling room 18ft. by 14ft., engine room 9ft. by 14ft. Two ovens and firing passage occupy a space of 22ft. by 22ft. On the first floor is a flour warehouse, directly above the bakehouse. The ovens consist of a double pile of Jennison's hot-air smokeless ovens, and a double pile of Mason's continuous hot-air smokeless ovens, together with hot-water supply and steam prover. The contractors for the buildings are Messrs. Dixon and Simmons, Cramlington; plumbing and gas fitting, Mr. Arthur Scott, Grafton-road, Heaton. The work has been carried out from the plans of Mr. John Crone, architect, Granger-street, Newcastle-on-Tyne.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Northern Architectural Association.—The members of this association had an excursion to Sunderland on Saturday, where various buildings were visited. The party included the president, Mr. J. Oswald, of Newcastle; the hon. secretary, Mr. Arthur B. Plummer, Newcastle; Messrs. J. H. Morton, R. H. Morton, J. M. Dingle, J. W. Donald, and H. Grieves, of South Shields; Stephen Piper, H. Charlewood, J. Graham, J. Bruce, H. Cayley, M.A., C. T. Marshall, R. B. Dick, C. S. Errington, W. Sheriff, and W. W. Oliver, of Newcastle; S. M. Mold, Gosforth; G. Brumell, Morpeth; Frank Caws, G. T. Brown, and J. Spain, of Sunderland. The members met at Monkwearmouth Station, and proceeded thence in brakes. The ancient parish church of Monkwearmouth (St. Peter's) was the first place visited, the party being shown over the sacred edifice by the vicar. Messrs. Thompson and Co.'s (ship-builders) joiners' shops, for which Mr. Frank Caws was the architect, were next inspected, and the members then proceeded to view the new board schools in Chester-road. The architects (Messrs. Oliver and Leeson, Newcastle) were represented by Mr. Graham, who acted as guide to the party. St. Hilda's Church, in the same district, for which Messrs. Hicks and Charlewood, Newcastle, were the architects, was also visited, as were also the Eye Infirmary (Mr. J. W. Donald, South Shields, architect) and Langholm Tower. The architect for the latter was Mr. W. Milburn, of Sunderland. The members lastly visited the Church of St. Ignatius the Martyr, the gift to Sunderland people of the late Bishop Lightfoot, where the vicar kindly acted as guide.

◆

CHIPS.

A collection of 17 photogravures, by the Berlin Photographic Company, of the famous Rembrandts in the Cassel Gallery, has now been mounted and framed, and placed on a screen in the long picture room at the Municipal Art Gallery, Birmingham.

The foundation-stones were laid on Friday of a new Baptist church and school premises in Lancaster. The plans provide for a church, Gothic in style, with provision for 450 worshippers. Schools and a lecture-room are to be erected at the rear, the main room measuring 52ft. long by 33ft. The estimated cost, including site, is £5,000.

At an informal meeting of the Dewsbury Town Council, it has been unanimously resolved to request Councillor George A. Fox (of the firm of Holtom and Fox, architects, Dewsbury) to accept the office of mayor for the ensuing year. This he agreed to do. Mr. Fox has designed, with his partner, many fine public buildings, among them the town halls of Dewsbury, Burnley, and Nelson.

Sir Henry Doulton, whose firm have branch works at St. Helens, Lancs, has offered to present to Victoria Park, in that town, a fountain of terracotta. The fountain, which will be expressly designed for the site, will be about 15ft. in height, and have a fountain 15ft. in diameter. The corporation of St. Helens have accepted the offer with thanks.

Two wings have just been added to the infirmary at Bradford, and were formally opened on Tuesday. The extension comprises three observation wards, a room for night cases, additional rooms for nurses, a mortuary, a room for post-mortem examinations, and kitchen. The architects for the new wings were Messrs. Milnes and France, and the cost has been over £6,000. The contractors were: Masons' work, Mr. Wallace Daykin; joiners, Messrs. T. Taylor and Sons; and plumbers, Mr. Charles Nelson.

The proprietors of Redheugh Bridge, connecting the western districts of Newcastle and Gateshead, have been informed by the county authorities that the structure is unfit for heavy traffic. The bridge, one subject to a toll, was designed and built by Sir Thos. Bouch. It was commenced in 1868, and finished in 1871, at a total cost of about £53,000. It consists of two longitudinal wrought-iron lattice girders, each 838ft. long and 22½ft. high, supported on three river piers, each of which consists of four cast-iron columns. The length of the bridge is 1,453ft., and water-mains and gas-mains are carried across the structure. The owners have now to choose between the unpleasant alternatives of spending about £30,000 over repairs, or £70,000 over a new bridge.

The City Commissioners of Sewers decided on Tuesday to widen the eastern end of Widegate-street at a cost of £14,000, provided the County Council will contribute a moiety of that sum, and to widen the entrance to Great St. Helen's at a cost of £1,900.

CROWNS OF GOTHIC KINGS. (7th CENTURY.) FROM THE CLUNY MUSEUM.

(*From a Photograph by* M. Robert.—See May Morris's Article on p. 585.)

VIEW OF WESTMINSTER BRIDGE FROM YORK BUILDINGS.

BY the courtesy of Mr. J. P. Haseltine we are enabled to present our readers with a reproduction of a water-colour drawing by Canaletto, exhibited at the recent Exhibition of Objects of Italian art in the New Gallery, Regent-street. The original drawing is in Indian ink and bistre, slightly heightened by colour, with a charming luminous atmosphere, the delicacy of which is necessarily impossible to obtain in any reproduction. The purity of the lines and the rare fidelity of drawing are, however, represented with remarkable success. Antonio Canal, commonly known as Il Canaletto, was born at Venice, Oct. 18, 1697, and died in his native city, Aug. 20, 1768. The son and pupil of Bernardo Canal, a scene-painter, he at first followed his father's profession; but on visiting Rome in 1719, when he was in his twenty-third year, he began to study from nature, and rapidly acquired a reputation as a skilful landscape painter. On his return to Venice he applied himself to depicting the picturesque palaces, churches, and canals of his birthplace. His most famous picture, "A View on the Grand Canal," is in the Louvre. Horace Walpole informs us that Canaletto came to England in 1746, when he was about fifty years of age, by the persuasion of his countryman, Amiconi, and encouraged by the number of pictures which that artist had sold in this country. Canaletto was then in good circumstances, and it was said came over here to invest his money. Walpole thinks that he did not remain in England more than two years; but in this he is mistaken, as it appears from an advertisement that he was living in lodgings in Silver-street, Golden-square, in 1752. The advertisement sets forth that "Signior Canaletto . . . . had painted Chelsea College, Ranelagh House, and the river Thames, which if any gentleman or others were desirous to see, he would attend at his lodgings at Mr. Viggan's, in Silver-street, Golden-square, for fifteen days from July 31, 1752." ("Lond. Past and Present," III. 248.) It will be seen from our illustration that Westminster Bridge was in course of construction at the time Canaletto made his drawing, and this circumstance fixes approximately the date of the view. The first stone of old Westminster Bridge was laid on the 29th January, 1739, and the last stone on the 10th November, 1750; the time occupied in the building being thus eleven years and nine months. The bridge consisted of thirteen segmental and two small semicircular arches, and cost £218,415. The bridge in the drawing appears to have been about half-finished, and this will determine the date of the picture at about the spring of 1745, which corresponds with Walpole's statement as to the year of Canaletto's arrival in England. There is a print in the Crace Collection, dated 1747, which appears to have been taken from this drawing. It is described as "The South-East Prospect of Westminster Bridge," looking westward, the City Companies' barges going to Westminster. Canaletti pinxit. Wale del. Parr sculp. 1747, 23 by 18. (Cat. Crace Coll. 1879, No. 496.) The house on the extreme right of the drawing is No. 15, Buckingham-street, where the late William Burges, A.R.A., had his offices, now in the occupation of the Charity Organisation Society, which was occupied by Peter the Great in 1698. York Water Gate, at the southern end of Buckingham-street, was erected about 1626, from the designs of Inigo Jones, for George Villiers, first Duke of Buckingham. Villiers obtained from James I. a grant or lease of the mansion in the Strand formerly belonging to the Bishops of Norwich, and the gate was then constructed in the long, embattled wall skirting the river. The Duke of Buckingham pulled down York House and erected a large temporary structure in its place, the walls of which he adorned with mirrors, and purchased, besides, Rubens' collection of pictures and statues to embellish it. In the garden was John of Bologna's group of Cain and Abel, which was given by the King of Spain to Charles I., and by him presented to the Duke. York House was sold in 1672, and was pulled down, and the present streets formed on the site. York-buildings is the general name for the streets on the site of York House; but this name is now restricted to one thoroughfare, which was originally named George-street. There appears to be no doubt that York House water-gate was designed by Inigo Jones, and not, as was suggested by the late Wyatt Papworth, by Nicholas Stone. There is a drawing of the gate in the collection of drawings by Inigo Jones belonging to the Duke of Devonshire, deposited in the library of the Institute. Nicholas Stone was a mason, although he seems to have also practised as an architect, Cornbury, in Wiltshire, having been designed by him. He was frequently employed by Inigo Jones, and appears to have carried out the masonry of York Gate, and to have carved one of the lions. The gate appears to have been suffered to fall into a state of decay soon after Canaletto made his drawings, as appears from an Act of Parliament passed in 1754, to enable the proprietors and inhabitants of houses in York-buildings to levy a rate among themselves, not exceeding sixpence in the pound, to rebuild or repair the terrace-walk and water-gate. The preamble of the Act recites that the terrace-walk and water-gate are "so greatly gone to ruin and decay, that it will require a considerable sum of money to rebuild or repair the same." It seems incredible that the gate should have fallen into such a state of disrepair so soon after Canaletto's drawing was taken, as is indicated by the preamble to the Act. The roof, which in all probability was a flat roof, covered with lead, appears to have been destroyed, and was replaced by a pantiled roof of a low pitch. The gate is now vested in the London County Council, who are about to put it in repair. The lofty structure shown in the picture, adjoining York water-gate, is the water-tower of the York Buildings Waterworks. In 1691 a company was formed called the York Buildings Waterworks Company, for supplying a part of Westminster with water pumped from the Thames at a point near Charing Cross. These works flourished for some time, but failed from competition with the more copious supplies afforded by larger companies, notwithstanding many important improvements introduced by Rennie, the eminent engineer. In 1818 the works were leased by the New River Company, and in 1829 the company was dissolved, and the works abolished. The water-tower, which appears to have been covered externally with wood shingles, was a very picturesque object, and shows how effective a mere utilitarian work can be made if there is no attempt to conceal or ornament it. Westward of the water-tower is a wharf with lofty buildings stretching away to Westminster. In the centre of the picture is Westminster Abbey, the front of Westminster Hall, the towers of St. John's Church, Westminster, then Westminster Bridge, and on the extreme left Lambeth Palace.[*] We are indebted to Mr. John Hebb, F.R.I.B.A., the Assistant Architect to the London County Council, for the above interesting information respecting the subject represented by Canaletto's drawing.

Mr. Francis N. Mundy, of Markeaton, has presented about 8½ acres of land, worth £8,000, to be devoted to recreation purposes for the town of Derby. He has also sold to the corporation, at half its value, sufficient land to form a thoroughfare between two detached portions of the town, thus saving a journey of nearly two miles by a circuitous route. There is a stream adjacent to the land, and it is intended to utilise this for public baths. The total outlay of the corporation will be between £8,000 and £9,000. Two bridges have to carry the road over the stream, and on Tuesday a memorial-stone was placed in each by the Mayor of Derby.

The chapel of Selwyn College, Cambridge, was dedicated on Friday by the Bishop of Ely. Since the foundation of the College in 1882 the services have been held in a temporary building. A permanent chapel has now been erected from designs by Sir Arthur Blomfield, A.R.A., the sum expended being £11,000. Messrs. Cornish and Gaymer, of North Walsham, were the contractors. The style is Early Perpendicular, and the work is carried out in red brick with Portland stone dressings, all the fittings being of oak. The chapel is 93ft. 6in. long by 27ft. wide, and 58ft. in height. The east window is filled with stained glass, designed by Mr. C. E. Kempe. The furnishing includes a carved western screen, with three canopied stalls on either side of the doorway, 22 stalls with canopies, on the north and on the south sides sub-stalls, and a third row of benches below. The stalls will seat about 160 persons. The lectern, a replica of the ancient one in Southwell Cathedral, is the gift of the Rev. William Selwyn, and the bell is given by the Right Hon. W. E. Gladstone.

Engineering Notes.

Weardale Extension Railway. — The new Wear Valley Extension Railways from Stanhope-in-Weardale to Wearhead, a distance of about 9½ miles, was formally opened on Tuesday. The extension, a branch of the North-Eastern system, has been constructed at a cost of £64,872 in exactly two years. The chief contract for the new line was let to Mr. J. T. Firbank, M.P., of London; the building and architectural work to Mr. R. Kitching, of Darlington; the signalling machinery is that of Messrs. Stevens, of London; and the laying of the rails and permanent way has been under the direction of Mr. W. J. Cudworth, the divisional engineer of the North-Eastern Railway, assisted by Mr. E. W. Lyall, of Darlington, the latter gentleman having been connected with the inception of the line and with the survey. Starting at a junction with the old line at Stanhope, the line proceeds, going westward up Weardale. The station buildings at Stanhope and St. John's have platforms 150 yards each long, whilst the platforms at Eastgate and Westgate-in-Weardale have platforms 100 yards each long. A new station has been built at Stanhope, but the old one will be continued in use for goods and mineral traffic. The line gradually ascends from Stanhope to the terminus, the average ascent being about 1 in 100, and the sharpest near St. John's Chapel, where it is 1 in 75. It is a line of many bridges, there being a score of these between the termini. Three are over the river Wear, one being a bridge of two spans of 75ft. near Stanhope; a second at Craig Nook, above a mile farther on; and a third near Eastgate. The remainder of the bridges are over roads and small streams. The Wear itself has needed diversion and the formation of an embankment. There have been needed some 126,000 cubic yards of earthwork; but the line has been planned so as to avoid deep cuttings, and thus it is mainly a surface line, with slight cuttings and embankments. In the quarrying of limestone and of the whinstone which is so abundant all along the course of the railway; in such lead-working as may be profitable; and in agricultural industry are the present hopes of the dale. Tourist traffic will, in all probability, be largely developed.

CHIPS.

A new pavilion, which has been erected in connection with the Aston Infectious Diseases Hospital at Witton, was opened on Friday. The new building, which, exclusive of the site, has cost about £1,000, will accommodate twelve scarlet-fever patients.

The City Court of Common Council have decided to place a marble bust of the Duke of Cambridge in the Guildhall.

New Catholic schools are being erected at Maindee, Mon., and special consideration has been given to the ventilation, which will be carried out on the Boyle system.

A once-notorious haunt of criminals will vanish with the old buildings which are about to be swept away in Newton-street, W.C., for the extension of the King's Hall. By a custom prevalent in the days of Tyburn, the malefactors here resident used, when a condemned *confrère* passed along Holborn *en route* to the gallows, to present him with a bouquet of flowers.

The equestrian statue which was unveiled on Saturday by the Emperor William on the battlefield of Wörth represents the late Emperor Frederick in field uniform and cap pointing and looking westwards, his horse stepping on the rocks which form the foundation of the monument. The rocks of the pedestal are decorated in front with the combined arms of Alsace-Lorraine, surmounted by an eagle, and in front also stand two old German warriors with hands clasped together, representing the united troops of North and South Germany. The sculptor is Herr Baumbach, of Berlin.

The Roman Catholic Church of the Holy Redeemer in Cheyne-row, Chelsea, was consecrated by Archbishop Vaughan on Tuesday. It is Italian Renaissance, and is of red brick, with Bath stone dressings and a lead-covered roof. The length is 115ft., and the width across nave 34ft., the height being 42ft. Mr. Edward Goldie, of Kensington, was the architect, and Messrs. Goddard, of Farnham, were the builders.

The Water Committee of Arbroath Burn Commission decided on Monday to instruct Mr. Wilson, C.E., Edinburgh, to look out for a gravitation supply of water, and to ascertain its probable cost, together with the probable quantity and quality.

---

[*] In the National Gallery, No. 1328 is a view of York Gate, the Water Tower, and Westminster Abbey and Bridge, by Samuel Scott, the marine painter, who died in October, 1772; the bridge is shown as completed, the foreground and river surface are more carefully rendered, and some of the architectural details are more faithfully portrayed, but the general result is to confirm Canaletto's observations in every particular. Scott's picture was purchased from the Wheeler bequest in 1891.

Building Intelligence.

Ashton-upon-Ribble.—Owing to the increased population of this part of Ashton, the existing schools have proved for some time to be quite inadequate. Extensive additions are now being carried out from the designs of Messrs. Myres, Veevers, and Myres, architects, of Preston, &c., and comprise a large room. The internal dimension of the building is 77ft. 6in. by 24ft., and 16ft. high to the ceiling. The roof will be open-timbered, carried by six curved and braced principals, supported by moulded stone corbels. Galleries and the usual school fittings will be provided. The main school will give accommodation for 116 extra scholars, and when used for entertainments, concerts, &c., will seat over 360. Attached are roomy porches, cloak-rooms, with lavatories. The total amount of the contract is £1,272. The buildings are being carried out under the personal supervision of Mr. T. Harrison Myres, F.R.I.B.A.—The corner-stone has also been laid of St. Andrew's school, Ashton-upon-Ribble. The managers have had many schemes before them, but have secured a design from Messrs. Myres, Veevers, and Myres, architects, of Preston, now being carried out. The new school is intended for the boys (the girls and infants occupying the whole of the old buildings). The school is being built of Haslingden parpoints, lined with brick, and in style to harmonise with the adjoining buildings. The main school will accommodate about 212 boys; the total amount of the contract being £1,581. The buildings are being carried out under the personal supervision of Mr. T. Harrison Myres, F.R.I.B.A.

Cambridge.—The new collegiate buildings for the Cambridge Training College for Women Teachers was opened on Saturday. The new college is situated in Wollaston-road, overlooking the University cricket ground. The cost so far has been over £10,000; but, in addition to a deficit of over £1,000 in the building fund, a further sum of £2,000 is required to build the east wing, in order to make complete provision for the staff and 50 students, to which number the college is limited. The building is carried out in red brick with terracotta dressings, and red tiles are used for roofing. The lecture-room and library are located on the ground floor, and the dining-hall, kitchen, and offices on the first floor. The architect is Mr. W. M. Fawcett, M.A., F.S.A. We illustrated the college by a plan and perspective in our issue of August 3, 1894.

Chichester.—A county lunatic asylum for West Sussex is in course of erection about a mile from this city, from plans by Sir Arthur W. Blomfield, A.R.A., and Son. The executive buildings stand in a block in the centre of a series of six blocks for the reception of the patients; the latter blocks are to be connected by underground corridors. The chapel is to cost £4,000 out of £114,669, the amount of the contract. The total expenses will probably be nearer £200,000, but the original estimate was far in excess of the latter figure. Water had been found at a depth of 400ft., and a water-tower some 100ft. in height will serve the buildings. The asylum will accommodate 450 patients, and is capable of being extended to receive another 150. Up to the present time the asylum at Hayward's Heath, in East Sussex, has been the only one in the county.

Lincoln.—The new church of St. Faith, which has been erected in Charles-street to meet the growing needs of the western part of the parish of St. Mary-le-Wigford, was consecrated by the bishop on Tuesday week. The church is 15th century in style, consisting of nave, chancel, and broad aisles the full length of the building, under three high-pitched roofs without chancel arch or other cross arches. It has been built of red brick, supplied by Messrs. Handley and Son, of Lincoln, with exterior dressings of red Dumfries stone, while the interior dressings are of Ancaster stone. It has a nave 57ft. 9in. by 25ft.; chancel, 32ft. 6in. by 25ft.; and aisles each 80ft. by 15ft., and affords accommodation for about 530 worshippers. The west façade of the church has a central window of six lights, with one of three lights to each aisle, while the aisle windows are of four lights each. The east window is of five lights. The roofs are all panelled under the rafters. The only permanent fittings at present provided are the altar, chancel-screen of oak, and choir-seats. The whole of the works have been carried out by Messrs. E. Bowman and Sons, of Stamford, from the design of Mr. C. Hodgson Fowler, F.S.A., of Durham, Mr. W. S. Goodbarne being clerk of the works. The cost has been £5,000.

Llanthony.—The parish church of St. David was reopened after restoration last week. The church is situated amid the Black Mountains, and within the precincts of old Llanthony Abbey, with which it is contemporary. It consists of nave 52ft. by 19ft., chancel 34ft. by 15ft., and north porch, and is about four miles from the monastery of Father Ignatius. The glory of the building is the nave roof; it consists of eight pairs of principal rafters, carrying two purlins on each side, supporting 56 common rafters and double-ridge pieces. The roof has been stripped. The timbers have been restored, then strengthened with iron plates, straps, and bolts, and covered with boarding felt, and the old stone tiles replaced. The floor of the nave has been lowered so as to get a step at the chancel arch; but it is still 18in. above the original floor-line, which could not be maintained. A bed of concrete has been laid over the whole area of nave, and the modern seats, pulpit, and ancient font have been refixed. The internal plaster has been retained. A small new window has been inserted in the north wall to give light to the pulpit. All the windows have new leaded lights, and a new oak door for the north entrance has been provided. The iron furniture, such as hinges, hooks, latch, ring, handle, and straps, are the entire work of Mr. Howells, the village smith, who has just entered his 76th year, was born in the Abbey Tower, and educated in the old parish church. The building is heated by one of Musgrave's stoves. Moulded eaves, gutters, square down-pipes, gullies, and drains have also been provided. The outlay amounted to about £700. The first portion of the work was executed by Mr. Pritchard, and the second contract by Messrs. Denham and Sier, Abergavenny. The work has been carried out from the plans, and under the personal superintendence, of Mr. J. James Spencer, architect, Abergavenny.

Newcastle-on-Tyne.—The printing premises, which have been erected for the Co-operative Printing Company at the corner of Rutherford-street and Bath-lane, were opened on Saturday. The building has been erected from designs prepared by Mr. F. W. Rich, of Eldon-square, Newcastle. It occupies a site containing 800 square yards, is six stories high, and is constructed of brick, with stone dressings, light being provided to the various rooms and shops by broad windows. The building is lined throughout with cream-coloured glazed bricks. The building is practically fireproof, the floors being constructed of cement concrete and steel girders, and finished with wooden blocks. The rooms and shops throughout are warmed by a system of low-pressure hot-water piping. Cellarage and paper stores are provided in the basement, and also the engine for driving the machinery. On the ground floor the sale shop is situated, together with a large paper store. The entrance to the workshops is by a separate staircase, which is also fireproof. The cart entrance and loading dock are in connection with the paper store. The first floor is occupied by the printers, who have a shop 48ft. by 46ft., and here also are the board-room and offices. The second floor forms a bookbinding shop, 64ft. by 48ft., and the third floor a composing shop, 64ft. by 50ft. A lift connects the whole of these floors, and also a paper shoot. At the corner of the site a dome, 24ft. square, rises to the height of about 100ft. above the pavement, and forms a conspicuous feature in the neighbourhood. The building is lighted with electricity. The contractors for the building were:—Masonry and joiner work, Messrs. J. and W. Lowry; slating, Messrs. Hewitson; plumbing and heating, Messrs. Walker and Son; cement flooring, Messrs. W. B. Wilkinson and Co.; painting, Mr. G. G. Laidler; electric lighting, Messrs. W. H. Holmes and Co., all of Newcastle.

Newlyn.—Mr. Leonard Courtney, M.P., opened on Monday an exhibition of pictures in the Opie Memorial Art Gallery, which has been erected by Mr. J. Passmore Edwards at Newlyn, near Penzance, for the use of the artists living there. The main portion of the building is devoted to the gallery, which measures 45ft. by 25ft. and 15ft. from the floor to top of the cornice, an extensive wall-space being thus available for pictures. On the same floor is an ante-room, the rest of the space being utilised as a landing opening out from the porch. In the basement are the reading-room, committee-room, and caretaker's apartments. We illustrated the gallery, of which Mr. James Hicks, M.S.A., of Redruth, was the architect, and Messrs. John Symonds and Sons, of Blackwater, were the contractors, in the Building News for Feb. 8 of the present year. An excellent collection of pictures has been brought together for the inaugural exhibition, and, although many of the works have been seen in previous exhibitions, they are new to the majority of West-country folk. It is essentially a Cornish show, most of the pictures representing Cornish scenery or Cornish life. The central position is given to Sir Frederic Leighton, P.R.A., who has contributed five studies, one of a female head entitled "Vittoria," the others sketches from Kynance. Mr. Stanhope Forbes, A.R.A., and Mrs. Stanhope Forbes, Mr. Frank Bramley, A.R.A., Mr. George Clausen, A.R.A., Mr. and Mrs. T. C. Gotch, Mr. Norman Garstin, Mr. Chevalier Tayler, Mr. Napier Hemy, and Mr. H. S. Tuke are among the other artists represented. Speaking at the luncheon, over which Mr. Bolitho, M.P., presided, Mr. Courtney said he was to represent for the moment Mr. Passmore Edwards. They were both Cornishmen. The Newlyn colony of artists had become known in the world: they were a school; they already had traditions. This Newlyn School wanted the assistance of a gallery in which its annual production might be seen, and where visitors to the West of Cornwall might go and discover what they were producing year by year. He was proud, as a Cornishman, that this Newlyn colony had come amongst them. He hoped they would develop in Newlyn itself a school of natives who would be a credit to those who taught them, and maintain the Newlyn School, which, though enriched from without, should also furnish from within a school for the production of Cornish artists, as well as a school in which Cornwall gave a home to artists from other parts of England.

Scunthorpe.—Under the direction of the Lindsey County Council, a new court-house, superintendent's residence, sergeant's house, cells, and stables have been erected at Scunthorpe. The site adjoins the old police-station, which has not been interfered with. The entrance to the court-house is flanked on either side by the justices' retiring-room, 15ft. square, and the witnesses' room, 15ft. by 13ft. The court-house is 55ft. by 25ft., and height to ceiling 22ft. The walls are panelled to dado height. The bricks were supplied by Messrs. Spring and Halmshaw, of Saddlethorpe, and the stone dressings from the Ancaster quarries. The ventilating apparatus has been supplied by Messrs. R. Boyle and Son, Limited, London, and consists of one of their 30in. air-pumps as an extractor, and No. 8 rectangular tube inlets with regulating valves. The wrought-iron gates and fencing have been supplied by Messrs. Hart, Son, and Co., of Birmingham. The heating apparatus is a low-pressure system, by Mr. William Mowbray, Lincoln. The buildings have generally been designed in harmony with the Elizabethan period. Messrs. Wright and Son, of Lincoln, were the contractors, and the plans were prepared by Mr. James Thropp, the surveyor of the Lindsey County Council, and Mr. R. D. Lockwood, of Scunthorpe, has been clerk of the works. The amount voted for the land and building was £6,100.

Shoreditch.—An underground sanitary convenience and lavatory, Shoreditch High-street, between Commercial-road and Great Eastern-street, was opened on Monday. It has been constructed at a total net cost of about £1,300, under the supervision of Mr. Ridyard Roscoe, surveyor to the vestry. The convenience is 60ft. by 15ft., and its floor is about 10ft. below the surface of the carriageway. The men's department contains twelve urinals, six w.c.'s, and three lavatories; the women's department at the southern end of the refuge includes three w.c.'s and one lavatory. The staircases are 4ft. wide, and the steps are faced with Mason's safety treads. The roof is constructed of rolled girders fixed upon granite stone frames. The contractors have been represented by Mr. G. B. Davis, their manager, Mr. Foreman Brown; and the plumbing work has been put in for Messrs. Jennings by Mr. Arthur Walter.

Southport.—The lady of the manor of Southport, Mrs. Hesketh, laid on Saturday the foundation-stone of Emmanuel Church, Cambridge-road, Southport. Only the contract for the central portion of the building has been let at present, and this alone will cost £11,900. Besides the site, Mrs. Hesketh has given £2,000, and other donations raise the amount promised to £9,260. Messrs. Preston and Vaughan, of Manchester, are the architects. The plan consists of a nave and aisles of five bays each of 19ft., with double transepts on each side. The clerestory, with its two long ranges of windows, will be open from end to end. The tower will consist of a ringing chamber and belfry, and will be 100ft. in height to the top of the parapet. The accommodation will be for 1,116 persons. At the ceremony the Bishop of Liverpool, Dr. Ryle, remarked that during the fifteen years he had been in Liverpool he had consecrated thirty-six churches. He should rejoice to see a grand cathedral in Liverpool, but he could not tell whether that desire would be realised. Perhaps the South African gold discoveries might cause someone to come forward with a million to buy a site in the heart of Liverpool to endow a dean and chapter.

Wakefield.—The old Grammar School building at Wakefield, which for nearly forty years past has been simply a store-house, is again to be used for educational purposes, and, with additions, was dedicated on Tuesday by the Bishop of the diocese. The building was erected in 1591 by Geo. Savile and his two sons, and from that time up to nearly forty years ago was the home of the Wakefield Grammar School. The old schoolroom, 76ft. by 22½ft., with open-timbered roof in oak, has been restored both inside and out. The additions that have been made comprise a large assembly hall, 60ft. by 30ft., opening out to the old school buildings; two new classrooms, 25ft. by 20ft.; and a teachers' room. There is also in this part of the building a senior boys' entrance, with a corridor. At the south end is another classroom, 24ft. by 20ft., with an entrance for juniors. There is accommodation altogether for 308 boys, exclusive of the assembly-room. The hall is well lighted with mullioned windows, and is heated with hot-water pipes, and there is also an open fireplace. In the basement is a gymnasium. Mr. F. Simpson is the architect.

West Hartlepool.—The Public Library was formally opened on Wednesday. It occupies of the site of 725 square yards at the rear of the municipal buildings, and forms the completion of the block, with which it is in harmony. The library consists of a one-story newsroom, 54ft. by 30ft., and 19ft. high. A panelled pitch-pine dado runs round the walls, which are also broken up by pilasters. The windows contain lead glazing above the transoms in all the rooms. The librarian's private office is centrally situated, and commands a full view of all departments. The lending library is 47ft. by 25ft., and 13ft. high. On the first floor, immediately above the lending-room, is the reference-room, 47ft. by 25ft., and 16ft. in height. The street façades are of Grosmont bricks, with terracotta dressings. The lighting is by incandescent lights. The estimated cost of the building is £3,000, and the fittings cost £500 more. The borough engineer (Mr. J. W. Brown) is the architect, and Mr. J. Davison, of Stockton, the contractor.

Wolstanton.—On Thursday, the 17th inst., the new chapel erected by the Wesleyan denomination of Wolstanton was opened. The design of the chapel is Gothic, of the Late Perpendicular period. Red bricks are used in the facing of the elevations, and the tracery and dressings are in Hollington stone. The plan of the church is cruciform, having a nave 86ft. long and 30ft. wide, terminating in an octagonal apse, and intersected with broad transepts, 30ft. wide and 25ft. deep, also two side aisles 16ft. deep. The chapel is seated for 684. The work, the cost of which will be about £4,000, has been carried out under the direction of the architect, Mr. A. R. Wood (Wood and Hutchings), of Tunstall-road, Burslem, Mr. G. A. Foster, of Longpost, being the contractor.

◆

A statue of the late Sir John Macdonald was unveiled on Wednesday, at Kingston, Ontario, the city which he represented for many years in the Dominion Parliament.

The late Mr. G. C. Benn, by his will, has bequeathed the extensive property in High-street, Rugby, known as the Shoulder of Mutton Inn, to the town, and has left with it a sum of £6,000. Of this sum £4,000 is to be spent on erecting buildings for the benefit of the town on the site of the Shoulder of Mutton, and the interest on the remaining £2,000—which is to be invested in Consols—is to be devoted to the maintenance and repair of the building.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the Building News, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to The Strand Newspaper Company, Limited.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

Situations.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is One Shilling for Twenty-four Words, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

Received.—Jas. Somers.—L. J. W.—Sculptor.—C. W.—A. T. and Co.—E. S. (Belfast).—W. F. L. Co.

Correspondence.

THE BELFAST CATHEDRAL COMPETITION.

To the Editor of the Building News.

Sir,—In your article last week on this forthcoming competition you refer to the possible chances of a Mr. "Tite Barnacle" winning it.

It is to be hoped that the assessor will insist on a "fair field and no favour" to all comers; but it is as well to remember that though the committee say they have decided to instruct the assessor to nominate six architects, it is an open secret, on the authority of the vicar, who is the prime mover in the whole affair, that two local architects and one Dublin one are to be amongst those selected. One of these architects at a preliminary meeting sent in sketch plans for the whole work and a report on same. Are any of these the "Tite Barnacle" referred to? Is the following resolution passed by the committee the back door for Mr. Tite Barnacle to come in by? "The design awarded first place by the assessor shall be the design adopted, unless it shall be found that a majority of not less than three-fourths of the committee are in favour of any other of the competing designs, in which case the latter shall be adopted."—I am, &c., Ulster.

◆

The governors of the University College of Wales met at the college at Aberystwith on Wednesday, when the treasurers reported that the appeal for £5,000 to meet the offer of a grant by Sir William Harcourt to complete the college buildings has been successful. Before the close of 1894 the whole of the £5,000 required had been promised, and the total subscriptions amount now to £5,803. The council reported that plans are being prepared by Mr. C. J. Ferguson, architect, of Carlisle and London, for the construction and completion of the whole of the college buildings.

Intercommunication.

QUESTIONS.

[11440.]—**Lead Lettering.**—When did the use of lead, now so usual for inscriptions in the better class of cemetery memorials, first come into use? I know of none more than 20 years old?—Bristol.

[11441.]—**Fungus.**—We are having a great deal of trouble with our house here for the following reason:—A sort of fungus has begun to grow around the ends of the joists in the stone basement walls, and along the exposed parts in the cellar. The ends of the joists, around which it has grown, have gone quite rotten. It (the fungus) has even penetrated through the floor, and was first found growing up one of the doorposts on the floor above. I should like your opinion as to the cause, and also as to the cure thereof. I should also inform you that the joist-ends are built into the wall with no cavity around. We have also had part of the stone wall pulled down, and find it literally stocked with a sort of root, not unlike a cobweb but stiffer and stronger.—Zero.

CHIPS.

On November 9th the provisional order recently obtained for the extension of the municipal boundaries of the borough of Taunton will come into force. The extension is almost entirely confined to the northern part of the borough, whilst upon the south there is but little deviation from the old boundary. The parishes affected are Staplegrove, St. James's Without, and St. Mary's Without. The present increase of inhabitants is but small, being approximately 1,116, and raising the estimated population from 18,026 to 19,142.

Mr. John Henry Cole, the well-known painter of Welsh landscapes, died on Sunday last in his 68th year, at the Royal Infirmary, Manchester. He was a prominent member of the Royal Cambrian Academy of Art, and his works had figured in the Royal Academy, the autumn exhibitions at Conway, Liverpool, and Manchester for many years.

The base of the cross to be erected in East Brent churchyard, as a memorial of the jubilee of Archdecon Denison, was completed last week. The sculptor is Mr. Harry Hems, of Exeter.

A reredos has been placed in the parish church, St. Just-in-Penwith, in memory of the late Mr. William Holman, the head of the firm of N. Holman and Sons, ironfounders, who was for many years vicar's warden.

A master builder, named Joseph McDermott, was fixing on Thursday in last week a small bolt beneath the tenor bell just placed in the tower of Londonderry Cathedral. While so engaged, the bell, which weighs 17cwt., was being held by means of a rope by some workmen below. Upon seeing the rope shake they let go, and the bell, which had been held mouth upwards, swung and caught McDermott, smashing his chest. Death was instantaneous.

Some workmen, who were employed in cutting a road through Watergate Hanger, a wood on the Planstead Estate, near Portsmouth, discovered, 2ft. below the surface, a tesselated pavement, apparently of Roman workmanship. It is laid in red and white tesseræ, 2in. square, in a good state of preservation; but only a small portion, about 6ft. by 4ft., has been uncovered, though it is considered probable that it forms part of the ground floor of a Roman villa.

The evidence and documents relative to the coroner's inquiry into the recent Morecambe Pier disaster having been forwarded to the Public Prosecutor, a communication has been received from the assistant-solicitor to the Treasury, stating that, after careful consideration of the whole of the evidence, he is of opinion that it is not such as to justify criminal proceedings being taken against any person or persons in respect of the deaths which occurred through the collapse of the eastern landing-stage of the pier.

A memorial bust of the late Duke of Devonshire was unveiled on Wednesday at Buxton. The bust, of white Sicilian marble, is the work of Mr. Keyworth, of London. It is fixed in the new pump-room, the last gift of the late Duke.

Mr. Hanbury, M.P., accompanied by Mr. A. T. Pentland, Board of Works engineer, visited Queenstown on Wednesday to inspect the site of the proposed new Custom-house, and also the existing building used for that purpose.

The Methodist Free Church, Hyson Green, Nottingham, are building a new church and schools on the Gregory Boulevard, from the plans of Mr. F. W. Dixon, at a cost of £3,500. Memorial stones were laid on Monday.

The Science and Art Department have issued to science and art schools a circular inclosing a minute of the Education Department, sanctioned by the Treasury as an experiment, making the grants for instruction in science and art depend partly on attendance and partly on payment by results as tested by examinations.

Legal.

DRAIN-REPAIRING.

HOUSE-DRAINS are a constant source of trouble and litigation between owners and occupiers, and in one way or another they are a very fruitful cause of annoyance. The law is not in a satisfactory state as to the ultimate liability of the beneficiary owner for their making or their repair; and, indeed, the whole question is so complex and confused that it would seem as if it could only be settled by means of a new Act of Parliament dealing with the whole subject. But however that may be, and whenever it may come to pass, it is well to use the law as it stands to the best advantage, and therefore it is satisfactory to note a case which we reported last week from the Woolwich Police-court, and which certainly should be a useful caution to all whom it may concern. The facts were simple and usual enough. The sanitary inspector of the Plumstead Vestry had complained to the agent of some property in his district about a defective drain. The agent promised to attend to it, and employed a local workman for that purpose. After the job was finished, the inspector went again, and found that a loose pipe had been put over a broken joint, so that both sewage and sewer-gas could escape, and that earth had got into the drain.

Thereupon both the agent and the workman were summoned to the police-court for repairing the drain in such a way as to be a nuisance. Evidence was given of the above facts, and the agent proved having employed the workman, who, by the way, had since done the repairs properly. The magistrate discharged the agent, who had taken no part in the repairs, having handed the job over to a competent workman, and so was not legally liable. But as to this workman, the magistrate fined him £5 and the costs, saying it was one of the worst cases he had ever heard of, and that if he had not been a poor man the fine would have been £10. This result is very satisfactory, in so far as it shows that even under the present law the actual person responsible for bad work, which may cause indefinite suffering in the way of disease and death to wholly innocent people, can be so readily reached and so promptly punished; and it is to be hoped that, if necessary, the lesson will be frequently repeated.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

W. J. M.—Houses.—Drains.—Sewer.—I do not think you can compel the corporation to bring a sewer up to your drain. You must rather go to their sewer, and arrange with owners of ground unless, indeed, the local authorities were to take over the new road.

D. G.—Road.—Building Line.—Plans.—The local authority are justified in their proposed building line, and after service of their notice you would not be safe in building beyond that line.

W. K.—Building.—Plans.—Time.—There is no such special limit; but circumstances may alter the state of things, or the land or local regulations may be changed meanwhile.

Injured.—Tender.—Estimates.—I do not think there is any right of action in such a case, as there is not any obligation to accept the lowest tender.

The seventh great International Art Exhibition will be held at Munich in 1897, mainly on the lines of the rules of the Exhibition of 1892.

The city council of Manchester have decided to extend the Municipal Art School in Cavendish-street in that city at a cost of £6,000, and have also voted £400 a year towards the maintenance of the museum at Owens College.

The promoters of the Newcastle, Manchester, and Glasgow railway scheme will again seek Parliamentary powers for the construction of the line this session. A feature of the proposal is a new bridge across the Tyne from High-street, Gateshead, to Pilgrim-street, Newcastle, which will, like the present well-known High-Level Bridge, be a combined railway and road bridge.

The Wesleyan day schools at Penzance were reopened, after enlargement and remodelling, on Monday last. The schools were built in 1867 from designs by Mr. W. H. Trounson, M.S.A., of Clarence-street, Penzance, who has been the architect for the present work, which has increased the accommodation to 400 school places. Mr. W. H. Trounson was the contractor for the whole work, and the masons' work was sublet to Messrs. A. and W. Trythall. The cost has been about £900.

LEGAL INTELLIGENCE.

Arbitration in Leeds.—At the Great Northern Station Hotel, Leeds, on Monday, Mr. Milnes, of Bradford, sat as arbitrator in reference to a claim of the trustees of the late Mr. William Dawson for the value of certain property, which, under a notice to treat, given by the Leeds Junction Railway Company, came up for valuation. The property in question is situate at Rothwell, and comprises about 4½ acres. The witnesses called for the owners were Mr. Farrer, Mr. Horsfall, Mr. Hepper, and Mr. Hollis; while Mr. Bairstow called Mr. Fenwick and Mr. Joseph Smith (Bradford). The proceedings lasted the whole day.

Architects' Fees.—At the Preston County-court, on Tuesday, Mr. J. Fish, architect, of Preston and Manchester, sued Mr. T. Parkinson, biscuit manufacturer, of Preston, to recover £22 for services rendered. In 1894 the defendant instructed Mr. Fish to prepare plans for a house to be erected at Moor Park, Preston. When the plans were submitted to the defendant, he suggested the addition of a coach-house with stables, and the plaintiff said that would alter the agreement, as the cost of the plans (£15) had been agreed upon. The defendant said he was "not particular to a few pounds," and the plans were therefore modified, and afterwards passed by the corporation committee. The defendant said the stables were mentioned from the first, and it was an oversight on his part that they were not mentioned in the agreement. His Honour found that the plaintiff had carried out the work mentioned in the agreement, and gave a verdict for £22 and costs.

The M S. and L. Extension to London.—The Eyre Estate Arbitration.—The hearing of this important case between the trustees of the Eyre estate and the Manchester, Sheffield, and Lincolnshire Railway Company, to determine the sum to be paid by the railway company for the acquisition of 46 acres of land—a portion of the Eyre estate—for their terminal station in St. John's Wood and Marylebone, has been continued during the past week. The amount in dispute exceeds half a million sterling, and the sum offered by the respondents as compensation falls short of the claim by some £150,000. Mr. E. H. Bousfield, a member of the firm of Messrs. Edwin Fox and Bousfield, called on behalf of the trustees, said that the Eyre estate combined in a unique degree the attractions both of a Metropolitan and suburban neighbourhood. In ascertaining the present value of the unexpired ground-rents they ought to be capitalised at 2½ per cent. In determining the reversionary value of the property, one part had been treated as house property and the other as land, for, at the expiration of the present leases a part of the ground would be cleared. The reversionary value of the house property should be estimated at 20 years' purchase of the rental value. The value of the land property would be 3d. a foot, which, capitalised at 20 years' purchase, would give £10,800 per acre. The land would be worth that whether it was used for the erection of houses, flats, or shops. He estimated the price which the company should pay as follows:—For the existing ground-rents, £55,574; for the reversion of house property, £121,929; of land, £228,243. On the question of consequential damage, he was of opinion that the adjoining property would be depreciated to the extent of one-fifth of the annual value, which sum when capitalised amounted to £38,720. Cross-examined: The witness thought the effect of the railway would be felt by the trustees after 33 years. It was a fact that, on the principle of calculation adopted by him, the trustees would get £6,334 for premises of which the ground-rent was £14, with 21 years to run, and £63,779 for premises held at a ground-rent of £324, with 42 years unexpired. At the end of 42 years the freeholders would, in the latter case, come into a rental of £7,000 a year. The witness had had applications from intending purchasers of ground-rents at 2 per cent. Re-examined: When rents had once been reduced they could not be put up at the expiration of the lease. Mr. F. T. Galsworthy, of Messrs. Chinnock, Galsworthy, and Chinnock, gave similar evidence as to the proper method of arriving at the sum to be paid. He thought there would be great depreciation in the value of the property. Mr. James Chisholm, actuary of the Imperial Life Assurance Company, said that in estimating the present value of a certain sum due at a future date it was not right to take a higher rate of interest than 2½ per cent. Some discussion took place between counsel as to the annual rental value of the property, comprising 158 houses, taken by the company, and it was agreed that £14,500 was the amount. This closed the case for the trustees. Mr. Alexander Rose Stenning, architect and surveyor, Cannon-street, said that he had been engaged since 1888 by the company to survey the property required, and to estimate its probable cost. He did not think the railway would cause any permanent depreciation to the neighbourhood. Except for one part, 125 yards in length, the railway in this district would be entirely inclosed at an average depth of 33ft. The construction of the Metropolitan Railway had not caused any fall in rents in the neighbourhood. Such fall as there had been was due to the fact of people preferring more modern dwellings. The houses on this estate were lacking in modern sanitary appliances; out of 150 only 12 had fixed baths. The houses were also far from substantial, and would not last much longer than the leases. A 10 per cent. deduction must be made from the annual value for repairs by the landlord, and other outgoings, before the net rental could be ascertained. Sir E. Clarke here interposed, and said that on the previous day the net rental had been agreed at £14,500. Sir J. Whittaker Ellis, recalled, said that he put the net annual value at £15,037, from which no deduction should be made. The 10 per cent. deduction mentioned by Mr. Stenning did not apply to houses on lease. Mr. Stenning continued that these freeholds would fetch from 16 to 18 years' purchase in the market, certainly not 20 years'. The sum should be capitalised on the 4 per cent. table. The reversions being perishable bricks and mortar, should be capitalised on the 5 per cent. table. As to the suggested value of a portion of the estate for rebuilding, the witness thought the plans prepared could not be carried out, as the class of house which had been suggested would not be of a character suitable to the neighbourhood. The witness assessed the total amount payable by the company at £200,503. Cross-examined, the witness said that he remembered the company first offering for ten acres of land £417,000. They afterwards wanted sixty-six acres for one and a quarter millions sterling. The witness was questioned at some length with regard to the evidence given by him on behalf of the company before Parliamentary committees in 1891 and 1892, with the view of showing that his estimate of the cost of the property was then considerably in excess of his present estimate. The difference in the estimates of the parties was mainly due to the uncertainty as to the future value of the estate. Mr. Robert Vigers, of 4, Frederick's-place, Old Jewry, vice-president of the Surveyors' Institution, said that with reference to calculations for the sale and purchase of land and houses for a railway company, it was the general custom to take the ground-rents upon the 25 years' purchase table for the length of term then unexpired. With regard to the reversion, it was usual to take as nearly as possible the present rent being paid by the tenants occupying the houses, to deduct from 10 to 20 per cent. for outgoings, and then to capitalise the net rent upon a 5 per cent., or 20 years' purchase, table. That would be a very liberal price, because there was only a limited market for ground-rent reversions. He thought that if the trustees were paid £199,669 they would be amply compensated. Cross-examined: The trustees would be able to get 4 per cent. amply secured on mortgages. In arriving at the present value of the reversion the 5 per cent. table should be used, because the security was not absolute. If it was desired to make an absolute certainty of the future sum, it would be right to estimate on the 2½ per cent. table; but this would give the trustees a better security than they previously had. Mr. Daniel Watney, the president of the Surveyors' Institution, confirmed the methods of calculation and figures of Mr. Vigers; £14,369 was a sufficient sum to take as the rental value. Plenty of this class of property in any part of London could be bought in the public market at 16 years' purchase. He considered the sum of £200,932 as fair compensation, including compulsory sale, for the whole of the property acquired by the company.—On Wednesday, Mr. Samuel Higgins, a surveyor and valuer carrying on business in Finchley-road, gave evidence as to the value of property in the district. Mr. Daniel Watney, cross-examined, said that for the last 40 years it had been the rule in compensation cases to take 20 years' purchase of freeholds. He recognised that there had been a change in the rate of interest; but as he took property, and not money, as the basis of his calculations, that change did not affect the question. Sir Douglas Fox said that he was the engineer engaged on the Metropolitan division of the new line. He produced plans showing the depth of the railway at various points, and explained the manner in which the line would be constructed. He did not think that vibration from the railway would be felt in adjoining houses to any appreciable extent. This concluded the evidence on behalf of the railway company, and Mr. Littler then addressed the arbitrator on behalf of the company. He said the statement that had been made that the company had offered £300,000 was entirely without foundation. No offer had been made. The questions to be decided depended solely on the evidence which had been given, and the company left those questions with confidence to the arbitrator. When the case was opened, no mention was made of the fact that the estate was cut through by the Metropolitan and North-Western Railways, and had in immediate proximity the Midland and North London Railways. St. John's Wood was not a pastoral district. It was a mere ordinary London suburb, laid out some time ago, and land being cheaper then than now, the houses had more land attached to them than was usual; but there was the countervailing disadvantage that the houses were old-fashioned and without modern conveniences.

In re Morgan, Isted, and Morgan.—At the Southampton County-court, on Tuesday week, an application was made to Judge Leonard for the discharge of Messrs. Morgan, Isted, and Morgan, builders, formerly of Southampton. It was an adjourned application, opposed on behalf of one of the creditors, Messrs. Bradbury and Co. The bankrupts' solicitor said the adjournment took place because of difficulties in connection with the trustee, who had since the adjournment been removed by the Board of Trade. His clients alleged that the mismanagement of the estate led to such a small dividend being paid. The debtors were adjudicated bankrupt in September, 1893. The gross liabilities were £5,063, and the assets £1,316. A first dividend of 1s. 6d. in the pound was paid, and it was proposed to pay a further dividend of 9d. in the pound. In his file the Official Receiver commented on the youth and inexperience and hazardous speculation of the bankrupts, and complained that proper books had not been kept. The cause of debtors' failure was the acceptance of a contract at Swindon. With regard to the allegation of fraudulent preference between Isted and his father, the solicitor said that it was an ordinary transaction. The father advanced his son £260 in all, and actually lost £120 in hard cash. His Honour said it was plain there had been hazardous speculation, and he should suspend the discharge for three years.

In re J. Fretwell.—John Fretwell, builder and general contractor, against whom a receiving order was made on the 27th ult., has submitted accounts showing his liabilities to be £1,648, of which £637 are unsecured, with assets £213. He commenced business in 1881, without capital, at Wood-green, removing subsequently to 2, New-road, Crouch End, and eventually to 61, The Broadway, Crouch End, where he has traded for about the last ten years down to the date of the receiving order. In November last he made a private arrangement with his creditors, under which he agreed to pay a composition of 10s. in the £ by four equal quarterly instalments. The debtor attributes his present failure to the payment of the instalments and expenses of the composition. He makes no proposal, and has been adjudged bankrupt.

The ratepayers of Shrewsbury lately rejected an extensive scheme for a new water-supply from the upper reaches of the Severn, proposed by the Town Council. At their last meeting the latter body adopted a smaller proposal submitted by the borough surveyor, Mr. W. Chapple Eddowes, for augmenting the supply from the Weir Coppice source, and providing large conduits at an estimated cost of £1,800 only.

The board of consulting engineers on the Lake Erie and Ohio ship-canal project has begun its survey of the ground. The board is composed of Gen. H. L. Abbott, Prof. L. M. Haupt, and Major N. H. Hutton. Assembling at Pittsburg, the Davis Island dam and the work in progress at Herr's Island, in the Alleghany River, have been examined and a general view of the manufacturing industries along the river fronts obtained. The board is being escorted over the line of the proposed canal by the chief engineer, Mr. George M. Lehman.

The scheme for rebuilding Holy Trinity Church, Hoghton-street and Manchester-road, Southport, which has been afoot seven years, took a definite shape on Monday, when it was unanimously decided to adopt plans by the late Mr. John Sutton, to cost £22,000 in the carrying out. A nucleus fund of £1,200 was increased by the meeting to £1,600, and the scheme, which contemplates accommodation for 1,500 persons, will be at once undertaken in sections, so as not to interfere with the services, the old site being utilised. In the proposed church the chancel will face the south, and hence the lighting must be from large side windows. The old church of brick and stucco dates from 1837, and is quite unworthy of the site.

At the Estate Sale Rooms, Birmingham, the Brockenhurst Hall Estate, Chaddesley Corbett, was offered for sale on Monday. The hall was erected sixteen years ago from the designs of Mr. J. Bland. It is built of red brick, with terracotta reliefs and half-timbered gables, and a tower rising to a height of 80ft. The property comprises pleasure grounds and a finely-timbered park, with a total area of 45 acres 3 roods 33 perches. It cost the former owner upwards of £28,000, but the bidding only reached £5,800, at which price the property was withdrawn.

In St. Anselm's Chapel of Canterbury Cathedral, the Dean of Canterbury, Dr. Farrar, unveiled on Monday a new reredos just placed there in memory of the late Canon and Mrs. Cadman. The reredos is in mosaics, in a frame of Purbeck marble *opus sectile*, by Messrs. Powell, of Whitefriars. The subject is our Lord in glory, with SS. Peter and Paul on either side.

WATER SUPPLY AND SANITARY MATTERS.

Coventry.—The new waterworks for Coventry, constructed for the corporation, were formally opened the other day. The engineer is Mr. Charles Hawkesley, the son of the late Mr. Thomas Hawkesley, from whose design the works in Spon-lane were constructed in 1847 at a cost of £23,000, and who, from that time until his death two years ago, was consulting engineer to the corporation. An Act of Parliament was obtained in 1889 empowering the corporation to sink wells and erect pumping-stations at Whitley and Radford, to construct two reservoirs at Barker's Butts, and to lay mains connecting the Whitley works with the Barker's Butts reservoirs, and the proposed Radford works with the tank at Spon End. Trial bore-holes at Radford did not yield a satisfactory supply, and that part of the scheme was not undertaken. The construction of the new reservoirs was proceeded with immediately, the contract being intrusted to Messrs. G. F. Smith and Sons, of Milverton; and in 1890 Mr. Hawksley prepared plans and specifications for a well, engines, and works at Whitley, with mains to Barker's Butts reservoirs. In 1891-2 the laying of mains from Whitley to the new reservoirs at Barker's Butts was carried out, the contractor being Mr. J. T. Wingrove, of Northampton. Contracts were also entered into with Messrs. Thomas Tilley and Son, of London, for sinking the well; with Mr. C. G. Hill, of Coventry, for building the pumping-station; and with Messrs. Richard Moreland and Son, of London, for the construction of the pumping machinery. The well at Whitley, over which the pumping station is constructed, is elliptical in form, 14ft. by 9ft. to a depth of 150ft. Below this a 24in. bore is carried to a further depth of 250ft. The yield of water is about one million gallons per day. The pumping-station comprises engine and boiler houses, coal shed, smith's shop, and stores. The total cost of the works, including the new reservoirs, has been about £65,000.

Denbigh.—The town council have received the special report from Mr. Isaac Shone, the engineer appointed to report upon the present defective state of the drainage, and to suggest a remedy. He points out that from the catchpit on Ruthin-road to the sewage farm at Eglwswen the sewer has been improperly laid, so much so that the malconstruction has reduced the discharging capacity of the drain from 1,633 gallons per minute to 299 gallons per minute. With such a badly-constructed drain, and with the suicidal policy of emptying the sewage and rainfall water into the same sewer, it is not surprising to find the overflows complained of. He does not consider the Shone system of pumping required, as there are good gradients to be obtained throughout; and the least expensive system of remedy, to avoid doing away with the present sewer, to which all the connections with the house drains are made, is to construct from the Ruthin-road catchpit to the outfall a new 24in. outfall sewer in a straight line to the farm, so that when rain falls and the present catchpit overflow begins, the new sewer would receive the overflow sewage and water, and convey it to the farm outlet.

Kettering.—A special meeting of the Kettering urban council was held last week to consider the whole question of the pollution of the river Ise. Mr. Thomas Reader Smith, the surveyor, explained that in his plans for the dual system he suggested that twelve districts be formed for new sewers, as well as surface-water drains. The total estimated cost for the dual system of drainage was £10,000, or, with two underground urinals, the estimated cost was £12,100. The consideration of the scheme was adjourned.

Rhyl Water Supply.—A special meeting of the Rhyl Urban District Council was held on Friday to consider the special report of Mr. Storr, C.E., with reference to the water supply. Mr. Storr recommended the laying of a new 8in. main from Bodelwyddan Hill to Pen-y-Cefndy, and a 12in. or a 14in. main from Pen-y-Cefndy to the centre of Rhyl; also the construction of an elevated tank at Pen-y-Cefndy at such a height as to give a uniform pressure of 80ft. at Rhyl at all times. The cost of the new 8in. main was estimated at £3,811 18s. 9d., of the 14in. main £1,942 1s. 8d., and of the elevated tank £2,500 (approximate); total £8,254. Mr. Stow was present, and the various matters in his report were dealt with seriatim. It was agreed to give instructions for the preparation of plans and estimates, with the view of making application to the Local Government Board for a loan.

In the catacombs of Santa Priscilla, two miles beyond the Porta Salaria of Rome, Professor Wilpert has discovered in the Greek Chapel a painting of the 2nd century representing the Eucharist. It represents the faithful assembled round the altar, while the officiating priest breaks the consecrated bread and distributes it for the Holy Communion. Standing out clearly in the details of the painting are the cup and the fish.

STATUES, MEMORIALS, &c.

Fochabers, N.B.—The memorial erected to commemorate Major Alan Wilson's gallantry near the Shangani River in South Africa in 1893 was inaugurated on Friday by the Earl of March. The memorial stands at the side of the public highway opposite the main entrance to Gordon Castle, Fochabers, and has been built partly of Peterhead and partly of Aberdeen granite. It stands about 17ft. high. A couple of steps all round lead up to the main column, the moulded base being of axed granite. Above this stand six pillars of polished Peterhead granite, with bases and caps of Aberdeen granite, inclosing a drinking fountain, and surmounted by a canopy of Aberdeen granite. The design was prepared by Mr. Cutler, and has been carried out by Messrs. Whitehead, of Aberdeen.

CHIPS.

It has been decided to erect a borough lunatic asylum for Cardiff.

A special meeting of the urban council of Trowbridge was held on Monday to consider the question of sewage disposal. In reply to inquiries made by a committee, Mr. Baldwin Latham, of London, wrote that he would visit the district and report on the matter for a fee of fifty guineas, and Mr. W. H. Radford, of Nottingham, wrote in similar terms, stating that his fee would be £50. It was decided to engage Mr. Radford.

A new police station is about to be built at Stoke-on-Trent, and the plans of Messrs. Wood and Hutchings, of Burslem and Tunstall, have been selected in a limited competition by the Staffordshire Standing Joint Committee. The work will be proceeded with at once.

Proof was led on Monday in the Clarendon Hotel, Edinburgh, in a reference between the London and Berlin Mantle Manufacturing Company, No. 63, North Bridge, Edinburgh, and the North British Railway Company. The oversman was Sheriff Jameson, and the arbiter for claimants was Mr. T. M. Mackay, S.S.C., the arbiter for respondents being Mr. W. Hamilton Beattie, architect, of Edinburgh.

The Thomas Chirgwin memorial stained-glass window to be placed in Truro Cathedral will be one of the comprehensive historical series. It will depict the Venerable Bede dying dictating the translation of St. John's Gospel.

The property known as the County School, Dorchester, was submitted to the hammer last week, when Mr. T. C. Saunders, of Charminster, and late of Watercombe, became the purchaser at £4,800.

Bothwell School Board accepted on Monday tenders for the erection of a new school at Bellshill. The school is to accommodate 1,049 scholars, and the cost comes to £10,685 19s. 2d. This, with items not yet estimated for, will make a total outlay of £12,385 19s. 2d.

The various estates belonging to the Balfour group are being developed on a plan which Mr. Balfour alleges he himself suggested soon after the failure of the company. In connection with one of these estates, the arrangements could not be carried out without a meeting of the directors, which, by permission of the authorities, was held in Holloway Gaol on Tuesday.

The new isolation hospital, Watford, is nearing completion, and has been erected from the designs and under the superintendence of Mr. C. P. Ayres, architect, of Watford, the builders being Messrs. Andrews and Sons, of Watford. The wards are warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, Shorland's patent exhaust roof ventilators and inlet ventilating panels, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

St Matthew's Church, Summerhill-place, Newcastle-on-Tyne, has been completed by the building of the tower under the superintendence of Messrs. Hicks and Charlewood, of Newcastle, and the placing therein of a peal of eight bells, cast by Messrs. Taylor and Co., of Loughborough. The tenor bell weighs 31¼cwt. The dedication ceremony was performed by the Bishop of Newcastle on Tuesday.

On Thursday week the Sleaford Gas Company inaugurated their new gasworks. Gas managers from all parts of England were present on the invitation of Mr. Wimhurst, the Sleaford manager. The works have been carried out by Messrs. R. and J. Dempster, of Manchester, at a cost of £7,000.

The old Market Cross of Peebles, which dates from before 1320, and which has been many times shifted during the present century, has now been restored to its original site at the junction of High-street, Northgate, and Eastgate at the expense of Major Thornburn. The shaft of the cross stood for many years in the quadrangle of Chambers' Institution.

Our Office Table.

The London County Council resumed on Tuesday the debate on the recommendation of the Parliamentary Committee that the Council invite the Government either to deal with the question of the London water supply themselves or to appoint a Royal Commission to do so. Last week an amendment moved by Mr. Stuart, M.P., in favour of proceeding with the Council's Water Bills was defeated by a majority of one. Dr. Collins now moved an amendment referring it to the Parliamentary Committee to report without delay the lines on which they suggest that the Government should be asked to legislate. After a long debate, the amendment was carried on a division by 65 to 56 votes. It was agreed to expend £6,770 on the erection of a Weights and Measures Office in Harrow-road, and £5,890 in building a central laundry in the Boundary-street area, Bethnal Green, the works to be carried on in each case without the intervention of a contractor.

The first of the annual course of free lectures on "Building and Sanitary Construction," given at 8 p.m., under the auspices of the Carpenters' Company, at their hall, will be delivered on Wednesday evening next by Professor T. Roger Smith, F.R.I.B.A., who will take as his subject "Timber, Site and Foundations." The well-known names of the lecturers and the subjects chosen make it safe to predict that the candidates for the Company's examination for their sanitary certificate, and others interested in sanitation, attending these lectures, will be well repaid for their trouble in going to Carpenters' Hall, London Wall, on the next five Wednesday evenings.

In connection with the discussion as to the future supply of London with water, a suggestion has been made that it may be found advisable to consider whether the Lake District might not be put under contribution to supplement the supplies from the Thames valley area. The city of Manchester has already appropriated Thirlemere, and it is suggested that the Metropolis should in like manner utilise Hawes Water as a reservoir. Hawes Water is the highest of the lakes in the district, lying 694ft. above sea-level. Its area is about half a square mile; and its greatest depth, according to Dr. Hugh Robert Mills's recent bathymetrical survey, was 103ft., near the middle of the southern section. The district has one of the heaviest rainfalls in England, and it may be reckoned at something over 90in., so that an abundant supply might be counted on. The total contents of the lake are estimated at six hundred millions of cubic feet, or something over three thousand six hundred millions of gallons, and the configuration of the lake would render it a task of no great engineering difficulty to raise its level to as much as 800ft. above sea level. To effect this a dam but little more than half a mile across would be sufficient.

The directors of the London Tramways Company decided on Tuesday to take the bold step of undertaking the passenger traffic on the Thames, subject to the sanction of the shareholders, who will be asked on Tuesday, November 12, to agree to the change of the title to "the London Tramways and Steamboats Company, Limited." The directors of the company propose to develop the Thames river traffic upon most enterprising lines. The steamboats will be 32 in number, and designed to carry 500 passengers each. The boats will be built somewhat upon the plan of the present Nile steamers, with decks of two stories covered in for their entire length by permanent awnings. In the event of the shareholders assenting to the scheme, the whole fleet are promised to be ready by June next.

At the last meeting of the City Council of Sheffield the action of the Improvement Committee in the contracts for furnishing the new town hall, now in course of completion from Mr. E. W. Mountford's designs, was severely criticised. It was admitted that the Improvement Committee had received a second tender from a local firm, Messrs. Johnson and Appleyards, whose first essay fourteen days before had been rejected because the amount exceeded the lowest tender, that of Mr. T. D. Woof, by about a thousand pounds. At the second trial the newly-received tender was a few shillings the lowest in one department and ten pounds less in another. The committee, without asking the other contractors to send in supplementary tenders, gave the work for these departments to the new tenderer. Mr. Duncan Gilmour now put the pertinent question: "Do you approve of the action of the committee in accepting a tender which was made up and sent in fourteen days after all the other tenders had been opened and the figures known?" An acrimonious discussion ensued, during which the defenders of the committee contended that the contract could not be rescinded as the work was now in progress, enforcing a moral obligation on the committee to proceed. In the end, Mr. Gilmour withdrew his amendment, and the storm subsided.

Mr. E. P. Burd, an inspector of the Local Government Board, held an inquiry at the Town-hall, Liverpool, on the 17th inst., as to an application by the corporation for sanction of the disposal of a portion of land within Newsham Park by way of building leases for 999 years, subject to conditions, for the erection of a class of houses of a lower rental than that obtained for houses built on other land forming part of the same estate. Mr. Shelmerdine, the city surveyor, said he had prepared plans for laying out the estate, these including a boulevard and a narrower street for carriage traffic. Certainly he would not recommend to the corporation anything that would tend to the depreciation of the property of the present leaseholders in the park. Alderman Bowring, the chairman of the committee, explained that now the area of the city had been extended, the council were desirous to construct the proposed boulevard, and make the land available for dwellings. It had been repeatedly offered on the terms of 75 years' leases, and no buyers had been found. The committee believed that on the terms of the longer leases it would sell. There was no desire to injure existing leaseholders, and the Corporation would not allow the erection of buildings which were objectionable to the leaseholders and others. The scheme was warmly opposed by residents in the locality, whose representatives urged that the scheme would involve a large speculative expenditure. The reason the corporation had not hitherto got bidders for the land was that they had neglected the park. The land proposed to be built upon should be laid out as ornamental grounds for the use of the people. Mr. James Wainright, architect and surveyor, stated that the execution of the Corporation scheme would lead to the deterioration of the value of property in the neighbourhood. As to the class of houses proposed to be built, a large number in the district were already empty.

The County Council of Inverness-shire had under consideration on Friday the subject of the erection of aluminium works at Foyers, and the consequent destruction of the Falls. The clerk submitted a summary of some hundreds of petitions and letters which had been received protesting against the destruction of the Falls, but it was held that the matter had passed that stage, and as the road board had done all that was possible to protect the county's interests, nothing further could be done. Mr. Burns protested for himself against the destruction of the natural beauties of the picturesque region of Foyers. We are glad to hear that there is no likelihood that the same aluminium company will be successful in other negotiations to acquire the sole rights to the scarcely less beautiful and far more accessible Falls on the Clyde.

Mr. Bell, the county surveyor of Cumberland, has made a fresh survey of the western portion of the proposed coach road from Borrowdale to Wasdale, over the Styhead Pass, and has altered the line of route from that which was originally sketched. The new line of route, on leaving Wasdale Head Hotel, follows the right bank of Mosedale Beck to the head of Mosedale; it then turns and come down the valley on the left bank of the stream, and passes also along the face of the Great Gable to the summit of Styhead. The gradient for the first 750 yards of the ascent is 1 in 12, and for the remainder 1 in 20. The length of the road is four miles and 1,402 yards, as compared with two miles and 133 yards, the length of the present steep footpath from Wasdale Head Hotel to the top of Styhead. The distance is longer than the road first sketched, but the difficulties of construction will be less, and the county surveyor is still confident that the scheme could be carried out for £10,000. The interest in the proposal is growing, the number of tourists to the particular district being greatly on the increase, but it promises to be strenuously opposed in parts of the contributory area.

There was a large attendance at the opening meeting of the session of the Society of Literature, History, and the Fine Arts, held at the University College, Liverpool, on Friday evening, when an inaugural address was delivered by Professor F. M. Simpson, its subject being "Reticence in Art." Proclaiming himself an advocate of simplicity and modesty in all departments of art, in painting, architecture, and mural decoration, Professor Simpson condemned the modern tendency towards over-elaboration, and pointed out that picturesqueness was most often found in simplicity. Many of his comments were more from a practical than a theoretical point of view, and those devoted to the inner and outward embellishment of residential property were deserving of remembrance. Street architecture of the present day was the subject of adverse criticism at his hands.

We have received the annual reports of the Vestry of St. Luke for the year ending Lady Day, 1895. The abstracts of the accounts of the vestry rates, the contracts of the vestry, schedule of properties, and the reports of the vestry clerk and surveyor take up several pages. The surveyor, Mr. M. C. Meaby, Assoc.Inst.C.E., reports on paving, lighting, sewers, &c. Work has been carried out without the intervention of a contractor. Several improvements are noticed, such as the widening of Bell-alley, improving the levels of Mount Mill by lowering it, the City-road frontage line. The vestry, through their surveyor, rightly made a stand against any advance of the line of building. The report of Dr. Yarrow, medical officer, on the sanitary condition of the parish, shows that the year past had the smallest number of deaths for nine years, or a death-rate of 22·14 per 1,000. The accommodation of the various industrial dwellings in the parish is given; the rents vary from 2s. per week for single rooms to 9s. or 11s. for six rooms. The total number of families occupying artisans' dwellings, estimating 4½ persons to each family, gives a total of 7,884 persons. The largest block is the Peabody Buildings in Whitecross-street, of 33 blocks, which contains 843 lettings in single rooms, two, three, and four-roomed lettings.

On Thursday in last week the architectural pottery at Hamworthy, near Poole, which has during the past few years been lying idle, was put up to the hammer, and was knocked down to the enterprising firm of Carter and Co., who have for over 20 years carried on an important trade in encaustic tiles and pottery ware at their extensive works on the East Quay, and at West Quay-road, Poole. The Architectural Pottery was erected in the year 1854, by the late Mr. Sanders, for the manufacture of encaustic tiles, an industry which had only a few years previously been revived in this country, and this business is therefore one of the oldest in the trade. After Mr. Sanders's death the business was continued for some years by his two sons, and subsequently was disposed of to a company, whose existence was but of short duration, and the works have been practically closed for the past four or five years. Messrs. Carter's workmen were busy on the day following the auction repairing buildings and machinery in order that a start may be made as soon as possible, the Dorset Ironfoundry Co. having been also engaged in pulling down machinery and carrying out all the necessary engineering matters. Messrs. Carter are also rapidly developing their art pottery department, a branch which was added towards the end of last year, and which it is intended to remove from West Quay-road to Hamworthy.

At Mostyn House School, Parkgate, Cheshire, the foundation stone was laid last week of a new school chapel, which is being erected by the owner and head master. The builder is Mr. W. Fleming, of Neston.

Major-General H. D. Crozier, C.E., an inspector from the Local Government Board, held an inquiry at the Grenoside Workhouse, Sheffield, on Oct. 16th, respecting the borrowing of £3,000 for the purpose of carrying out the proposed sewage scheme for Grenoside and district. Mr. Dransfield, clerk, stated this sum was needed for the purpose of sewering Grenoside and surrounding area, including the workhouse, Middleton Green, The Wheel, Whitley, Grenoside village, and Nether Houses. The council proposed to unite these drains with the Ecclesfield outfall works, which had been completed about 18 months. Mr. G. E. Beaumont, the surveyor to the council, produced and explained the plans.

MEETINGS FOR THE ENSUING WEEK.

Tuesday. — Society of Architects. Annual General Meeting, St. James's Hall, Piccadilly. 8 p.m.

Wednesday.—Carpenters' Hall Technical Lectures. "Timber, Site and Foundation," by Professor T. Roger Smith. 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

The ANNIVERSARY MEETING of the Society of Architects for the Session 1894-95 will be held at the Rooms of the Society, at St. James' Hall, Piccadilly, W., on TUESDAY, October 29th, at Eight o'clock p.m., when the OFFICERS and COUNCIL for the Year 1895-96 will be duly ELECTED.

ELLIS MARSLAND, Hon. Sec.

CHIPS.

On Sunday, a section extending to about 150ft. by 21ft. of the north pier, Fraserburgh, fell into Balaclava Channel, carrying the body of the pier with it. It was only on Saturday that the coffer-dam was completed, and everything got ready for commencing the deepening improvements; and the accident will therefore greatly hinder that work. Pressure of water on the outside caused the accident.

Mr. W. B. Richmond, A.R.A., has been appointed professor of painting at the Royal Academy, vice the late John E. Hodgson, R.A.

The bronze statue of Edward Colston, which is to be erected in St. Augustine's open space, Bristol, has been successfully cast at the Coalbrookdale Works, and it is expected to be delivered in Bristol by Friday in next week, the 1st of November. Provided the pedestal can be got ready in time, the unveiling will take place on Colston Day.

As a memorial of the bicentenary of Henry Purcell it is proposed to provide a suitable case for the organ in Westminster Abbey, where Purcell was organist for 15 years, and within the walls of which he lies buried. Mr. John L. Pearson, R.A., has prepared a design, the cost of which is estimated at not less than £2,000, for the two divisions of the organ. Towards this amount the Dean and Chapter have promised £500.

The work of telephonically connecting the coast-guard station on the cliffs at Ramsgate with Ramsgate Harbour was completed by the Government authorities on Saturday. The object is to enable information of disasters on the Goodwins to be more speedily communicated to Ramsgate tug and lifeboat.

Great interest has been aroused at Moscow by the ceremony of regilding the huge crosses surmounting the cupolas of the Church of the Ascension, where the Czars are crowned, in the Kremlin. The crosses are of copper thickly overlaid with gold, and the largest one, on the central dome, contains inside the copper cross an ancient wooden one. The entire fabric is being renovated and restored, in view of the ceremonial to take place there next spring. In all a surface of over six hundred square yards, there being five cupolas, has been covered with gold leaf, the total weight of which is about 16lb.

A committee meeting of the Urban District Council of Weston-super-Mare was held on Friday to receive and consider a report by Mr. J. Wolfe Barry, C.B., and Mr. Cuthbert A. Brereton upon the proposed construction of a low-water pier, two marine lakes, and a pavilion at Knightstone. The scheme was unanimously approved, the engineers were instructed to prepare the necessary Parliamentary plans, sections, and estimates, and it was also decided to take measures to procure Parliamentary powers next session.

The assembly-room at the Shirehall at Hereford is about to be enlarged, at an estimated cost of £2,500, from plans prepared by Mr. Arkwright, of that city.

A new co-operative clothing factory in Dryden-street, Kettering, was formally opened on Tuesday week. Mr. H. A. Cooper, of Kettering, was the architect.

During the past week one of the windows on the north side of the chancel of Kensworth parish church has been filled with stained glass. The window comes from the studio of the Stained and Painted Glassworks, Soho-square, London, and contains a full-length portrait of Dr. Claughton, first Bishop of St. Alban's, in full episcopal robes, wearing a mitre, and holding in his hand a pastoral staff.

The school board for Newport, Isle of Wight, adopted at their last meeting plans by Mr. E. A. Swayne for new girls' school at Barton, estimated to cost £1,800.

The rector of Dore Abbey, near Pontrilas, is issuing an appeal for £2,000 for the restoration of that well-known parish church.

The design submitted by Messrs. Boston, Menzies, and Morton, architects, Greenock, has been selected for a new Established Church to be built at Yoker to accommodate 800 sitters.

The town council of Bridgwater, at the last meeting, considered a report presented by a deputation that had visited the ports of Boston, Preston, and Stockton relative to the Parret Improvement Scheme. It was resolved to adopt their report and recommendation to the effect that Mr. W. H. Wheeler, engineer to the Harbour Commissioners at Boston, should be approached to ascertain on what terms he would be prepared to make a careful inspection of the River Parret, and prepare a report and estimate of the cost of what improvements were considered necessary.

The ceremony of unveiling the bust to the memory of Dr. Robert Brown, the famous botanist (1773-1858), was performed at Montrose on Friday. The bust is in bronze, the work of Mr. D. W. Stevenson, R.S.A. It is placed in a niche in the front of the house in the High-street, Montrose, where the great botanist was born. The edifice will probably be removed ere long, to make way for a new town hall, and in that event a permanent niche will be provided for the bust in the façade of that edifice.

A new board school for infants was formally opened at Eling, near Southampton, last week. It accommodates 213 children, and has cost for erection £2,070, besides £380 for site, or £12 10s. per head. The walls are of red brick, with Portland stone dressings, the gables being tile hung. The work has been carried out by Mr. T. J. Jukes, builder, of Freemantle, and the architects were Messrs. W. H. Mitchell, Son, and Gutteridge, Southampton. The school furniture was supplied by Messrs. Illingworth, Ingham, and Co., of Leeds.

The unveiling of the Empress Augusta's monument on the Opera House Square at Berlin took place on Monday in the presence of the whole of the German Imperial family. On the pedestal of the monument, upon the side fronting the street, is a tablet with an inscription. This is surmounted by a red cross, and above the tablet a crown and a laurel wreath. The long sides of the pedestal are adorned with reliefs of Carrara marble, symbolising the work of the Good Samaritan on the Throne. The statue is also of Carrara marble, and represents the Empress sitting in a throne chair. Herr Schafer was the sculptor.

The London and South-Western Railway will further extend their system into Cornwall on Friday in next week, November 1, as on that date they open their new station at Bodmin, seven miles distant from the present terminus, Wadebridge.

The accounts of the Metropolitan Industrial Dwellings Company show for the year a gross revenue of £17,349 and a net profit amounting to £3,696. The interim dividend paid in April absorbed £1,655, and out of the balance the directors recommend the payment of a further dividend for the half-year at the rate of £5 per cent. per annum, carrying forward £1,480 to next year.

In connection with the new line from Swansea to London, viâ Barry, Cardiff, Newport, and Oxford, which has been definitely decided upon, Parliamentary notices are being prepared. The usual notice was served on Saturday on all owners of property through which the line will pass.

The honorary president of the Glasgow Architectural Association has offered a prize of five guineas for the best essay on "The Distinctive Qualities of Scottish Architecture," open to all members of the Association. Essays must be sent in to 187, Pitt-street, Glasgow, on or before March 31, 1896.

The Roman Catholic church of St. Kevin, at Dublin, a Gothic stone edifice, built from the designs of Mr. G. C. Ashlin, of that city, has just been reopened after internal decoration, the addition of carved oak screen inclosing the sanctuary and choir, and of three side altars and a shrine, and the filling of three windows with stained glass.

After undergoing improvements and renovation, Brynford Church was reopened on Sunday, the preacher being the Bishop of St. Asaph.

The Roman Catholic Cathedral at Waterford was reopened last week, after the completion of improvements carried out at a cost of £5,000. These include a new western façade of limestone, with Portland stone dressings. The front, which is Classic in character, is surmounted by a pediment. Above the doors are carved the Papal arms, the bishop's arms, and the Passion scene. The subject of the carving on the tympanum is the Most Holy Trinity, and the statues on the pediment represent respectively St. Carthage and St. Paul.

The supply of properties on sale at the Auction Mart last week was limited in quantity, but successful results have been quite up to a good average. The aggregate amount realised was £40,242, which, in the absence of large items, is fairly satisfactory.

Many ratepayers of Southport have inspected the plans of the proposed pavilion on the sea side of the Marine Lake, now on view at the Atkinson Art Gallery in that town. The accommodation suggested (for 1,430 persons) was generally voted far too small, the opinion being in favour of 3,000, the extent of the latest pavilion at Blackpool, that on the Victoria Pier. Such a pavilion would cost about £15,000.

The Duchess of Sutherland opened on Friday the new harbour which has just been completed at Golspie, N.B., from plans by Mr. James Barron, M.Inst.C.E., Aberdeen. The pier has been constructed under the Western Highlands and Islands (Scotland) Act, at a cost of about £2,300. The contract was secured by Mr. William Morrison, Stornoway. The new pier has been erected on the foreshore of Golspie Bay, and in proximity to the fishermen's dwellings. It extends seawards in a southerly direction for a distance of 240ft., thence in a westerly direction for 80ft. The pier is built of timber piles with stone hearting, and gives 640 lineal feet of quay berth for boats and vessels.

The chapel attached to All Hallows' Roman Catholic College at Dublin is about to be rebuilt from plans by Mr. G. C. Ashlin, of that city.

The Heath Town Urban District Council have agreed to purchase for £625, from Sir A. Hickman, M.P., 12a. 1r. 18p. of land at Nechell-lane, Wednesfield, on which it is proposed to deal with the sewage of Moseley village, which will flow by natural gravitation on to the land, and no pumping machinery will be required. Mr. R. E. W. Berrington is the engineer engaged to carry out the work.

The parish church of St. Cuthbert at Clungunford, Shropshire, was reopened last week, after complete restoration and redecoration. The fabric had fallen into decay, but has been repaired at the expense of Mr. J. C. L. Rocke, J.P., of Clungunford House, who has also given the organ, built by Mr. J. J. Binns, of Bramley, Leeds, at the cost of £1,000.

A Baptist chapel seating about 500 people is about to be built on the Grove Estate at Lowestoft.

The new Roman Catholic schools of St. Mary and St. Edward at Silvertown have been opened by Cardinal Vaughan. The schools will accommodate 165 boys and 165 girls, and are situate next to the old schools, facing Drew-road. There are two rooms 58½ft. by 21½ft., and two classrooms 21ft. by 20ft., with hat and cloak rooms and lavatory. Over the entrance doors are niches containing figures of the patron saints, Mary and Edward, and each gable is surmounted by a stone cross. The cost has been £6 10s. per head.

On Saturday afternoon the members of the Helensburgh Antiquarian Society visited the recently discovered hill fort of Dumbowie, near Bowline. The fort was discovered by Mr. Donnelly, and is being excavated under the auspices of the Helensburgh Society. Dr. Christison considers the find a most important one, and, on his advice, all the earth in the interior of the fort is being carefully sifted, and already several objects of interest have been found. The fort is circular in form, and the interior measures 32ft. in diameter. The walls show an average thickness of 13ft. The fort occupies a commanding position on the top of Dumbowie Hill.

Miss Alice Jane Penrose, the youngest daughter of Mr. F. C. Penrose, F.R.S., P.R.I.B.A., of Colebryfield, Wimbledon, was married on Saturday last at St. Mary's Church, Wimbledon, to Mr. Arthur George Milton, son of Mr. T. J. Milton, the British Vice-Consul at Athens.

The first of a series of Glasgow Corporation art lectures was given on Saturday evening in the Art Galleries, Sauchiehall-street. There was an unusually large attendance. Bailie Shearer was the lecturer, his subject being "Old Glasgow."

In his quinquennial appeal on behalf of the Lichfield Church Extension Society, the Bishop of that diocese states that during the 60 years of its existence the society has raised £230,889 for church work, and he cannot now appeal for less a sum than £20,000 to carry on operations for the next five years. The urgent needs of the diocese are 14 new churches, 10 churches to be enlarged, 110 mission churches, and 45 parsonage houses.

Under the direction of Mr. F. Brady, the company's engineer, the South-Eastern line is being widened from a point close to St. Saviour's Church, Southwark. Crossing the Borough High-street, where some houses have been demolished, as also several shops in the station yard, in order to carry the line on arches, it cuts through the walls of the original London Bridge terminus into the new London Bridge station, the object being to construct a second down line between Cannon-street and London Bridge stations. At present there is only one set of metals between these points for the down traffic. When the work is completed, one of the present set of up metals will become a second down line, and that now in course of construction will be the second up line.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2130.

FRIDAY, NOVEMBER 1, 1895.

THE MULTITUDE OF COUNSELLORS.

"EVERY young man," it was once said, "wants to be an 'Admirable Crichton.'" He sets out with the ambition to know everything and to excel in everything. The result is that he is perpetually being disappointed. One rival surpasses him here and another there, and he finds in time that instead of being pre-eminent all round, he has nowhere risen even as high as mediocrity. So it has been; so it will be; so, perhaps, it is best that it should be, for few people are clever enough to profit by anybody's experience but their own. "I cannot let you go to the ball; I have seen the vanity of such things," said the old lady to her daughter. "Well, I want to see the vanity of them too," was the very reasonable reply. And, perhaps, in the long run, it is as well for the architectural student to begin by taking all knowledge for his province, all art for his field of action. If it is, he is fortunate in the times on which he has fallen. He has unprecedented opportunities just now for "seeing the vanity of it."

Listen to the voices that are calling to him as he enters on the studies of another session. They come from all quarters, and they all have something plausible to urge. "Whatever else you omit," says the Institute, "you ought to prepare for our examinations. You ought to do it both for your own sake and for the sake of your profession. It has been an open profession too long. With its vast public importance it should not be liable to be disgraced by anyone who may be pleased to take an office, put up a brass plate, and describe himself as an architect. Of course, there are true architects, of high culture and great abilities, who have come in so. But for one of these there are twenty specimens of ignorance and incompetence, who would have been kept out if examinations had been compulsory, and these are the persons who discredit us with the public. We mean, henceforth, to exclude them from the Institute, and many of us hope hereafter to exclude their successors from practice. When that is done, to be an architect will put a man, as it should do, on the same level as to be a barrister or physician. Now, if our examinations were set up for this end alone—namely, to insure that every architect shall be a competent man and a man of education, you ought to pass them, even if they did you, personally, no good. But the probability is that they will do you much good. Their opponents talk as if they involved, as many examinations do, little more than mere cramming. But you will find that this is not so. The final examination, in particular, deals largely not only with the power to remember, but with the power to plan and design, and no amount of 'cram' will help you there. The subjects which have to be learned are all, or nearly all, those of which you ought in any case to know something. In preparing for examination, you will take them up methodically, and in order, instead of partially, and half accidentally, as you probably would if you waited till you found the need of them in your work. They will now all be brought to your notice in good time. If something out of what you read up for the examinations should subsequently fade from your mind, you will at least always know where to find it when you want it; and in your future career you may want it at any moment. We examine you, moreover, not in mere book-knowledge, but in drawing and in the details of styles, in construction, the strength of materials, and the calculations of strains, in the preparation of contracts and specifications, and the mode of controlling actual work. There are very few of these things which you will not need, if you are to be an architect at all; and seeing you will find it imperative to learn them, it will add little to your labour to be examined in them also."

All this sounds reasonable enough. But then comes a voice from another quarter—the quarter, one may term it, of the Arts and Crafts. "All this," it says, "will not make you an architect, except on paper. You may learn by means of it what real architects have done, and you may make feeble repetitions and rearrangements of their details; but you will never equal them, or be worthy of being named with them. The evil of it is, that it keeps you at arm's length, or, rather, at miles' length, from the materials you are dealing with. It encourages you to sit in your office and design ironwork, say, though you never shaped a piece of iron, nor welded one, and though you do not know, therefore, why the workmen of artistic times adopted certain shapes in iron and avoided others. It teaches you to proceed in the same far-off way with your woodwork and your stonework, your brickwork and your plastering, your glass and your plumbing. So that you either go on copying for ever what more practical men invented, or you invent things which are costly to make, and unnatural when made. It keeps you, in short, at a desk when you ought to be in a workshop. It puts the ruling-pen into your hands when it should put the hammer and the chisel and the tongs there, and it will keep you all your life in the miserable position of trying to get your thoughts made into visible form by workmen who neither understand them nor sympathise with them. Come to us, and get in touch with the things you are trying to do. Learn what it feels like to work wood with the grain and against it; what it is to turn and twist and fashion red-hot iron bars. Let us see you make a solder-joint, and float and set a ceiling, for when you have got as far as these things it is just possible that you may direct to some purpose the workmen who have passed their lives in doing them."

The student naturally feels that this gives him pause. But as he stands, revolving many things in his mind, he is startled by a third utterance, louder and more positive than the others: "Now we shall see," it cries, "whether you are a fool, or a young man of sense. What are Arts and Crafts to you, or Examinations either? The only question is, What pays best? The public will pay for what they want, so the first thing you have to do is to study the public. Depend upon it, they don't want architecture at all. What they want is what brings them in £ s. d. You will soon find out for yourself what that is. When their neighbours encroach on their ancient lights, for instance, there is £ s. d. in it, and if you are an authority on ancient lights, they will come to you, and ask for your help in extracting those three letters for them out of the encroachment. If a street or a railway is going to take down their premises, they are in the same case, and they will come to you, if you are an authority on the value of premises, or even if you can swear, without blushing, that you understand it. Then they are often at loggerheads with local authorities; new building acts, and sometimes old ones, too, are hard upon them, and stop them from doing lucrative things which they wanted to do. Then is the time for you to come to their resue. Show them how to fight the Acts, or how to dodge the Acts, and you will not find them unwilling to pay your charges. Again, a great many building matters are now left to the discretion of councils and boards all over the kingdom. Somebody, for instance, wants to bring his premises forward, or to put up a public building with smaller means of exit, or worse staircases, or more risk of destruction by fire than the local rules and regulations permit. Well, the local authority were wide awake when they made the regulations. They reserved to themselves plenty of dispensing powers. You can see, therefore, with half an eye, that what you have to do is to get on terms, and keep on terms, with the local authority. In some towns it pays, in other towns it does not pay, to be an actual member of the Council or the Board; but it always pays to have influence with them in one way or another. Then the public will come to you and arrange terms with you, and you, by such means as you may find advisable, will make terms with the Board, and all will go well. The Board, your clients, and yourself will all be happy, and very likely even the public will not suffer; for even if you are dealing with a theatre, the chances are that there will never be a fire, after all."

Perhaps you will say that this is not being an architect, and that you want to be one. On the contrary, this is the very best way of being one. The public will see that you are a solid, sensible man, fit to be intrusted with affairs of importance, and they will intrust them to you accordingly. You won't know much about buildings, probably; but you can soon hire somebody who does. Keep him in the back office, get him to coach you up before you see clients or meet committees, and take care that all the glory shall be yours. You will go from victory to victory. While the brethren of the Arts and Crafts are drudging in their workshops, and spending all day, perhaps, on five shillings' worth of work, commissions for scores of thousands will come to you. You may, if you like, be a J.P., and perhaps an M.P. Possibly you may rise to be a potential Lord Mayor, or even an actual one, though "There's many a slip between the cup and the lip." In any case, you will be a successful man; and when you think of your clerk in the back office, who passed his examinations, and worked at his Arts and Crafts, you will say, with compassion for his misdirected abilities, "Alas! poor ghost!"

There is the hum of many voices in the background. "Sanitation," says one, "is the thing you should give your life to, for it is what the lives of your countrymen depend on. Nothing else is for a moment to be compared to it. Devote yourself to drains; put your soul into sewers; let your imagination revel in traps and bends, pans and siphons. So it will be well with you now, and hereafter you may be joined with those who will spread the refuse of towns over all the green fields of the country. Then as the fertilising fluid runs, black and slimy, wherever the eye can reach, and as its perfume overpowers those of useless things like may, and cowslips, and sweet-briar, you can lay your hand upon your heart, and say, "I, too, have helped in this glorious work. I, too, am a sanitarian."" "Never mind about sanitation," says another speaker; "style is the all-important question. Let your style be thoroughly English—which, you know, is the same thing as thoroughly Italian. Don't go to Spain for ideas; Spain is a foreign country. Copy what was done in the reign of that great Englishman, George I., and you will never be far wrong." "Don't waste your time on styles, but be practical," shouts another adviser. "See that contractors never impose on you. When you specify the best timber, mind that you get it. Study the brands, and be up to all the dodges of the shippers and importers. Watch every brick that is laid, and if you say there are to be no snapped headers, take care that there are none. Have the lime and sand and hair for the plastering measured and mixed before your eyes, and carry the same principle into every trade you deal with." But enough of the voices. The wise student by this time is running away with his hands over his ears like Christian in the "Pilgrim's Progress."

Still, he must take some course. Which is he to follow—examinations and Arts and Crafts, sanitation, style-fancies, or practical superintendence? There is something in them all; but life is short. One thing comes out plainly and distinctly from all this Babel of voices—namely, that the modern architect attempts and professes a great deal more than one man can know or do. The sooner he comes down from this untenable position, the better for himself and his clients. Even after striking out the so-called surveyor or building negotiant, who is no architect at all, there remain from five to ten varieties of architect, almost distinct enough to be made into species. To sort them out, and to set each of them to do the thing he is qualified for, and no others, seems one of the most urgent matters of business which are now beginning to demand attention.

INSTITUTE OF PAINTERS IN OIL COLOURS.

AMONGST a great deal of a commonplace kind, weak in sentiment and drawing, we may refer to a few of the more meritorious pictures which have been hung on the walls of the Piccadilly Gallery, and we are glad to notice that the Council of the Institute have wisely reduced the number of canvases by limiting the lines of pictures to two or three, thereby giving to those which are hung more wall space, and affording the picture viewer a better opportunity of examining the work. Frank Walton, the vice-president, has a broadly-painted view of "Gravel Pits" (4), and a landscape in which the yet leafless trees of springtime (20) have been delicately handled. The composition and the drawing of the foreground and branches are very effective, and the light and shade subtly rendered; but his chief work is in the Central Gallery (198)—"The Long Day Closes," a moorland track along which a solitary horseman wends his way between darkening hills. Robert W. Allan has a large landscape (11), this time not a grey Scotch scene, but a silver-hued wood, through which a river bends—almost Corot-like in its grey tones and delicate feeling. The large centre-hung picture, "The Golden Light," by Ernest Parton, is a soft and subtly delicate landscape. It is a river scene under a sunset sky. The trees and cottages are pleasantly painted, and the mannerism of Mr. Parton's work is not so evident. Another picture, "Tranquility," is also from the same hands. Fred. G. Cotman's "The End of Harvest" is somewhat hard in the foliage; the warm light of the setting sun which illumines the haystacks and meadow is strongly contrasted with the shadows. R. Thorne Waite, who has only one picture this time, sends a very admirable example of his powers as a landscapist, "The Water-Cart" (79), in which there is a sense of grouping and composition, and "values" of light and shade. There is a breezy freshness, too, about the landscape—the pond, the dark trees, and the rough common beyond—which charms. We must not omit to mention also a landscape sent by E. M. Wimperis, "A Dorsetshire Valley" (88), one of the best works in the gallery, excellent alike in its grouping and handling of trees and distance.

Claude Haye's "Early Morning in the Meadows" is a study of sunlight and mistiness, rather spoilt by its over-greenness, and we notice also J. L. Pickering's study (97), J. E. Grace's "Early Spring," a delightful blending of browns and greens (142), and Hubert Marshall's strongly-painted "The Embankment in Winter," showing the New Scotland Yard building. Returning to subjects of another class, we notice Carlton A. Smith's "Breakfast over, Grace is said." The figures of the girls, the younger watching a kitten lapping milk from a saucer, the elder clearing away the cloth, and a dog watching his little feline companion with covetous eyes, are pleasing, also the management of light and colour. Some nice tone is seen in Alfred Withers's "Evening," and in "The Millpond" (9 and 18). "The Love-sick Poet," by John R. Reid, depicts a forlorn man in a Shakespearian costume seated on the bank in a wood; his meditative but miserable face rather suggests the caricature; the painting is hard. Chas. Kerr's picture of a lady reclining on a sofa with a cigarette in her hand is somewhat commonplace in conception, but the rich tones of gold and green are pleasant. A vigorous sketch of "Meadows" (21), by James S. Hill; the figure-studies of Harry Fidler (25), and H. Vincent Harley (26); the clever impressionist conception of Miss Amy Sawyer; Fred Morgan's "Good Yarn," a fisherman with pipe; Edwin Hayes's seascape (62), a fine study of reflected light and rolling waves; Lance Calkin's "A Sad Story" (73); Madame H. Ronner's kitten study (119); the excellent riverscape by James Orrock; Mrs. Edith Taylor's interior of the choir of Santa Maria Novella, Florence (102), are amongst the other pictures of note. The Hon. John Collier's "Hallow E'en" (82) is a clever melodramatic subject, apparently a suggestion from Burns. A young girl in her nightdress stands before a mirror, holding a candle in her hand; over the mirrored reflection of her terrified face she imagines she sees the shadowy countenance of a wooer. The reflection is not exactly accurate, but the conception is charmful, and the painter has cleverly portrayed the girl's expression. As a piece of illusion and reflection, the subject is delicately handled and painted. A subject by H. Fantin-Latour, "L'Aurore et la Nuit" (126), has very ably conceived "Morning," in garments of deep blue, chasing away "Night," draped in purple robes. The subject is poetically and unaffectedly treated.

The President, Sir James Linton, has, in the chief position of the Central Gallery, given us a large, nearly full-length study of "Portia," robed in a rich brocaded crimson silk. As a painting of the technical, the texture of the brocade, which hangs in massive and well-lighted folds lined with white fur, and other minor accessories of dress, the work has much to commend it; the hand resting on the portfolio case under her arm is modelled with much beauty, the pose is dignified, yet the face of the heroine is not quite the type of what we might have expected. His other work (180), "Newhouse Park, St. Alban's," is somewhat hard and uninteresting. Amongst the few principal works which attract attention in this gallery we may mention E. Blair Leighton's admirably executed "Portrait Study" of a lady with a book; the hands are delicately drawn, and the detail admirable. Arthur Barrington is one of the few who can impart to the stern, hard realism of life true poetry. His picture of "Baby," a very beautiful study of an infant in cradle, watched over by a fond mother, in a humble interior, lighted through a window which casts deep shadows, is masterful in drawing and chiaroscuro. Another study of contrasted light and shadow is No. 229, "Her Only Legacy," where in a dimly-lighted room a widowed mother tenderly nurses a child; and a third (277), "In Poverty, Hunger, and Dirt," shows an almost darkened, squalid room with the glimmer of a candle; on the table the heartbroken woman flings herself in abject despair. It illustrates Hood's "Song of the Shirt."

T. B. Kennington has lately taken to a quite different class of subjects; from scenes of pathetic poverty he gives us studies of fashionable society. His "Forbidden Fruit" (162) is a trio of lovely girls in evening attire enjoying a little gossip. One is reading a paper, her dark eyes turned towards someone. The modelling of the faces and shoulders is excellent. His study of a lady's head and shoulders (24) is also effective. John R. Reid has lately added to his brilliant studies of coast and fisher life that of strolling players. His principal picture, "The Bread-winner," shows a young girl in ballet dress dancing before her father and mother, who are seated under a tree—admirable, as usual, in its grouping, technical qualities, and brilliancy of colour. His other subject, in the next gallery, "Spring's Delights" (333), is full of sparkle of light and colour. "The Skipper's Daughter" (242), by Edgar Bundy, is remarkable as a study of facial expression and drawing, and his group of figures in this little picture puts us in mind of the Dutch master, in the fine execution and detail. Frank Brangwyn, in "Funchal," retains the manner of the Glasgow school; it almost resembles a piece of tapestry in its mosaic-like flatness. John Fulleylove has two charming studies of colour and architectural grouping (156 and 169), a bit of St. Mark's and its columns. W. Logsdail's "Church of the Misericordia, Venice" (179) is a beautiful study of architectural detail and colour, the blue sky and canal contrasting with the sunlit brick church. T. Graham's "A Sailor's Wife" is very pathetic and well told—a young wife holds up a lamp from a jetty amidst a dark tempestuous sea, as a beacon; a streak of crimson light marks the horizon, showing the close of day. Montagu Smith (188), Jas. S. Hill (189), and George Wetherbee (190) have good work. A decorative panel of "Roses," by Miss Emma Cheyney (199); a delicate study of sea and beach by F. J. Widgcry (200); and the clever small subject by Frank Dadd, "Do You Quarrel, Sir?" (211), in which the drawing of figures and their expressive gestures and motion are painted with exquisite precision and detail befitting the subject and size—are interesting. E. M. Wimperis is again at his best in "The Way Across the Fields" (213), a charmingly-painted landscape (and we may here call attention to the same painter's collection of sketches at Dowdeswell's Gallery). Hugh Carter (223) has a clever piece of grouping and colour. Many good qualities are seen in J. L. Pickering's "At Evensong," a delightful little sketch; and we may mention works by A. H. Peppercorn (280), Mrs. Harry Goodwin, T. Hope McLachlan, and Geo. C. Haité.

The East Gallery may be dismissed with a brief notice of two or three painters. Leslie Thomson's large sunset seascape, "Sirens," with a group of those legendary lurers on the shore, is delicate in colour, in the gradations of red and grey, and in the general composition. Near it hangs Anderson Hague's "In the Barley Field," a landscape, full of rich colour and tone, and firm, solid handling. T. B. Kemington's large picture in the centre, "The Lure," scarcely comes up to the conception of the painter's idea. The well-modelled maiden or siren, who is luring into destruction a man on the shore, before whom wreckage is seen, is finely painted. Behind her one sees in shadowy form a skeleton. All this is cleverly depicted, but the composition lacks power and motive. We notice also a fine piece of colour and atmosphere in E. Hayes' "Old Calais Pier," and some powerful rock painting by J. Farquharson (396). Arthur Hacker's beautiful figure subject "Meditation" (415), a nun passing through a meadow illumined by gleams of light, is one of the best works—the benignant and kindly face is tenderly painted. J. L. Pickering has here also a vigorous piece of brushwork in his "August" (419), and we note a nice study of "Lemons," by Mrs. R. H. Wright (421), in which the modelling and rotundity of the lemons equal the quality of tone. C. E. Johnson's large and bold "Rock Scenery, Isle of Skye" (447), John White's "The Brook," are among the few able works in this gallery.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

ALTHOUGH many mediocre works find a place on the walls of the Suffolk-street Galleries, there is a goodly display of pictures of more than ordinary merit and interest. Sir Frederic Leighton's sketches, made during his recent visit to Algeria, on the screen, have much interest. They form a group of landscape studies, many of architectural interest, as "Street in Rhodes," "Mosque, Damascus," "Moorish Gateway, Ronda." The landscape sketches are broad, and include a large number of coast views, rocky scenery, and are "notes" for more finished pictures.

On the end wall of the central gallery, E A. Fellowes Prynne has a circular canvas, entitled "Ecce Ancilla Domini," a decoratively-conceived subject. The face of the kneeling virgin before the angel, who holds a lily in her hand, is beautiful in its expression, and the artist has endowed his work with spirituality and tenderness of feeling. The subject must be viewed as rather an ecclesiastical panel than a picture. Edward H. Read's sombre landscape above has much powerful painting; there is a true sentiment in the dark landscape, with its masses of trees and roadway, and the glimmering streak of red light on the horizon. "Where the Bee Sucks" (21), by F. A. W. Armstrong, is a pleasing study of a corner of meadow and flowering weeds. No. 17 in the corner is a large picture of three ladies engaged in criticising a picture in an art studio. The drawing and colour, in a rather subdued key, have good qualities; but why so large a canvas for a picture of this kind? Over the fireplace are several small studies of more or less merit; we notice a study of a head, "Neræda" (40), wearing a chaplet of flowers, set off by a white marble frieze; also a clever study of "Old Highland Hut," by Arthur Ryle; a sketch by Sir Frederic Leighton, P.R.A., "'Twixt Hope and Fear," and another for his large picture of "Flaming June." A very delicate study of colour-blending, a harmony of white and yellow, may be seen in R. Machell's "Chrysanthemums" (48) and E. Gouldsmith has a vigorous piece of sea-painting and surf. The incoming breakers reflect the rosy and golden hues of the setting sun. Mr. Cayley Robinson has one of his quaint and romantic fantasies, "The Beautiful Castle" (56), a piece of pre-Raphaelism. In an apartment of a castle tower sits a disconsolate-looking maiden with red hair and of rather weak face, gazing into a well-like basin on the floor, her face mirrored in the still water, while through an open gateway, with the word "Romance" over it, can be seen an armour-clad knight on horse. The conception and scheme of colour, with the golden beams of sunlight coming through the barred windows, have a strange charm. J. E. Grace contributes several of his delightful sylvan landscapes. "Spring," a sketch of golden gorse, and "A Surrey Homestead," are admirable in tone and sentiment; in the latter the cottage and reflection of trees in the water, are two out of many subjects which he sends. Geo. C. Haité's "Cornfield by the Sea" has also breadth and agreeable colour. One of the best figure-subjects is Leonard Watt's "Prayer" (87), a saintly maiden with a subtle serenity of countenance saying her rosary at a prayer desk. Her head is surrounded by a halo, and her white sleeves and low-cut dark-blue bodice, with the mosaic panel background, give a decorative value to Mr. Watt's work. The pure scheme of colour, modeling of figure, and balance of composition, are singularly attractive, and mark it out for the central position assigned to it. Above it F. A. W. Armstrong has another powerful landscape, "A Gloucestershire Pastoral." The president, Wyke Bayliss, is represented by several architectural subjects and sketches, all characterised by his usual felicity and pictorial qualities. His pair of small interiors of Westminster Abbey and St. Paul's Cathedral (St. Peter and St. Paul) are very charming in their detail and colour harmonies, and happily chosen as subjects. "At the Cathedral Door" (118) is a larger and more imposing work of the fortified church of Aix-la-Chapelle, a beautiful example of a vaulted entrance vestibule, with massive ribs rising from the floor, and its bays pierced with rich traceried windows filled with painted glass. The drawing, gradation of light and shadow, and the subtle harmony of colouring are equal to this master's best work. The large landscape which hangs opposite the fireplace, "The Last Faint Pulse of Quivering Light" (112), by F. Spenlove-Spenlove, is one of the most noteworthy. The coast and bay, reflecting a fine sunset sky, over which small sunset clouds are seen, are painted with masterly breadth; the atmospheric effects are especially truthful. In the corner of gallery hangs a large blue canvas of a not very obvious meaning, taken from Rossetti's verse, by William Hunt. The shadowy female figures, one standing erect the other lying in a meadow of poppies and briars, are not pleasing, and we cannot call it a happy or an attractive conception. The same painter's shadowless green pastoral in the South-East Gallery, and Charles H. Eastlake's fine piece of impressionism, the latter a refined study of sunlight and atmosphere, are the most noticeable works in this room. Sydney Muschamp has a clever historic costume study (137), and Albert Kinsley a nice landscape.

We cannot quite discover the meaning of R. Machell's shadowy symbolic composition (183), "'Twixt Priest and Profligate," inspired from Swinburne's poem, except from the lines in the catalogue. The composition has merit, but is less satisfactory than the painter's "Death Wooing" (284), in another room, which has a symbolic significance and decorative scheme of colour. Adam E. Proctor's "The Apprentice" (173) has many good points. The drawing of the lad with the model of a boat and the scheme of colour are happy, qualities seen in his "Shepherd Boy" (186). Sir Frederic Leighton's "Study for Fresco on the Royal Exchange" is worth notice, and John Olsson's large "Sapphire Sea" (196) with rocks. In the North-West Gallery we see several water-colour drawings and sketches. Ernest George has a very fine sketch, full of colour and transparency of tone, of "A Northern Port" (207); but his chief drawings are "The Rood Loft, Ste. Madeleine, Troyes" (217)—a charming piece of drawing and colour of the beautiful canopied rood-loft; "Old Houses, Hamburg," and "Afterglow, Algiers" (246) are other admirable sketches. J. Finnemore's "A Point of Honour" (261) is by far the strongest figure composition in the gallery. The moment chosen between the duellists is critical, and the painter has shown a keen sense of action in the restrained combatant. There is wonderfully strong colour, too, in the work. R. Machell's "Magic Wand," near it, is also a nice note of colour; and we may mention a few studies over the fireplace—a head, "Maud," by W. T. Warrener; a charming piece of sunlight in Leopold Rivers' "Sunlight and Shade" (221); and studies by F. Spenlove-Spenlove (238), Albert Knowles (244), and F. Corbyn Price (225). Breadth and aërial tone colouring are qualities also in John Fullwood's "Wrekin Vale, Shropshire" (274). We cannot speak of other studies, amongst which we must not forget work by W. Harding Smith, Ayerst Ingram, and Sherwood Hunter; and also a very clever colour idea, "La Perle," by Hal Hurst, in which the iridescent hues of a pearl are skilfully idealised.

THE SOCIETY OF ARCHITECTS.

THE 11th annual meeting of the Society of Architects was held at St. James's Hall, Piccadilly, on Tuesday evening, the President, Mr. Edwin J. Hamilton, of Brighton, in the chair. Sixteen nominations for membership having been read, the following nine architects were elected as members:—Charles Henry Elford, 34, Cannon-street, Aberdare; Edward Hide, 17, Gracechurch-street, E.C.; Horace C. R. Hide, 17, Gracechurch-street, E.C.; Frederick William Hipkiss, Cliffside, Aberdovey; Henry Joseph Hollingsworth, 20, Old Cavendish-street, W.; Charles Orlando Law, 47, Loudoun-road, N.W.; William Ford Slater, Burslem, Staffordshire; Richard Harold Smith, Ravenswood-road, Redland, Bristol; and Ernest James Wellman, P.O. Box 1510, Johannesburg, S.A.R. Several valuable additions to the library were announced, and were acknowledged by a vote of thanks to the donors.

The scrutineers announced that the following had been unanimously elected as the officers and members of council for the year 1895 6:—President—Edwin J. Hamilton, Brighton. Vice-Presidents (two)—T. Walter L. Emden, London; Silvanus Trevail, F.R.I.B.A., Truro. Honorary secretary—Ellis Marsland, London. Honorary corresponding secretary—Major F. Seymour Leslie, R.E., War Office, Whitehall. Treasurer—H. G. Quartermain, Merton. Honorary auditor—W. R. Mallett, London. Council (twelve)—C. A. Bassett-Smith, London; Frank J. Brewer, F.R.I.B.A., Richmond; Ernest Day, F.R.I.B.A., Worcester; Edgar Farman, London; Arthur R. Finch, London; J. W. Frazer, A.R.I.B.A., Newcastle-on-Tyne; Robert Keith, president, Dundee Institute of Architecture; Henry Lovegrove, A.R.I.B.A., London; Alfred M Ridge, London; Francis J. Smith, F.R.I.B.A., London; George Thomas, local hon. secretary, Cardiff; and J. W. Walmisley, F.R.I.B.A., Southsea. Mr. Henry Lovegrove proposed, in hearty terms, a vote of thanks to Mr. Hamilton for his dignified, businesslike conduct in the presidential chair during the past year. He remarked that, at considerable personal sacrifice, Mr. Hamilton had come up to town to attend the general and council meetings, and had set an example of punctuality, courtesy, and promptitude which had contributed to the success of the society. Major Seymour Leslie seconded the motion, which was carried by acclamation. The President, in acknowledging the motion, thanked the members for his re-election, and proposed a similar vote of thanks to the retiring vice-presidents, Mr. Ernest Day, of Worcester, and Mr. George Highton, of Bedford. This was seconded by Mr. E. Tidman, and agreed to. A vote of thanks to the retiring members of council, Messrs. W. Allport, Herbert J. Jones, W. R. Mallett, and G. A. T. Middleton, having been carried by acclamation on the motion of Messrs. Manning and Tupper, the President moved and Mr. Lovegrove seconded a vote of thanks to Mr. Ellis Marsland for his indefatigable services as honorary secretary.

Mr. Marsland, in replying, said he wished to see the Society not merely prosper, but progress. He looked forward to the coming year with some apprehension, as they were about to lose the services of their secretary, Mr. Arthur Montefiore, who was resigning on account of the pressure of other engagements. An equally good successor to so excellent an officer would take a good deal of finding.

The President added his testimony as to the value of Mr. Montefiore's services to the Society, and urged members, especially those residing in London, to do their utmost to support the Society by regularly attending its meetings.

A short discussion followed on this point, in which Messrs. E. Hide, Tidman, Tupper, Leslie, Lovegrove, and others took part, and its consideration was referred to the council.

There has just been constructed at Totnes Weir a fish pass, which will enable salmon and trout to go from the tidal portion of the river Dart to the upper water for the purpose of spawning. The length of the pass is about 90ft., and it is divided into eight pools, each having a concrete floor 18in. in depth. The engineer was Mr. J. M. Martin, of Exeter, and the contractor Mr. Gibson; the cost was £450.

CLASSIC DETAILS AND THEIR APPLICATION.*

By G. A. T. MIDDLETON.

XVI.—FRENCH RENAISSANCE: GENERAL CHARACTER OF THE BUILDINGS.

IF, upon its first introduction into France, the Renaissance only affected minor details, this was not to last for long. Gradually, but surely, the buildings felt the new influence and succumbed. Had the works then being erected been military or ecclesiastical, the process would doubtless have been more gradual still; but at that time France was being covered with the great palaces, the châteaux of the rich nobility—no longer of necessity fortress dwellings, but houses for living in, and for the display of wealth and grandeur. For these, a new form of buildings, a new style of architecture, seemed well suited, and was made peculiarly so by the genius of the French architects.

To judge properly of what took place, it is necessary to compare the needs of the buildings with those of Italy at the same period. There the necessity for strength in the early palaces, fronting narrow streets, had led to simplicity of form, breadth, and dignity; while here, built for peace, and not for war, and situated amidst beautiful surroundings, the châteaux were naturally, if not necessarily, more broken and lighter in their design, more particularly as the Gothic system of promiscuous planning was still in vogue. Place the Maison Fontaine Henri, for example, beside any of the Italian palaces in Florence, Rome, or Venice, and the contrast is most striking. Here is a broken sky-line, with high-pitched roofs, tall dormers, and lofty chimneys, all in picturesque confusion, the only sign of the Renaissance, so far as a general view can show, being the introduction of a few small horizontal strings and an occasional pilaster. The general scheme is Gothic.

Slowly, quite slowly, the planning became more symmetrical, an axial line being used, and the parts balanced and eventually paired, on either side of it, the Orders at the same time being introduced, not obtrusively, but in slightly-projecting pilasters and cornices, the pilasters being panelled, even when used externally, and the panels often enriched with carved scroll-work ornament of delicate design. Still, however, the high roofs, dormers, and chimneys were in use, and remained so, giving a distinct character to the Renaissance buildings of France; but the high-pitched turret became presently the "pavilion" roof, and the chimneys and dormers were modified to agree with the general changes which were taking place. Presently these in-

cluded the introduction of formal applied Orders, superimposed, and following very closely the Venetian school in the richness of the decoration. A rusticated basement or lower story became common, this being reserved for stables and offices, and the main entrance being at the first-floor level, reached by an external staircase; and there would rise an Order inclosing two or three stories, or else superimposed Orders, carrying a well-designed modillioned cornice, above which rose the high roof, the dormers appearing in a range, generally just above the eaves; for a parapet was rare.

Then deterioration commenced, as it had done in Italy, with the over-employment of large ornament, with the broken pediment, with orders used where even in appearance they had no function to perform, and with the introduction of sculpture in most unexpected places. At the Château d'Anet there is a stag with the hounds following it climbing upon the top of the pediment over the entrance; and female figures in light costumes seated upon the sloping pediment of a dormer (whence, in reality, they would inevitably slide to the ground), are by no means uncommon. Still, the French genius saved the work from the extreme vulgarity of the Late Roman Renaissance, a subtilty of proportion prevailing, even in the most debased days, which gave charm to the whole.

In the smaller châteaux, where the cost had to be kept down, it is not unusual to find, even in the later times, that no orders are used, save, perhaps, to the entrance door, there being a heavy cornice carried round a low rectangular building, with angle turrets, which inclosed a courtyard—following very much the general idea of the Early Florentine palaces, or of the Gothic "keep," and being surrounded by a moat, as if partially for defence, like many of our English manor-houses.

The Château Mesnil Guillaume, near Lisieux, may be taken as a very typical example of this method of applying Classic detail to a general design of other origin.

CONCERT HALLS AND ASSEMBLY ROOMS.—II.

By Ernest A. E. Woodrow, A.R I.B.A.

It would, perhaps, be both instructive and interesting at an early period of these papers to consider how a small parochial room may have to be fitted up in various ways for a different entertainment each night of the week. In thus explaining a simple example, such as the one I have now chosen, I may help my readers to understand the more complex arrangements of larger buildings.

I am presuming that my diagrams represent a country parish room, in which on the first evening a Sunday-school tea or public dinner is given. The diagram (Fig. 1) shows the whole of the floor-space taken up with various tables and chairs arranged round them.

The next night we may suppose that "theatricals" are to take place in our village assembly-room, and that the parochial hall becomes a miniature theatre, with stage, proscenium, footlights, orchestra, &c., as Fig. 2. The changes from the tea-room to the theatre are many, and the fittings to take up and put down, unless specially made, entail a large amount of work.

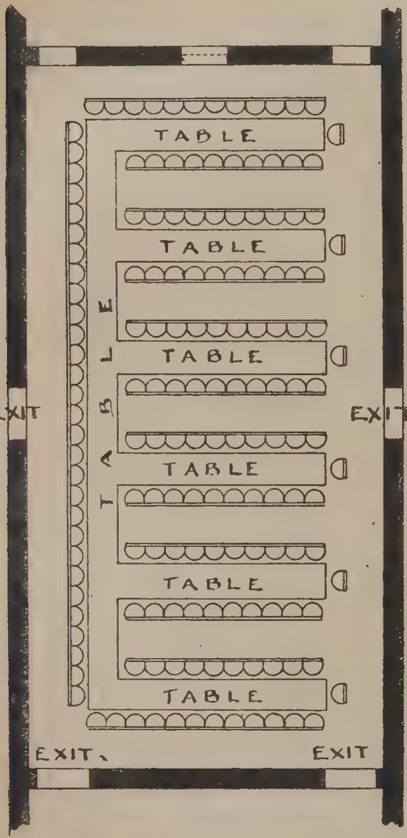

Fig. 1.—Room arranged for Teas or Dinners.

On the following day the room may be required for a bazaar. All the theatrical "fit-up" has then to be packed rapidly away; stalls such as we are all familiar with at bazaars and fancy fairs erected; and the hall arranged somewhat on the lines of Fig. 3. On the termination of the bazaar, the evening for the local choral society concert may perhaps follow, and the hall has again to be rapidly changed and refitted for orchestra, chorus, and audience. Fig. 4 shows how this has to be done.

Fig. 5 is an arrangement most likely to be adopted for flower-shows and small industrial exhibitions which we may suppose comes after the concert, while on the last day of the week the Saturday-evening Cinderella is nearly sure to take place; then the hall is cleared, the floor polished, and the arrangements made as Fig. 6. But after the ball, the caretaker has to provide for Sunday's meeting, and bring in the chairs and place them as in Fig. 7. This last plan is one that can also be used for lectures and political meetings.

Now naturally one would ask why do all these diagrams of internal fitting up of a small parish room concern the architect? They concern the architect to a great degree, because if he does not prepare his building and its surroundings so that the hall may be rapidly changed from day to day for one purpose or another, he does not meet the requirements of his clients in erecting a good parish room. Everybody knows that a local hall is sure to be used for all these purposes.

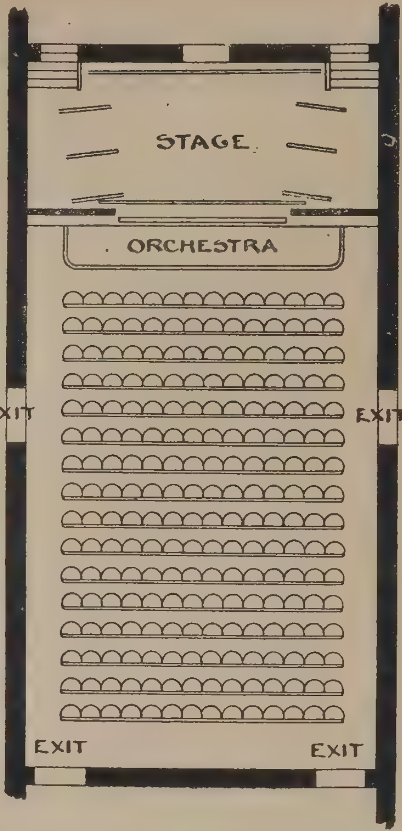

Fig. 2.—Room arranged for Dramatic Performances.

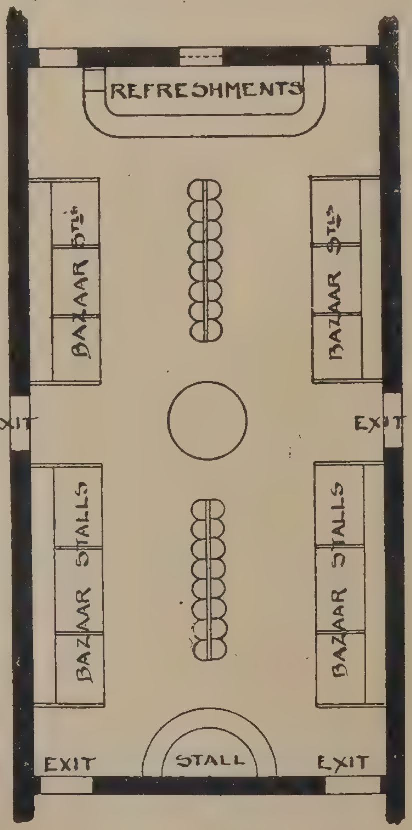

Fig. 3.—Room arranged for Bazaars.

The diagrams show that there are many special fittings which must be taken in and out of the room rapidly, and stored away in safe places—not in the passages and exits, as so frequently found, where no proper storeroom is provided for them; but in a room close to the hall—a room with plenty of daylight, which will not become a rubbish-heap, and a danger from fire.

It is a rule with the London County Council that the chair-store, or place for packing away the chairs. tables, platform, and stage, must be a fireproof chamber. Frequently the space under the platform is used for this purpose; it is bricked round, has a concrete ceiling under the floor of the platform, and is entered by iron doors in the front wall. At other times a trapdoor leads to a cellar under the hall. This is a very convenient way of rapidly removing chairs battened together in lengths, as insisted upon by the London County Council. The trap must have iron doors below as well as the wooden ones on the floor-level. This trap, however, is frequently a blemish in the dancing floor.

Special attention should be devoted to designing the "fit-up" stage for dramatic performances. So often are these temporary arrangements sources of the greatest danger, that too much care cannot be given to every detail in this respect. The proscenium must, of course, be of light construction, on account of the short time allowed for its erection and removal. The proscenium is generally erected with total disregard to the surroundings, and is too often an ugly piece of painting on canvas, representing ill-drawn and badly-painted, impossible bright yellow columns supporting a pediment of surprising detail, backed by what is intended to represent drapery in bright magenta colour. Why cannot a temporary proscenium be designed to harmonise with the architectural treatment of the room? The scenery must, together with the proscenium, be made uninflammable by applying some fireproof paint or solution, or by the use of asbestos canvas, or asbestos boards, as required under similar circumstances in Berlin.

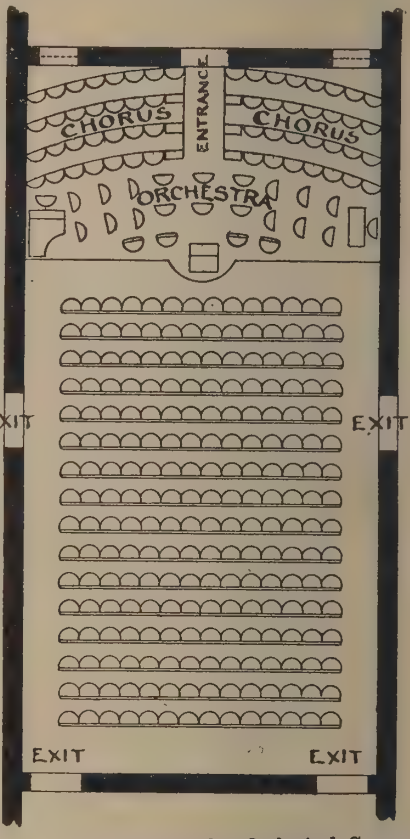

Fig. 4.—Room arranged for Orchestral Concerts.

In all cases of temporary stage-play licenses, granted by the London County Council, fireproofing the scenery is insisted upon. That authority strongly objects to the temporary canvas proscenium, and always recommends the adoption of a proscenium consisting of woollen curtains. The gas-fittings in a temporary stage are the greatest danger. Put up for one night, the same care is not taken as if they were put up to last for years; but as far as public safety is concerned, it is as necessary to take every precaution for a performance of one night as it is for twenty or more years. The risk to the public begins from the opening of the doors at the very first performance. The fittings must, therefore, be all protected by wire guards, and the connections must not be by rubber tubing, as is so frequently done. The favourite way of lighting such a stage is to push a piece of soft rubber tubing over the nearest gas-bracket, to let it run along the floor, with a great risk of it being trodden on, the light being extinguished, and an escape of gas being created. The gas is obtained for lighting the upper part of the scenes by connecting this tubing to some makeshift gas batten, without any wire guard, which batten is placed within a few inches of a ragged, old back-cloth, little better than tinder.

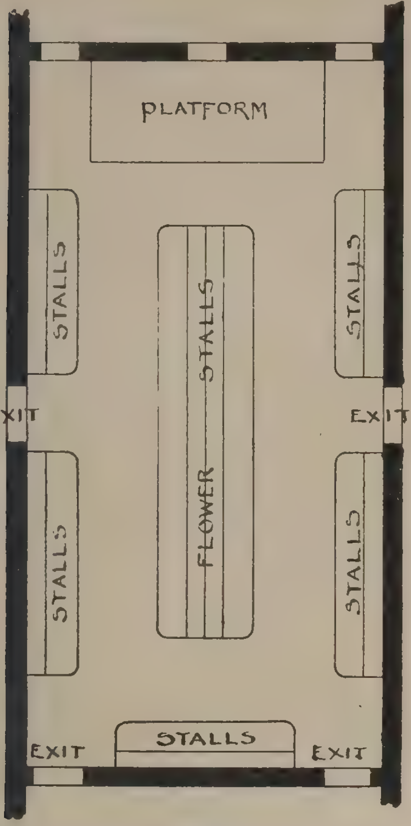

Fig. 5.—Room arranged for Flower Show or Exhibitions.

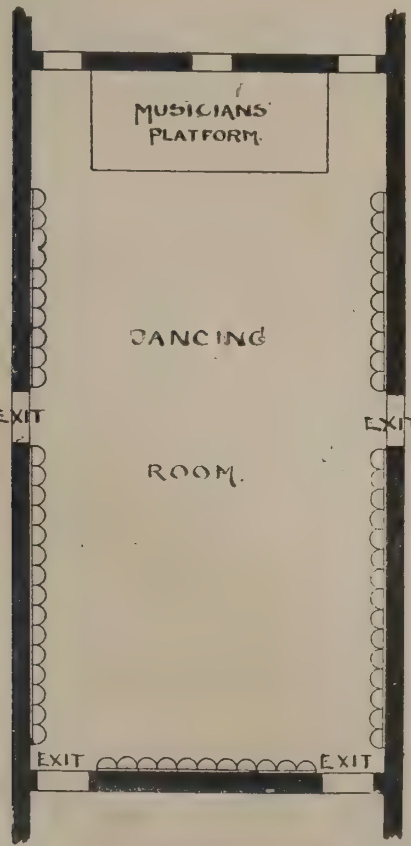

Fig. 6.—Room arranged as a "Dancing-Room."

It is really remarkable how fire is almost invited by the ignorance of people who provide amateur entertainments. I remember on one occasion visiting a ladies' school, where a dramatic performance was to be given by the pupils. The room was ready to be opened to the public, and the girls were very busy lighting their "footlights" when I arrived. These consisted of a row of the very commonest-made paraffin-oil lamps, placed on the very edge of their stage among a mass of flimsy "Liberty" drapery, and over the chimneys of which the tableaux curtain, as it was raised and lowered, came in alarming proximity. Much to the disappointment of the young performers, there were no footlights used that night. The effect of the performance may have suffered, but how would the audience have fared, I need scarcely ask, had one of these lamps been overturned by the curtain, or the curtain caught fire, as seemed almost a certainty?

The "fit-up" for the orchestra, when concerts are given, Fig. 4, should be specially designed, and arranged for by the architect: It has to be quickly put together, and it must be substantial, as it has to bear considerable weight. The breakdown of such a platform would cause great danger of life and limb, and probably create a panic amongst the audience.

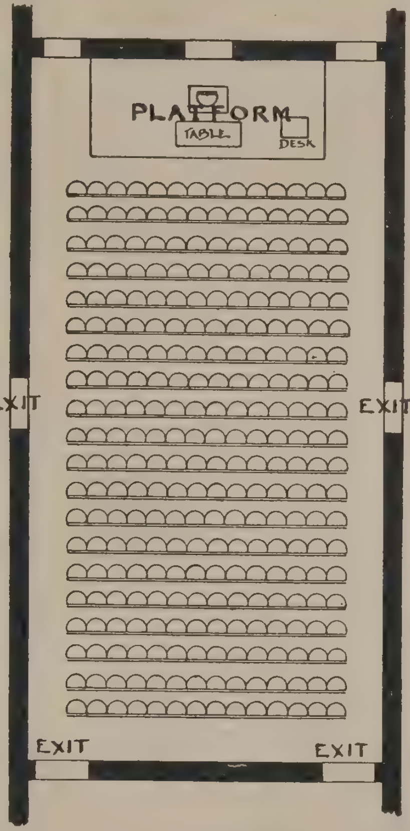

Fig. 7.—Room arranged for Lectures or Sunday Services.

In laying the floor of such a room as this, it must not be forgotten that it will be used for dancing, and therefore must be of a wood that will easily polish, laid with very narrow boards, most closely, with no open or gaping joints. What I maintain is that an architect should be alive to all these requirements, and should make provisions for them, to assist the hall-keeper in his task, to keep the exits ever free and unobstructed, to minimise the chances of fire, and, above all, to make free, straight, and easily-found exits.

All the provisions for the safe and rapid egress of a crowd are as necessary in this class of building as in a theatre or music-hall; indeed, they are more necessary, as a hall used for general purposes is never under the same experienced management as the theatre or music-hall; it never has attendants who know how to manage crowds; it holds more excitable audiences, and it seldom has the same provisions for safety.

It must also be remembered that parish rooms are more frequently used by children than grown-up people, that in consequence many more are packed into a given space than in a theatre or concert-room, and that the danger increases in consequence. Children in great numbers, without elder people to look after them, form the most difficult audience to seat safely, as some of the most dreadful examples of panic have shown even within recent years, notably the panic which occurred in Sunderland, and that at Belfast, where it will be remembered that some children tampered with the gas-meter, put the hall in darkness, and caused a serious panic.

◆

THE DESIGN OF SOLDIERS' BARRACKS.

[WITH ILLUSTRATIONS.]

Among the professional papers of the Corps of the Royal Engineers, Major Scott-Moncrieff, R.E., A.M.I.C.E., has printed an admirable and suggestive pamphlet, which he has been good enough to send us, on this practical subject. We think the following extracts will be useful, and those who need further information will do well to obtain a copy from the agents of the Royal Engineers Institute, Messrs. W. and J. Mackay and Co., of Chatham. Sanitary science has of recent years made many notable changes in the design of houses for all classes of the community. In towns the tendency is, wherever possible, to build in rows; in crowded streets recent legislation has decided what shall be the limits of interference with light which the mass or bulk of one building shall present to the windows of another. The tendency is in the direction of more room, more sunlight, more attention to proper provisions of fresh air, good water supply, adequate sewerage. Increased knowledge has had its effect in the design of recent barracks, and the improvement of those barracks which were built in days when ignorance prevailed alike in military and civil life. In military life we are, fortunately, free from the incubus of passive obstruction which greed or love of gain presents to the sanitary reformer in many cases in civil life. We have, on the contrary, the assistance which public opinion in the service or in Parliament always gives to any scheme or sensible suggestion for improving the condition of the soldier, and we engineers invariably have with us the strongest support alike from the medical authorities and from generals in command. Financial considerations sometimes limit advancement in this direction. It must be here premised that sanitary engineering does not merely mean sewerage. It means a great deal more. It includes also water supply and lighting, ventilation and warming of the dwellings within, free access of air and sunlight without; it includes proper provision for the cooking of food and ablution of the body. All these matters must be taken into account and combined before we can adequately consider the question of design. In addition to all these the architect has to consider the question of art and beauty in the work which he plans. In the suggestions made in this paper no question involving architectural adornment will be considered. The military engineer, who has not been trained to art, has to consider questions of economy in construction—that is to say, that, having a large number of similar buildings to construct, he must consider how he can produce his design with the least expenditure of material. Further, the engineer has to bear in mind military questions—e.g., how discipline shall most easily be administered, how parades shall be carried out, and how tactical units shall be conserved. A plan of a barrack adopted as a type should be capable of such alterations as will, without change of general design, admit of its being adapted to changes of site or climate. It would, obviously, be contrary to common sense to build the same barrack, exact in every respect, at Cork and at Aberdeen, or in a warm, sunny valley, and on the top of a ridge, such as that at Inverness, where the N.E. wind whistles across the Moray Frith. But the same type may be followed if certain modifications be introduced suitable for the local circumstances of the case. A type plan should also be capable of extension, so as to suit the larger amount of cubic space required for warm climates. Finally, and, perhaps, most important of all, the type has to be adapted to the British soldier. One does not wish, on the one hand, to give the men unnecessary luxuries such as they are accustomed to in civil life; on the other hand, the wish of all

officers is to train the men in habits of cleanliness, self-respect, and sobriety. The barrack must be designed to this end, so that it may be easy for a man to be cleanly, in person as well as in outward appearance, and that he may have a reasonable amount of comfort in his habitation. Much attention has of late been paid to soldiers' diet, and, perhaps, a little study may, therefore, be devoted to his dwelling. The object of this paper is to examine existing types and proposals, criticise them—in no unfriendly spirit, but with a desire for public advantage—and to make some suggestions which may possibly, if not considered suitable themselves, lead to others of greater practical utility. To recapitulate the necessary conditions :—(*a*) The barrack must be sanitary as regards sewerage, surface drainage, water supply, light, air, ventilation, warming, access to cook-houses, and these must apply not only to each single block, but to all in combination. (*b*) It must be economically designed. (*c*) It must be adapted to military requirements. (*d*) It must be as simple in design as possible. (*e*) It must admit of small modifications to suit local requirements. (*f*) It must be adapted to the wants of the soldier. The Aldershot type is that adopted in the Stanhope Lines at Aldershot, recently built

SUGGESTED TYPE DESIGN BLOCK
OF
MARRIED SOLDIERS QUARTERS

FIG. 6.

(see Fig. 1). These barracks are two-storied. The blocks run east and west, so that one side of the block rarely gets any sunlight at all. The accommodation is so arranged that in the event of an unusual number of men being absent, as may happen during the furlough season, the end portion, or "hammer-head," may be closed entirely. During the period when the barrack is full, those men who live in the "hammer-head" must necessarily pass through the other room to reach their own. Hence the other room becomes a thoroughfare, and the men who occupy it have more than their own share of dirt to clean. On the other hand, they are better off as regards their food than the occupants of the end, because they are a little nearer the cook-house; although, in many blocks, the dinners must, in either case, inevitably be cold, for the cook-house is some distance away, and is not reached by a covered passage. In this type of barrack the soldier sleeps and eats in the same room. He has cupboards in which to keep eatables, but the fact of keeping food in a sleeping room is condemned by medical experts as bad for the food, and unwholesome for the sleeper. There is but one entrance and one staircase to the block—an obvious disadvantage. Latrine accommodation is provided in separate buildings from barracks. This type, although an immense advance on the old huts which it replaced, is not such as will convince us that the best design has been obtained in it.—The next type to be considered is that shown by Fig. 2, proposed by Mr. Marrable, district surveyor, R.E. civil staff, in a paper entitled "What a Barrack Should Be to Meet the Requirements of the Age," published in the occasional Papers of the Association of Surveyors. He proposes to build three-storied barracks, and accommodate 100 privates on each floor in little rooms of 10 men each, leading off a large central corridor, which serves as dining-hall. The cook-house, ablution-room, latrines, and urinals are brought under the same roof and the same floor, and he provides a sleeping-room for four N.C. officers in another room, also on the same floor. There are also other conveniences allowed, such as company stores, pay-offices, &c. It offends the canon that the design should be simple. It would, if built, result in a large building, occupying much area, with many deep recesses or dead angles, where air would stagnate and sunshine never reach, and where the rooms would be dark by reason of bulk looming opposite to the windows.—In the type now submitted, shown on Fig. 3, and here termed the S.M.E. type (where, for the purposes of comparison, the drawings are all represented to the same scale), the general arrangement is one which will be familiar to all officers who have served in India, although there the type is usually confined to single-storied buildings. An endeavour has been made in this design to retain the best features of both the Aldershot and Mr. Marrable's suggestions, as well as the Indian type, and thus, by a process of evolution, obtain a type which will be an advance in the direction of general utility. The two-storied company block, as in the Aldershot type, is retained, and four dormitories each for a "section," or one-fourth of a company. These section dormitories are separated on each floor by a transept, to be used as a day-room and dining-room. It will, therefore, be possible to reduce the breadth of the dormitory to 18ft., and give the men more space than now obtains between their beds, because, as they will not have their meals in the barrack, all the width required will be for two rows of beds (say 13ft.) plus occasionally a barrack-table (3ft.) and 1ft. on either side. Each man still has his 60sq.ft. of floor space or 600c.ft. of air. The windows are arranged so as *not* to be opposite one another. The amount of light given is 1sq.ft. to about 100c.ft. of interior accommodation. Fig. 4 shows the elevation, and a more detailed plan of both floors of the same proposal with sections. Gas is the usual illuminant used in barracks, and in its present application to the soldier's room it can hardly be said to be either wholesome, cheap, or efficient. Among the many new inventions recently brought out it is difficult to say which is most suitable for the barrack-room, but possibly the Stott-Thorpe light, which combines brilliancy, economy, and ventilation (by carrying off the products of combustion through the ceiling), will be most efficient. It is proposed to use it in this case. Ventilation in this design would be partly insured by the use of foul-air shafts connected with chimneys. The Tobin's tube is probably the best form of inlet. Warming is proposed to be effected by fireplaces with ventilating grates. The cook-house is arranged on the principle advocated by Brigade-Surgeon-Lieut.-Col. Evatt, in his lecture on "The Sanitary Care of the Soldier by his Officer,"* where a preparation room outside of the kitchen and a scullery and a store are provided. In this cook-house there are baths for the men. The whole is connected by a covered passage with blocks on either side, and staircases lead to the dining-rooms on the upper floors. The details of latrine and urinals here demand some attention. Recent inventions in pedestal closets are of a description which makes misuse of them almost impossible. They may be nowadays formed of enamelled iron, with or without wooden seats, so as to be practically indestructible, and there seems no reason why a soldier should not have these provided for him, with water-waste preventive cisterns, controlled by the user of the closet. So much for condition (*a*), viz., sanitary design. As regards (*b*)—economy—we have to consider not merely first cost, but repair. This consideration points to the desirability in many cases of using some other material than slates for the roof. Tiles are now manufactured as light, as durable, as non-absorbent, cheaper, and far prettier than slates. Only those who have had to keep in repair acres of slate roofs in a stormy winter know how grievously extravagant they are. The floor may be either single or double, on steel joists, the latter for preference. The floor of the annexe should be of asphalte or tar concrete, as being pleasant to walk on and not absorbent. Each section room has a separate entrance and a separate staircase, its own ablution rooms, its own range of w.c.'s, and its own urinal. The author hopes and intends the type to be adapted to the ordinary wants of the soldier. Lord Wolseley says: "We pay our men so wretchedly that we can only hope to entice men to enlist by making them happy whilst they are with us, and the first step towards happines is to make men's dwellings bright and cheerful." But the question will probably be asked, "What about the expense of the whole as compared with the Aldershot type?" No doubt, at first sight, it appears as though the S.M.E. type must be the more expensive, on account of the extra accommodation provided, each half-company having its dining-room, and one-fourth of the cook-house instead of one-eighth. If we estimate the cost of the Aldershot block and the S.M.E. type, the latter will certainly be greater; but other matters also must be taken into consideration. To adopt this type to regimental requirements we have to consider the accessories—the canteen, sergeants' mess, quartermaster's stores, &c. Fig. 5 shows a suggested type plan for a Regimental Institute. The cost, however, can be ascertained approximately by cubing out the blocks and giving the same price per foot to each class. The cost for a soldiers' barrack per foot cube may be reckoned at 5d., whereas officers' quarters and mess amount to about 1s. On this basis the brigade of four battalions on the S.M.E. type would cost £236,000, and the Aldershot type £225,800, a difference of about £10,000, or about 4·5 per cent. This takes no account of any advantages gained in the S.M.E. type by simplicity of drainage, or any of the other points which may be put to the credit of this type. *Married Quarters.*—The improvement in the condition of the married quarters has, of recent years, been most marked. Instead of one room, where a man, his wife, and a maximum of three children were obliged to live, eat, and sleep in very questionable comfort, each quarter has now a kitchen and scullery, some have an additional bedroom, and some even have three living-rooms as well as kitchen and scullery. There are, however, here also certain disadvantages. Medical officers tell one that however great an improvement these quarters are on what used to be the type, yet they are wanting in sanitary efficiency. It is cruel to force a delicate woman to use outside latrines, and many of them dislike it from motives of decency. Again, if baths are considered desirable for unmarried soldiers, why should the married soldier and his wife or child not have one also? In the type proposed (Fig. 6), both these defects are altered; the quarters are divided by passages, which, to a certain extent, isolate portions of the building. The chimneys are brought to the centre of the building, where they ought to be, and not scattered all over the roof. Lastly, the water supply is continuous, laid on to each group of quarters from the outside main, and there are no huge cisterns overhead to cause misery in frosty weather, and involving girders and beams for their support. What the discomfort caused by these frozen cisterns was to the married soldier in the great frost of 1895 no words can depict. All this is important. If we are to induce sober, respectable men to stay in our army, to be the backbone of our regiments—*i e.*, the N.C. officers—we must make the married quarters decent, healthy, and attractive.

---

* *R.A. Institution Proceedings*, May, 1894. Anybody who wishes to read straight, sensible talk about the soldier should get this. The dining-room question is there discussed, and no doubt expressed as to its advantage.

OBITUARY.

Mr. W. H. Jobbins, the head of the Government School of Art at Calcutta, died on a homeward-bound steamer off Colombo on September 18, while on a visit to England. Mr. Jobbins, who was a native of Birmingham, was a student for a time of the Municipal School of Art in that city, whence he went to South Kensington, where he qualified as an art teacher, and was appointed second master of the Nottingham School of Art, under the late Mr. J. S. Rawle. While at Nottingham he developed such marked capacity as a painter that he gave up his appointment, and devoted his whole time to the practice of his profession. He studied in some of the best studios in Paris, Munich, and other places, and ultimately settled at Venice, where he worked for five or six years, in association with Mr. Woods, Mr. Fildes, and other eminent English painters. Some of his best pictures were produced in Venice and its neighbonrhood—two of them, "The Market Place, Venice," and the "Market Place, Sarravalte," both crowded with admirably-drawn figures, were sent home for the Royal Academy exhibition, and were well hung on the line. Mr. Jobbins also occasionally contributed to the exhibition of the Royal Birmingham Society of Artists, and still oftener to that of the Art Circle, of which he was a member. They showed great purity of tone, appreciation of colour, and the power to render atmospheric effects. They were also notable for skilful drawing of ships, figures, and architectural forms. About ten years ago Mr. Jobbins left England for India, having accepted the appointment as director of the Government School of Art at Calcutta, and that position he occupied until his death. His direction of the school proved most successful, the number of students having trebled during his tenure of office, and a new building having to be erected. Mr. Jobbins also took a large share in the direction of the Public Art Gallery at Calcutta, and in the promotion and management of art exhibits in that city and in other parts of India. He also continued the practice of his art, painting landscape works, and some portraits of British residents and of native princes. He was about 40 years of age, and leaves a widow and two young children.

CHIPS.

On Friday evening the Grimsby Master Builders' Association held their annual dinner at the Yarborough Hotel.

At the concluding meeting on Monday of the last city council for the old city of Liverpool, a report was read by Mr. H. Percy Boulnois, the city engineer, on the effect of the extension of the city boundaries. There will be added to the existing area of the city from to-day (Friday), 8,026 acres, making it 13,236 acres, exclusive of the river. There will be now 415 miles of road as against 138 miles previously, 663 miles of sewers, and 68 miles of tramways.

At the Estate Market, last week, the tone of business was firm, the aggregate for the week being £170,500.

The Ramsey Town Commissioners have applied to the insular legislature for power to borrow £5,000, to complete the sewerage scheme as laid down by Mr. Mansergh. When this is effected, Ramsey will have the benefit of a modern system of drainage, with an outlet far removed from the town itself. The work will be finished before next summer.

Arrangements have just been concluded between the North British Railway Company, the Fife coalmasters, and the Burntisland Harbour Board for an extension of Burntisland Docks, at a cost of about £250,000. The work will be carried out from plans by Mr. P. W. Meik, C.E., and Mr. R. Henderson, C.E., the harbour engineer.

Mr. Tewson held sales on Thursday and Friday last of part of the Ilford Park estate, which formed a portion of the assets of the Liberator Company. There were 182 houses, producing a gross rental of about £6,000 a year, subject to certain landlords' deductions, and these were offered in 128 lots, of which 127 lots were sold, realising a total of £74,453. The competition was keen.

Professor Blackie's grave, situated in the north division of the Dean Cemetery, Edinburgh, has now been marked by the erection of an appropriate memorial, consisting of a Celtic cross executed in red granite. The upper part of the design is enriched with Celtic ornamentation, while in a panel beneath is carved the following:—"John Stuart Blackie, Professor of Greek in the University of Edinburgh; born 28 July, 1809, died 2 March, 1895." The work has been carried out by Messrs. Stewart, M'Glashen, and Son, sculptors, Canonmills Bridge.

NEW HOTEL, FORT WILLIAM, N.B.—BARBARA VON VLAENDERBERGH, BY HANS MEMLINC.—TRUT HALL, NEAR HELSTON.—PROPOSED COUNTRY CHURCH, NEAR BRISTOL.—SKETCHES FROM KENT.—THE WEST SCREEN, MERCHANT TAYLORS' HALL.—STAIRCASE HALL, BOSTON, MASS.

Our Illustrations.

STATION HOTEL, FORT WILLIAM.

This hotel is in course of erection on a commanding and prominent site, overlooking the steamboat landing-pier and railway station at Fort William. It is within a distance of 200 yards of these important termini, and is approached by a good driving-road. The hotel obtains magnificent and extensive views of the surrounding country from Banavie and Ben Nevis in the east, to Coral Ferry and Ballachulish in the west. In fact, the scenery and district viewed from the hotel is unrivalled in the West Highlands. The grounds extend to over two acres, and are intended to be laid out with bowling-greens, tennis-courts, and pleasure-grounds. There is an excellent golf-course immediately behind the hotel. The building forms an oblong, measuring 105ft. by 90ft. in width. It contains a handsome coffee-room, with dining accommodation for 100 guests, drawing-room, smoking-room, double billiard-room, five parlours, 63 guest bedrooms, and extensive kitchen, servants' office, and manager's accommodation. A feature is made of the central hall, which measures about 35ft. by 30ft. The building is solidly built in dark grey granite, with Giffnock freestone dressings. The internal walls are in brick. It is intended to introduce an electric light installation for the whole building, and all necessary laundry and other requirements will be provided in a separate building. The estimates amount to £12,000. The following are the contractors:—Masons, Messrs. J. J. and P. MacLachlan, Larbert; carpenter, Mr. Wm. MacDonald, Inverness; slater, Mr. Don. Fraser, Fort William; plumbers, Messrs. Anderson and Nisbet, Oban; plasterers, Messrs. Fowler and Kennedy, Inverness; blacksmiths, Rose-street Foundry, Inverness; glazier and painter, Mr. Don. MacDonald, Inverness. The architect is Mr. Duncan Cameron, of Inverness, and Mr. John L. Anderson, of Inverness, is the clerk of works.

"OLD MASTERS" ON THE CONTINENT.—XXVI.

As our third example in this series from the collection of paintings in the Royal Gallery at Brussels, we give this week the celebrated portrait of Barbara von Vlaenderbergh, the wife of William Moreel, by Hans Memlinc, from a photograph by Franz Hanfstaengl, of Berlin. The portrait hangs, together with a companion one of her husband, in the Royal Museum Gallery at Brussels, and was executed in 1480. It is one of the few undisputed works by Hans Memlinc, or Hemlinc, of whom we gave a biographical notice in our issue of November 3rd, 1893, when we illustrated his "Virgin and Child," in our own National Gallery. In the work of Memlinc, as Kuyler says, "the Flemish School of the 15th century attains its highest delicacy of artistic delineation; while in feeling, in purity, and grace he was more gifted than any painter subsequent to Hubert van Eyck." The portrait before us, of whose subject little is recorded by contemporary historians, is represented bust size in three-quarter face, her finely-modelled hands, clasped in the attitude of prayer, being just shown. She wears a dark cape over a dress. Her hair is brushed back behind a lofty headdress of linen, with a gauzy veil of almost transparent texture crossing her face. The interwoven links of her gold necklace support a locket, with two large amethyst jewels hung below. The features are regular, the forehead lofty, and the lips well shapen. She stands before a window, with a glimpse of distant landscape seen between the bases of Ionic columns. The lighting is brilliant and clear, and the treatment of the half-tones of flesh in face and hands more successful than that of the draperies. Memlinc's dated pictures range from 1467 to 1491.

TRUT HALL, NEAR HELSTON.

We give a bird's-eye view and plan showing the restorations and additions recently made to this residence in South-West Cornwall, under the direction and from the plans of Mr. James Hicks, M.S.A., of Redruth.

PROPOSED COUNTRY CHURCH NEAR BRISTOL.

Mr. Edward Gabriel, of 42, Old Broad-street, E.C., the architect, has designed this church for a small parish not far from Bristol. It has a central tower, surmounted by a conical spire carried on a timber-framed belfry, which is reached by a stair turret between the south transept and the chancel apse. The materials are local stone and Bath dressings, the roofs being shown covered with tiles.

SKETCHES IN KENT.—(NATIONAL BRONZE MEDAL DRAWINGS.)

Among the earliest possessions of Christ Church Monastery at Canterbury may safely be classed the parish of Cliffe,* near Higham, and down to the days of the Dissolution it was retained by that foundation. The church, from whence we give some prize medal sketches to-day by Mr. Reginald J. Beale, is dedicated to St. Helen, and for the greater part is Perpendicular in style, with some Early English features. It still is enhanced by the miserere stalls found in most of the cathedral manors, and in the windows of the church may be seen some fragments of old glass. The Jacobean pulpit, with its quaint hour-glass, is, however, the most interesting object in the building. Upon the carving of the hour-glass bracket is inscribed the date of 1636. Mr. Beale has drawn out some of the sculptured panels to large scale. The remaining sketch gives a glimpse of the nave of Rochester Cathedral.

WOOD DETAILS OF SCREEN, MERCHANT TAYLORS' HALL.

In continuation of the series of illustrations of Merchant Taylors' Hall published by us last week, we give in our present issue a sheet of large-size details of the mouldings, &c., of the west screen. This forms part of the interior decoration of the great hall, which a year or two ago was executed from the designs of Mr. W. Hilton Nash, F.R.I.B.A., the architect to the Company.

STAIRCASE, BOSTON, MASS.

This illustration, printed on another page, shows a capital specimen of modern American decoration, of which the *motif* is a refined Renaissance of Italian character. It is just the sort of work with which our cousins across the water delight to enrich their great town residences, and the detail of the example here represented is of exceptional merit. It is shown to great advantage in the carefully and feelingly executed drawing by Mr. D. A. Gregg, who, we believe, is an Englishman now settled in the States, and we are indebted to the *American Architect* for the plate. Mr. William Y. Peters is the architect of the house, which is situated in Charlesgate East, Boston, Mass.

◆

A fire occurred in Providence Congregational chapel, Ovenden, on Friday, and damage to the extent of £1,500 resulted. The organ, which cost about £750, was completely destroyed. The chapel, which was opened in 1837, afforded accommodation for about 700 persons.

COMPETITIONS.

Durham.—The architects who submitted designs in open competition for the new council house and offices in Old Elvet, Durham, to be built by the Durham County Council, have banded themselves together to protest against the work being given to Sunderland architects instead of to the firm who gained the first prize in the competition. Messrs. Philip Tree and Ivor Price are acting as hon. secs. to the protesting competitors. They propose to visit Durham to-morrow (Saturday), and remain there till Thursday in next week.

Paris.—The first prize of 7,000f. in the competition for the rebuilding of the Cour des Comptes, which was burnt during the Commune in 1871, was awarded on Wednesday to M. Moyaux, a Government architect and curator of the ruins.

Philadelphia.—One hundred and eleven sets of designs for the new Art Building of Fairmount Park, Philadelphia, have been received by the Park Commissioners. The plan adopted for judging the designs is to refer them to a jury, consisting of the Provost of the University of Pennsylvania, one person to be selected by the directors of the Philadelphia Academy of Fine Arts, and three disinterested architects, with two experts who are not architects, to be chosen by the Memorial Hall committee. The jury will consider all the competing designs, and, on or before November 30 next, to report to the Commission, presenting eight of the designs, which they consider most worthy of the prizes offered.

West Ham Technical Institute.—At the last meeting of the town council of West Ham, the Libraries Committee recommended that Messrs. Gibson and Russell, the authors of the successful design for the technical institute (illustrated in our issues of October 4th and 11th), be appointed architects for the building, and that they be empowered to discuss with the architects some suggested internal rearrangements. Messrs. Gibson and Russell stated that the preparation of the drawings would take some six months, and the building nearly two years to erect and complete. The committee hoped the council would be in a position to open the institute in about two and a half years. The motion was unanimously adopted.

CHIPS.

The city council of Exeter have adopted the water committee's report recommending a scheme to improve the water supply at a cost of from £20,000 to £22,000.

Mr. Thomas Bottomley, surveyor, died at his residence, Rook-street, Bingley, on Tuesday week, after a long illness. The deceased leaves a widow and one son.

A special committee meeting of the District Council of Weston-super-Mare has been held for the purpose of further considering Messrs. Wolfe Barry and Brereton's report upon the proposed construction of a low-water pier, two marine lakes, and a pavilion. The committee having inspected the sites, it was proposed "That the pavilion be placed partly on Knightstone Island and partly on the sands in Glentworth Bay, extending from north-west to south-east." To this an amendment was moved that the pavilion be built adjoining the fountain; but the original proposition was carried by 12 votes to 5.

Mr. J. A. Langston, of 18, Took's-court, Cursitor-street, writes protesting against the assertion of a writer in the *Times* who asserts that that dwelling is the original "Bleak House" of Dickens, adding: "Snagsby's house is very old, and is likely soon to be demolished." Mr. Langston says the house and freehold belong to his wife, and goes on to say: "As one carrying on my profession of an architect at this address, I do not want those who know me to imagine I am living in a tumble-down old structure, whether it be Dickens's Snagsby's house or not."

The Archbishop of York on Saturday reopened the ancient church of St. Andrew, Normanby, near Kirbymoorside, restored under the supervision of Mr. Temple Moore, architect, of London. Included in the present restoration are the rebuilding of the north wall, restoring the north aisle, and opening out the fine 13th-century arcade. The chancel arch has been rebuilt, and a new three-light east window inserted, the work of Mr. Victor Milner, of London. Messrs. Barnes (of Malton) and Yearsley (of Pickering) were the contractors. The cost has been £1,300.

To the permanent collection of pictures at the Manchester City Art Gallery has been added a characteristic landscape by the late Vicat Cole, R.A., "The Heart of Surrey."

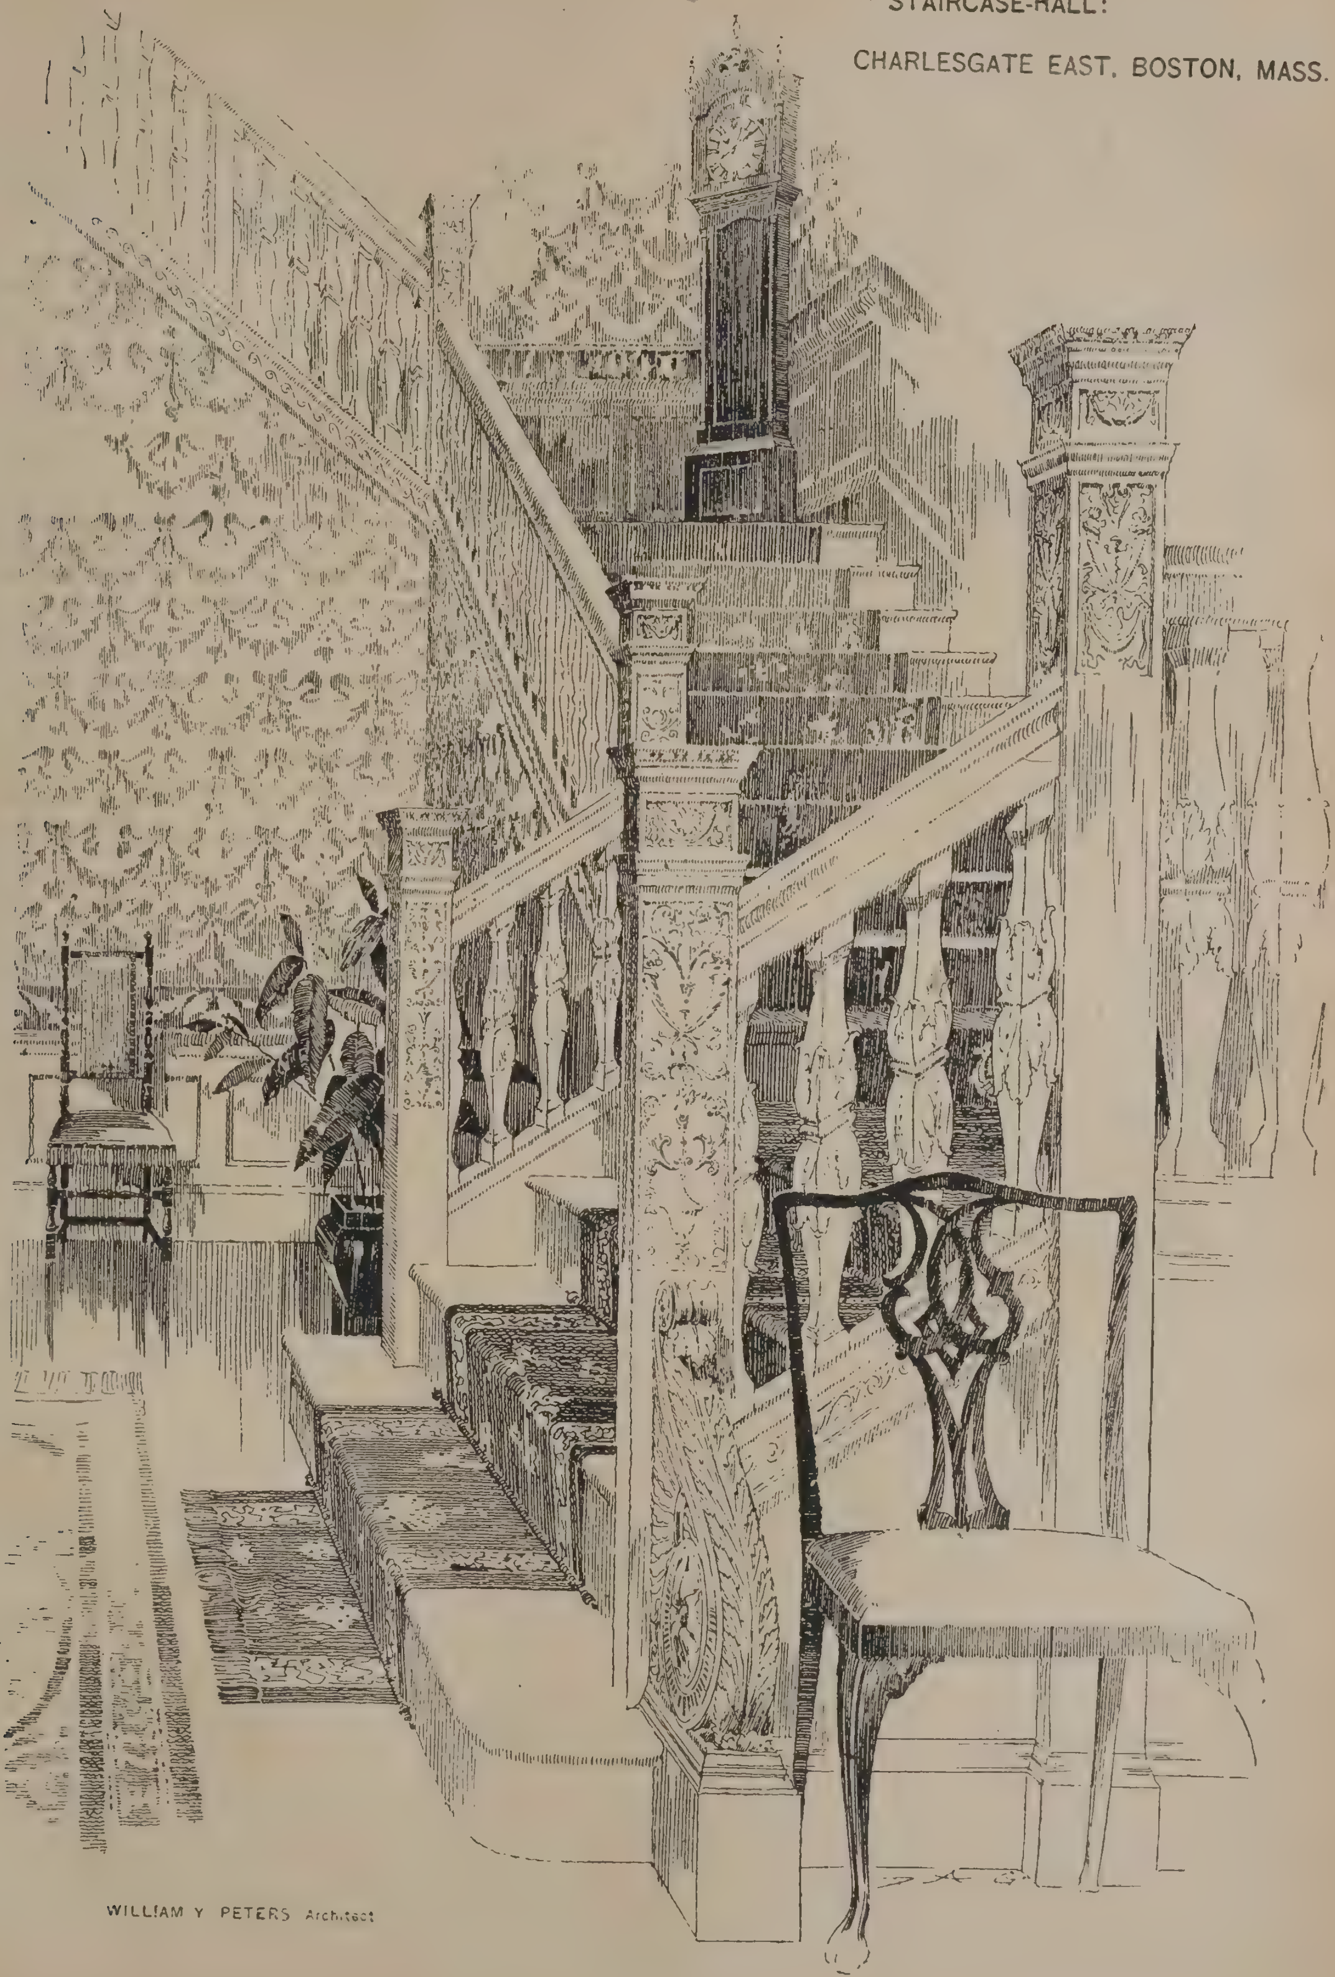
OLD·MASTERS·ON·THE·CONTINENT·N°26·

BARBARA VAN VLAENDERBERGH (BRUSSELS) BY HANS MEMLING (B. ? D. 1495) FLEMISH SCHOOL.

STAIRCASE-HALL:

CHARLESGATE EAST, BOSTON, MASS.



WILLIAM Y PETERS Architect

Building Intelligence.

Grimsby.—The Wintringham Higher Grade School, at Grimsby, which has just been built and furnished at a cost of £11,808, was formally opened on Friday. The school is situated in Eleanor-street, and is Flemish Renaissance in style. Accommodation is provided for a thousand pupils, and in addition to classrooms and lecture-theatre, there are a swimming-bath and gymnasium, a manual instruction-room for iron and brass-work, fitted up with lathes worked by power, and a chemical laboratory. A dining-room is also provided for pupils coming from a distance. For the girls, there is a large laundry and ironing-room, with drying-closets and other accessories. The work has been carried out from the designs and under the superintendence of Mr. H. C. Scaping, the board's architect. Messrs. Hewins and Goodhand, of Grimsby, were the contractors for the building. The furnishing has been in the hands of Messrs. Illingworth, Ingham, and Co., of Leeds; while Messrs. Reynolds and Branson, of Leeds, supplied the science apparatus. The heating apparatus is by Messrs. King and Co., of Hull.

Salford.—On Saturday the memorial-stones were laid of two new board schools—one in Blackfriars-street and one in Marlborough-road. The school in Blackfriars-street is being built from designs by Mr. Henry Lord, and replaces an older building. It will accommodate 666 children, 290 being infants and 376 older children. The school is being built by Messrs. W. Southern and Sons. The tender for the building amounted to £7,268, and the furnishing will cost about £450. The school is arranged transversely to the length of the site, which stretches from East Stanley-street to Wheathill-street, with its main frontage to Blackfriars-street. For the Marlborough-road school Messrs. Woodhouse and Willoughby are the architects. It is an addition to one built in 1880, and enlarged in 1883. The new building will accommodate 926 children—namely, 450 girls and 476 infants. Each department will have a central hall 60ft. by 30ft., and classrooms will be arranged on three sides of the hall. The building is being erected by Messrs. R. Neill and Sons. The accepted tender amounted to £7,777; the heating and ventilation will cost £450, and the furniture is estimated to cost £625—a total of £8,852.

Selkirk, N.B.—The foundation-stone of a group of new public halls was laid on Saturday on a site in Viewfield-gardens, facing the High-street. The buildings are designed in a phase of Renaissance style, and the principal features of the front elevation in the High-street are the central projecting porch with disengaged Ionic shafts and pilasters; a central compartment slightly projecting, surmounted by a pediment; windows with two and three-light openings, and an open balustrade finishing the façade above the cornice. The side elevations are treated in corresponding style. The building will contain behind a large central hall, capable of seating 1,000 persons, and designed for entertainments. It is fitted with a recessed gallery. It will have a ceiling of elliptical outline 30ft. high. The front building has upon the second floor a smaller hall accommodating 200 persons, and on the third floor a caretaker's house. On the ground floor there is a suite of retiring-rooms and other accessories. The building will be of red sandstone from Moat Quarry, Cumberland, faced with red stone from Hailes Quarry. The cost will be under £6,000. The architect is Mr. Hippolyte J. Blanc, A.R.S.A., Edinburgh, whose design was selected in competition.

◆

The Barry District Council will promote a Bill in Parliament next session applying for powers to secure additional lands on Cadoxton Moors for increased facilities with respect to the public water supply, and also to obtain possession of Cadoxton Common for public purposes.

On Friday, Col. Ducat, an inspector from the Local Government Board, held an inquiry at the Town Hall, Wolverhampton, relative to an application of the corporation for power to borrow £5,000 for extending the electric lighting station. The town clerk explained that the town council had obtained tenders for laying down additional plant and cables for supplying other public thoroughfares with electricity, and the cost was estimated at £5,000. The corporation could not take any more customers nor provide further street lighting without additional plant. There was no opposition.

Engineering Notes.

Budleigh Salterton.—The ceremony of the cutting of the first sod of the proposed railway from Budleigh Salterton to Tipton St. John on the Sidmouth Branch of the London and South-Western Railway will take place on Wednesday next, the 6th inst. The capital to carry out the undertaking is £60,000, with borrowing powers to the extent of £20,000. The new railway, which will be 6½ miles long, begins at one end with a junction of the Sidmouth Branch Railway at Tipton St. John, in the parish of Ottery St. Mary. It passes along the valley of the river Otter, keeping well above flood level. The first station from Tipton will be at Newton Poppleford, and the next at Otterton for the district of East Budleigh. The railway then leaves the valley and turns to the west towards Budleigh Salterton, through a country which will entail some heavy excavations, to the station at the higher part of Salterton, the locale being known as Broad Park. In the construction of the line there are no great engineering difficulties to be surmounted. At Newton Poppleford the line is to be carried over the road by an embankment and bridge, and the road leading from Otterton to East Budleigh will be crossed in a similar manner. The railway will cross the Budleigh Salterton and East Budleigh road on a steel girder bridge. The gradients will be easy until within a short distance of Budleigh Salterton, when there will be a rise of 1 in 50. At the Tipton St. John end plant is being deposited and other preliminary work advanced. The engineer is Mr. William Clarke, of Parliament-street, Westminster, and the contractors are Messrs. Lucas and Aird, who are locally represented by Mr. Grainger.

◆

The Eastbourne Town Council have decided to promote a Bill, in the next session of Parliament, authorising the council to provide an independent supply of water for the town. For some time the water supplied by the Eastbourne Water Company has been very hard and heavily charged with salt. The company will resist at every stage the proposed action of the corporation.

An evidence of the return of confidence in New South Wales is given by the acceptance of Mr. Amos's tender by the Illawarra Harbour and Land Corporation. The contract includes the formation of a line of railway, the construction of harbour works, and the dredging of a channel, and the contract is to be finished by November 20, 1897. The contract price is £200,000.

The Earl of Northbrook has given to the Diocesan Church House, Winchester, a carved oak bookcase, capable of holding over 1,000 volumes. It has been made from undoubted old timber from ancient houses and churches in Winchester. It will be a central ornament in the library at Wolvesey Palace, now reclaimed from semi-ruin, and made fit for the central work of the diocese, of which, at one time, Wolvesey was the local palace, ere its partial destruction in the 18th century. The firm of Messrs. Matthews and Sons supplied the case.

The Urban District Council of Handsworth have applied to the Local Government Board for sanction to the borrowing of £8,000 for defraying part of the cost of erecting a technical school on land already in their possession, and an inquiry has been held by one of the Board's inspectors into the application.

The Wandsworth Technical Institute was opened for classes on October 1. The skating-rink, known as St. George's Hall, in High-street, Wandsworth, has been subdivided by brick walls, surmounted by glazed partitions, so as to provide a chemical laboratory with balance-room, a lecture theatre, physical and mechanical laboratory, a workshop for the bricklayers' and masons' work, and a very large room which provides accommodation for the engineering shops and the carpenters', joiners', and pattern makers' shops. Other classrooms and a drawing-office have been provided in the front building. The alterations have been carried out by Messrs. Parsons, under the direction of Mr. E. W. Mountford, F.R.I.B.A.

All Saints' Church, Norfolk-square, W., which was destroyed by fire in the spring of 1893, has been rebuilt from designs by Mr. Ralph Nevill, F.S.A., and will be reopened to-day (Friday).

The *Parish Councils Gazette* for Oct. 26th gives as a frontispiece an excellent portrait of Mr. Silvanus Trevail, J.P., C.C., vice-president of the Society of Architects, in his official robes as Mayor of Truro.

The Isle of Man Tramways Company have decided to convert their existing horse-line along the Promenade at Douglas into a cable line.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

York Architectural Society.—The annual meeting of this society was held at the Church Institute, York, on Friday night. The president, Mr. H. Perkin, who occupied the chair, was re-elected to office for the ensuing year, and Mr. J. Lane and Mr. A. W. Turner were elected vice-presidents. The other officers were also re-elected, namely:—Hon. treasurer, Mr. N. R. Yeomans; librarian, Mr. W. E. Walker; secretary, Mr. A. B. Burleigh. The committee was reappointed as follows, Mr. J. Ferguson taking the place of Mr. A. P. Skeat:—Messrs. G. Benson, A. H. Claypoole, J. T. Pegge, and A. Hirst. The society's prize of three guineas for the best design for a "Village Club-house," on an isolated site—cost of the building not to exceed £1,000 at 6d. per foot cube—was awarded to Mr. J. J. Kempley, pupil of Mr. W. G. Penty.

CHIPS.

The new additions to the infectious hospital, Northampton, have been warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves, with descending smoke-flues, and patent Manchester grates, those previously supplied having proved very satisfactory.

Works of water supply, carried out for the Pickering Rural District Council at Levisham, were inaugurated last week.

A stained-glass window containing female figures which represent the cardinal virtues of Faith, Hope, and Charity has been placed in Cowick Church, Snaith, by Mr. B. Shaw, of Ferriby, to the memory of members of his family. The work has been designed and executed by Messrs. Powell Brothers, of Park-square, Leeds.

In an action for libel tried on Monday and Tuesday before Mr. Justice Wright and a common jury, Mr. John Cropley, a clerk of works, now employed on the block of buildings in course of erection in St. Paul's-churchyard, living at Walthamstow, recovered £50 damages from the editor and proprietors of a Walthamstow newspaper, in which, for political purposes, charges had been made reflecting on the character of plaintiff, who was a member of the district council.

At Tuesday's meeting of the London County Council, the General Purposes Committee was instructed to report upon the use of hoardings round the Council's works for advertising purposes. A proposal by Mr. L. Holland, M.P., to invite tenders for work only from firms having their works in the County of London was negatived by 68 against 26.

The first day's sale of the Liberator properties at Coventry Park, Streatham, took place on Tuesday, in the Great Hall at Winchester House, Old Broad-street, by Mr. Douglas Young, all being sold with the exception of three houses. The total sum realised was £28,070. There was a very large attendance of buyers, and the competition was keen.

Lord Dufferin, as Lord Warden of the Cinque Ports, has consented to sit for his portrait to an eminent artist. The picture will be placed in the ancient Maison Dieu Hall, at Dover, which contains portraits of Pitt, Wellington, and other distinguished Lord Wardens of the Cinque Ports.

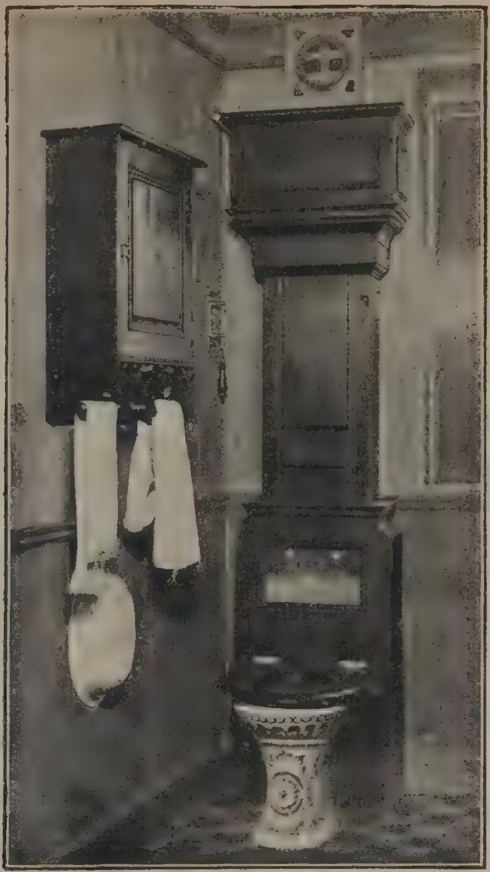
The Special Board for Classics at Cambridge University, with a view to encouraging archæological research in Hellenic lands, recommend that an annual grant of £100 for three years be made from the Worth Fund to the managing committee of the British School at Athens.

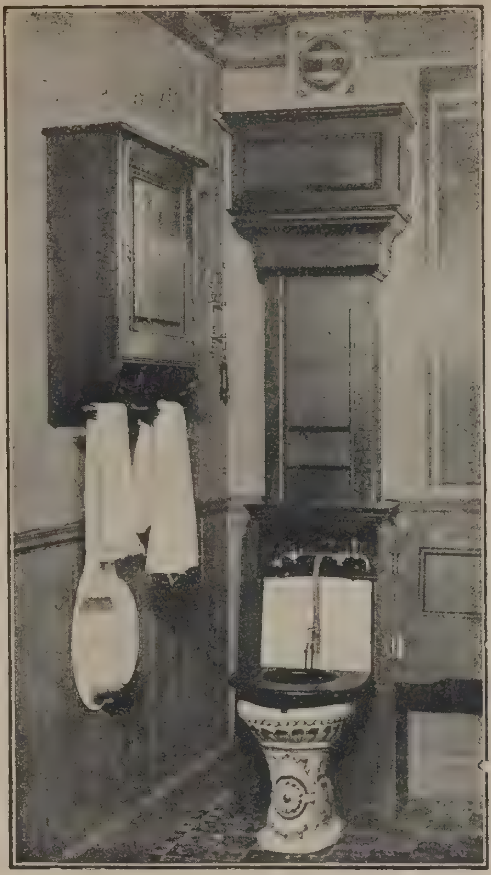
The new asylum now in course of erection at Newport, Isle of Wight, will be ventilated on the Boyle system, the latest form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

Aber-y-Nant, Llanidloes, lately bought by Dr. Morris, is being enlarged and renovated, having consulting and waiting-room, bedrooms, and surgeries added to the west wing. The builder is Mr. J. J. Meredith, Llanidloes, and the architect is Mr. T. G. Williams, M.S.A., 3, Cable-street, Liverpool.

The urban distant council of Barry, Glam., have adopted plans by Mr. J. C. Pardoe, their surveyor, for proposed permanent abattoirs and lairage, estimated to cost £6,000, to be built on a site between Court-road and Barry-road, Cadoxton.

The premises formerly known as the Knapp Inn and some adjacent cottages at Bradpole, Dorset, have been pulled down and replaced by a large residence. Mr. C. V. Johnson was the architect, Messrs. Thomas Stone and R. B. Williams were the builders, and the oak mantelpiece was carved by Messrs. Harry Hems and Sons, of Exeter. A dinner was given to the workmen engaged on the works one evening last week.





THE "SCIENTIA" WATER-CLOSET APPARATUS.

WE give two illustrations of a new w.c. apparatus which has been conceived by a well-known North of England architect of much experience in sanitary matters. The outstanding feature of the closet is that it combines within narrow limits several important purposes not hitherto connected with a w.c., and these additions assist in making the ventilation of the closet absolutely perfect. By the addition of a tap-chamber with hot and cold connections, the apparatus provides an excellent housemaid's draw-water and sink, while, at the same time, the existence of the hot-water pipe in the shaft of the apparatus creates a gentle and constant current, which at once removes all odours from the point where they are generated to outside the walls of the building. Advantage of these taps has been taken to introduce a most convenient form of fountain bath or hip bath. One of our illustrations shows this connection; the taps being under complete control, the temperature may be varied at the wish of the user, while the water is at once run off through the medium of the w.c. basin on which the bath sits. An enamelled iron basin is also provided for the same seat; this may be used as a wash-hand basin or as a bidet. Those who have the misfortune to suffer from certain complaints cannot fail to at once perceive the advantage of these two important additions at the particular point where they are so valuable, and many will consider that this handy little bath has some advantages over the cumbrous and costly sitz bath. Two cisterns are provided, one for the closet and another for the urinal, which is also an important feature. The urinal, besides having the benefit of the continuous ventilating current, is automatically flushed at each time of using. Were this arrangement adopted in even our most recently-constructed public urinals, a great and unnecessary waste of water would be avoided. A jet of gas is introduced into the tap chamber. This is sufficient to light the apartment, and in the few cases where the hot water may not be connected, the heat of the gas will create the ventilating current.

Owing to its independent system of lighting and ventilation, the "Scientia" is peculiarly suited for positions where the ordinary w.c. would be absolutely dangerous, and by its adoption in such cases much expense in structural alterations in our commercial and other buildings may be avoided. The "Scientia" in a most important point differs from all other closets—viz., that *by no chance* can any smell enter the house, as every particle of air within the closet basin is by the ventilating current drawn outside.

Our illustrations are from photographs of a closet fitted up at the works of the Burgh Cabinet Works Co., Easter-road, Edinburgh. This firm have made water-closet fittings a particular branch of their business, and along with the author, through various experiments, have now arrived at a definite and workable apparatus scientifically perfect.

In order to test the apparatus in the most crucial manner, it was determined to make the window to the w.c. chamber *a fixture*, so that it *could not be opened* under any pretext. Such an arrangement, we need hardly point out, would have been simply intolerable with an ordinary w.c.; but with this new form of ventilating w.c. it is found, after several months of constant daily use by a number of persons, that there is not the slightest trace of smell from the closet, though no air reaches it except through the doorway.

Where economy of space is a matter of moment, its compactness ought to commend it, as it embraces the following features in one apparatus:—1st, A water-closet; 2, an automatic suction ventilator; 3rd, a concealed urinal of the regulation height for adults; 4th, a lavatory with hot and cold supply; 5th, a housemaid's "draw-water," with hot and cold taps; 6th, a capacious slop sink where the hot and cold water provides for the proper cleansing of all vessels; 7th, a fountain bath or rising douch, in which the temperature of the water may be regulated at the will of the user.

THE APPRENTICE SYSTEM.

THE report on apprenticeship in the London building trades, which is the result of the recent trade conferences inaugurated by the Technical Education Board, gives many interesting particulars relating to the apprenticeship system in the London building trades. The Board secured the services of Mr. Oldman, the secretary of the National Association for the Promotion of Technical and Secondary Education, and his report has been published. It summarises the opinions of the employers of labour and the trade organisations on the question. We shall not attempt here to give a *résumé* of the whole report, but confine our attention to a few of the leading points of general interest. Out of ninety firms addressed, less than half replied, and these include general builders, a few joiners and masons, plasterers, plumbers, and smiths, and one painter and decorator. It appears that out of a total of 12,000 men, including labourers, in the building trades of London, a very small fraction—only 80—have been found to be apprentices. "Four firms," it is stated, "with a total staff of about 1,000 had not a single apprentice. It may be asked where the bulk of the young men come from, and how they are taught? The report attributes the dearth of apprentices to the engrossing nature of London businesses on their commercial side, to the extensive use of machinery, to the necessity of utilising all available space, and to the reluctance of employers to undertake moral responsibilities which they feel unable to discharge. The difficulty of keeping under disciplinary control youths who may disorganise the whole shop, or who become dissatisfied with the scale of wages, and endeavour to obtain the full pay elsewhere, is the main cause. In such instances the employer has no remedy except a legal one against such incorrigible lads; his business suffers. Those boys bound through the various organisations or City companies and boards of guardians give the least annoyance, and it is suggested that it would be well if all apprentices were subject to the control of a board acting as an intermediary between employers and parents. Learners have, it appears, equal advantages with apprentices, and employers in some cases prefer them, as they can be dismissed for misconduct. Both classes receive the same rate of payment, with annual additions. Referring to the views of employers as to granting time for apprentices and learners to attend technical classes, some firms make concessions for this purpose, one paying class fees and granting an afternoon weekly, others give permission to leave one hour earlier, but, as a rule, the full time is worked, though there are firms who encourage their employés to take advantage of these evening classes. On the whole, it is stated there exists a deep-rooted belief in apprenticeship as being the best means by which a boy can learn his trade. The employers generally urge that "classes should be restricted to persons actually engaged in the trade," and "that great care should be exercised to secure as instructors those who adopt such methods of teaching as will not fail to supplement the workshop training."

In referring to the trades, there is a strong feeling among workmen against "overlapping." Thus roof tiling is now often done by slaters and the bricklayers and tilers object to this.

Again, it is mentioned that the title of "carpenter and joiner" has lost its old meaning. Under the new system the carpenter is only regarded as being capable of doing the rougher kinds of work—such as flooring, joisting, roofing, centres, &c. On the contrary, the joiner is a more skilled workman, but is threatened by machinery, and machine-made joinery has a tendency to "transform the joiner into a wood fitter." As to masons, also, it is asserted that thoroughly skilled masons are not so often met with as formerly, and those capable of erecting a winding stone staircase are very scarce. In the trades of painters and decorators, plasterers, plumbers, a similar general deterioration or change appears to have taken place; very few painters understand the technical details of their trade. Masonry proper is not taught, and the classes that are formed—as those of the Science and Art Department and the City and Guilds of London Institute—are devoted chiefly to geometry and building construction, and the masonry classes are said to be monopolised by bricklayers, and taught by them. As to plumbers, while many value the certificate of the Plumbers' Company, others attach very little importance to it, and say that "there are many competent men who would be unable to pass the test," and that the certificate is no guarantee for good workmanship. The general opinion as to technical schools and classes is that they do not form a satisfactory substitute for apprenticeship, that there is no reality about the class. A distinction is drawn between a "decorative artist" and a "decorator." The former should be a competent draughtsman, having a knowledge of the human form and of design, conventional and natural ornament, the application of ornament and colour; and the latter should be able to execute any design made by the decorative artist. Few men are capable of making decorative artists, one in 100 probably, although the other 99 may make good decorators. The object of the technical school should be to teach how to become good decorators, in which case workshop practice and freehand and geometrical drawing should be taught. Into the suggestions offered by employers we cannot now enter; but we have endeavoured to show the general drift of the opinions entertained, and which have been summarised in the report to which we refer.

NOTES FROM PARIS.

THE question of supplying Paris with amply sufficient water for domestic and industrial purposes is recognised as being one of the greatest importance, and after the many inconveniences which Parisians have been obliged to submit to during the recent exceptionally dry weather, it is urgently desired that some decision be speedily come to regarding this all-important question.

When Belgrand, 30 years ago, proposed a scheme of supplying Paris with seventy million gallons of water per day, the town and suburbs counted a little over a million and a half inhabitants only; to-day the population is more than doubled. The annual increase of inhabitants in the town and suburbs averaging fifty or sixty thousand, at the commencement of the 20th century the total population will be at least four millions, or one-tenth of the population of France. The daily supply of water should, therefore, average 186 million gallons in order to realise the calculations of Belgrand, and at least an equal quantity for public uses, cleansing of the streets and drains. The actual deficit for private and public purposes is over 200 million gallons, and it seems scarcely possible to reduce this deficit in any reasonable proportion by supplies of water from the district surrounding Paris, for the supply derived from the basin of the Seine is constantly diminishing, the quantity not reaching above 44 million gallons in summer time, the extra supply from the Seine, the Marne, and the Ourcq being unwholesome, besides being considerably diminished in late years by reason of the numerous extra supplies drawn off for the use of the manufactories above Paris. It is, therefore, necessary to devise a scheme for supplying the town with a considerable quantity of water derived from sources at some distance from Paris, since the greatest supply which could be obtained from the neighbourhood would be far from sufficient. The scheme originated by MM. Badois and Duvillard, civil engineers, for obtaining an ample supply of water for all purposes from the French waters of Lake Leman, on the Swiss frontier, is greatly in favour, and although the work of canalisation would be difficult, long, and costly, yet it is probable that this scheme will be shortly adopted, as being the only one likely to afford an ample supply of water necessary to the town and environs of Paris. M. Badois was chief engineer of the working section of the Suez Canal, and M. Duvillard chief engineer of the Creusot works, so it is considered that the scheme and its execution is in very good hands. Lake Leman is at an altitude of 1,200ft. above the sea level, and would, therefore, permit the gradient of 2ft. 8in. per mile, allowing the water to arrive at Paris at an elevation sufficient to allow the proper supply of the town and environs. The scheme estimates the supply at 5,280gal. per second as an average, and 6,600gal. per second as a maximum in summer time, or from 440 million to 550 million gallons per day taken from the French side of the lake at about 1,300ft. distance from the shore, and at a depth of 130ft., at a point where the water is free from all impurities of the shore or surface, and remains at an almost constant temperature of 8° Centigrade. Lake Leman, supplied in greater part by the melting snow from the Alpine glaciers, has a superficies of about 148,000 acres, and a depth of over 1,000ft., containing, therefore, over 20 million of million gallons. The greater part of this water is derived from a French watershed of a length of about 32 miles, the supply feeding the lake varying from 22,000gal. per second in winter to 330,000gal. per second in summer, the supply, of course, being much greater in summer, owing to the melting of the snow on the watershed. The frontier line between France and Switzerland crosses the lake at about its middle longitudinally. Each country has, therefore, the property of the water from the surface to the bottom on its own side of the frontier line. France has, therefore, the right of using the water of her own property, on condition not to prejudice the owners of property on the shores of the lake. It is expected that no difficulties will arise regarding this question, and proper arrangements will be made to avoid injuring the hydraulic mills and power stations established on the shore of the lake at Geneva. As regards the navigation of the river Rhone, the scheme should in no wise prejudice this, for the level of this river is lowest during winter, and at this time the navigation is almost suspended, owing to the ice. In the summer the increase of water from the Alps is so great as to fully compensate for that taken from the lake for the supply of Paris. The aqueduct will be on French soil from its outset, its point of departure being near Thonon (Haute Savoie), the distance as far as Paris being as near as possible 330 miles, passing near Mâcon, Lyons, Nevers, Fontainebleau, Sceaux, and Versailles. The town of Lyons, at present very insufficiently supplied with water, being at only 13 miles from the proposed route of the aqueduct, will be able to take advantage of the supply, which would reach the town at an altitude of 300ft. above the sea quays. The canals along the route will also be fed with extra supplies, most acceptable during the dry season. Near Paris a reservoir to contain about 180 million gallons would be constructed at an altitude sufficient to afford the proper supply of Paris and neighbourhood.

The cost of the scheme is estimated at sixteen millions sterling, with an addition of four millions for interest on capital during the construction and for contingencies, another two millions being added to avoid all surprises which might occur. The necessary credit will, therefore, be twenty-two millions sterling, the estimated sale of water providing a revenue of 8 per cent. on the capital. If, however, the scheme is financed by the town of Paris itself, the economy to be realised would be great, and a larger profit made. The water of the Lake Leman at a certain depth has been found by analysis to be of great purity, and eminently suitable for drinking purposes. Five or six years would be necessary for the construction of the work. If, therefore, the scheme is at once voted, it is hoped that for the great fête of 1900 Paris will have a supply of water ample for its own uses and those of the many visitors expected during that eventful year.

The "Savoyarde," the immense bell destined for the Church of the Sacré Cœur, has just arrived at Paris, and has with some difficulty been hauled up the steep slope of Montmartre, and placed under a temporary campanile. The conveyance from the foundry of Annecy-le-Vieux (Haute Savoie) as far as Paris was not a simple matter, for the Savoyarde is 13ft. high, with a diameter of 10ft., the thickness at its base being 9in. It weighs 27 tons, the tongue alone weighing nearly 17cwt. Its cost was £2,600, the funds having been collected entirely in Savoie. The dedication is to St. François de Sales. On the outside of the bell are graven the names of the principal donors, the coat-of-arms of the town of Paris, and portraits of a number of saints. The ornamentation is in the Empire style. The metal of this bell is formed of an alloy of 78 parts copper to 22 of tin. It appears that the casting was very successful, and that the tone of the bell is exceedingly pure. The sound vibrations last seven minutes, and may be heard at 25 miles distance. The Savoyarde is the largest bell in France.

The Académie des Beaux-Arts has just elected M. Nenot, architect of the new Sorbonne, to a chair in the Section of Architecture, left vacant by the death of M. Ancelet. The honour was warmly disputed by four candidates, well known as distinguished architects, MM. Nenot, Guadet, Sédille, and Dutert. Despite the first series of votes in favour of M. Guadet, the final result was carried off by M. Nenot by a majority of three votes. The new member of the Academy is young for the distinguished position which has been conferred upon him, being only 42 years of age. Entering the Ecole des Beaux-Arts at the age of 17, his studies and talent enabled him to carry off the Prix de Rome in 1877. In 1882 M. Nenot obtained the first prize in the competition opened by the Italian Government for a monument to Victor Emanuel; but the monument remained unexecuted owing, it is said, to the jealousy of the Italian Government against a Frenchman carrying off the first prize. But several months later this young architect, at the age of 29, obtained the first prize in the competition for the reconstruction of the Sorbonne, and was intrusted with the work of executing what is now one of the finest monuments at Paris. Unfortunately a thoughtless youthful exploit at the commencement of his career was nearly the cause of spoiling his future, and was for a long time the source of much trouble to the rising architect. Returning from a hunting party, he thoughtlessly discharged his gun at an old cross on the border of the wood; an eye-witness accusing him of sacrilege was the cause of a condemnation to two months' imprisonment, his discharge from the army, and the loss of his military medal which he had won by exceptional deeds during the siege of Paris. This condemnation gave rise to much noise, and the Government, admitting it to be excessive, at length reduced the punishment to a simple fine; but the fact of the condemnation weighed heavy, and was for a long time the source of much disagreeableness and difficulty with the various administrations of fine arts. The young architect's courage and talent, however, at length won him great favour, and the Government decided to decorate him; but the condemnation of the Tribunal of Chartres remained an obstacle to this honour, the military rehabilitation not having been made. However, in 1885 a special order was made for rehabilitation, and M. Nenot was decorated with the Legion d'Honneur.

The Gobelins Manufactory has just completed the third of the large tapestry panels representing Literature, Science, and Art in antiquity, middle ages, modern times, destined for the decoration of the ante-chamber of the National Library in the Rue Richelieu. The twelve panels of the "mois grotesque," after the drawings of Ehmann, are also nearing completion. These panels are destined for the Sorbonne, and will figure at the coming Salons.

An interesting find has been made in the Cathedral of Angers—the discovery of the tomb of King René and his wife, Isabelle of Lorraine. The vault was found during some repairs being made to the pavement of the nave. The leaden coffins contain the bones of the once august couple, and through an opening in one of them may be seen the crown and sceptre on either side of the body.

The town of Paris has just inaugurated a bathing establishment for the use of communal school children, the supply of water for which is obtained from a rather novel source. The warm water is furnished from an artesian well 2,350ft. deep, supplying 2,500 gallons per hour at a temperature varying between 27° and 30° Centigrade. The baths are about 500ft. long by 130ft. broad, including 250 cabins, drying and douche rooms.

The work of installing the system of drainage *tout à l'egout* at Marseilles is being rapidly pushed forward; but it is feared that when ready the water supply of the town will not be sufficient to afford the water necessary for the proper flushing of the drains and sewers. A scheme of further water supply is being urgently considered, and it is to be hoped that the work will be speedily executed, for the apparent want of forethought concerning sufficient water supply for flushing purposes when arranging the *tout à l'egout* system has done much harm to the cause of this method of sanitation. The lack of sufficient water for the necessary cleansing of the small proportion of drainage already executed at Paris has turned many against this system, owing to the evident inconveniences, which would not have declared themselves if the supply of water for the sewers had at the outset been sufficient.

The Exposition of Work continues to be a success as regards the daily concerts. A new and somewhat tardy addition to the building section of exhibits is being arranged in the upper galleries. This may possibly prove more interesting than the existing portion. A rather novel idea in the new section is the exhibition by a well-known architect of the work done by an architect for the construction of a large dwelling-house, consisting of a large wall-surface covered with the preliminary sketches, small and large scale drawings, details, working drawings, &c., actually done for the work of building an existing immeuble. The public will, therefore, possibly for the first time, have an opportunity of realising the large amount of work done by an architect in the construction of an ordinary dwelling-house.

English admirers of the celebrated and regretted Viollet-le-Duc will be pleased to learn that a very fine edition of the unpublished drawings of the master is being prepared under the patronage of the Administration of Beaux Arts. Those who have seen exhibited at the Trocadero Museum the numerous sketches and drawings of this fervent admirer of the architecture of the Middle Ages have, without doubt, longed for a collection of copies of the most original and interesting. Thanks to the zeal of the well-known architect, M. de Baudot, and M. Roussel (secretary of the Trocadero Museum), a series of perfect reproductions have been made of some of the most interesting of the drawings found in the portfolios left by Viollet-le-Duc. The greater portion of these reproductions consists of measured sketches, compositions destined for the restoration of Notre Dame, of the Château de Pierrefonds, the Cathedral of Clermont, and the Church of Saint Denis. M. de Baudot joins a biographical notice on the life and work of the late celebrated architect.

An interesting, because novel, competition is opened by the well-known daily paper, the *Figaro*, for a new building contiguous to the existing offices with their original façade on the Rue Drouot. The requirements of the proposed building consist of the usual printing offices, administration offices, libraries, and all the dependencies necessary to the business establishment of an important paper. The chief feature of the ground-floor plan is, however, to be the Salle de Dépêches—a now greatly necessary and much appreciated addition to the public portion of the offices of every Paris daily of any importance. This public hall for the exhibition of current news, telegrams, illustrated papers from all countries, actualities, photographs of public men, and the exhibition or sale of interesting novelties, is daily becoming of more and more importance. A dozen designs by well-known Parisian architects have been sent in for this competition, and in each of them the public hall has evidently received special attention, arranged as a well-lighted, spacious, and elegantly-decorated lounging salon, easily and largely communicating with the street, and offering a bright invitation to the passer-by who has a little time to spare, and who wishes to learn the current news, or look at the illustrated journals. The premiums for this competition are £200, £120, and £80, for first, second, and third respectively.

The committee of the Exposition of 1900 is at present arranging the programme of the competition for the two important palaces to be built in the Champs Elysées, on the site of the shortly to be demolished Palais de l'Industrie. The presidents of the Society of French Artists, the National Society of Fine Arts, and the Society of Architects are invited to take part in the meetings of this committee. The programme will be made public as soon as it has received the sanction of the Paris Municipal Council.

A sum of £400 is being voted for the purpose of verifying the assertions of the authors of the various schemes now proposed for the purpose of supplying Paris with an ample quantity of water for domestic purposes. Amongst these schemes is one proposed by Baron Tyndal—a Dutch *savant*—which is extremely interesting as regards the method of purifying water of a doubtful character, such as the Seine water, which the inventor proposes to sterilise and make fit for drinking purposes. The system, briefly, consists in sterilising the most contaminated water by means of a powerful current of electrified air—in other words, pure ozone. The polluted water from the Seine, on which conclusive experiments have been tried, becomes, after the passage of the ozone electrified by a current of from 10,000 to 30,000 volts, of a perfect purity, and, according to the assertions of Doctors Nocard and Roux, perfectly free from any trace of microbes or impurities, and in every way fit for drinking purposes. It will be the duty of the examining committee to find out whether this system may be applied with an equal effect to very large quantities of water. At present the experiments, made in the galleries of the Champ de Mars, have been confined to reservoirs containing about 500 gallons only.

Paris, Oct. 19. ARTHUR VYE PARMINTER.

CHIPS.

The Great Western Railway Company are inviting tenders for the construction of a branch railway in South Devon, from Yealmpton to Plymstock.

A golfers' hotel is about to be built at Luccombe, near Bonchurch, Isle of Wight. The building, which will cost about £17,000, including the suite of Turkish baths, will occupy a site of 40 acres, which has been laid as an 18in. hole golf-link.

At a meeting, on Friday, of the Records Committee of the Cardiff Town Council, reports were received as to the progress of the work of Mr. J. Hobson Matthews as borough archivist. It was considered desirable that Mr. Matthews should bring the collection of materials to a close with the end of the present month in view of an authorisation from the council for the preparation of a full report.

The Marquis of Londonderry on Saturday presented to Colonel J. W. Cameron, of West Hartlepool, a portrait of himself, painted by Mr. A. S. Cope. Colonel Cameron has asked the town council to accept the portrait, and to hang it in the council chamber.

At the annual meeting of Greenock Dean of Guild Court, Dean Watson reported that the value of new buildings, additions, and alterations to buildings in town amounted in value to £21,285, as against £33,792 in 1894, and £54,170 in 1893. Amongst the buildings at present in course of erection in town were three churches.

The interesting parish church of Ewerby, near Sleaford, has just been restored at the expense of the Earl and Countess of Winchilsea. Among the interior enrichments are a new oak reredos, brass eagle lectern, full set of altar frontals and hangings, with dossal and brass lamp standards for the sanctuary. All the above fittings have been obtained from Messrs. Jones and Willis, of London and Birmingham.

An extensive addition, costing upwards of £7,000, is being made to the Devon and Exeter Hospital, from the designs and under the superintendence of Mr. Cole, of Exeter. The contract has been let to Messrs. Tree and Bolley. The floors are to be fireproof, on the Mark Fawcett system.

On October 2 the new buildings of the Putney School of Art were opened by Sir Arthur Arnold. This school was established about eleven years ago, and, until the present month, has been accommodated in two rooms above the parish offices. The treasurer of the school, Mr. W. J. Lancaster, has purchased a new site, having erected the school now opened wholly at his own expense, and has leased the premises to the committee at a very low rent. The school comprises on the ground floor an elementary room, measuring 48ft. by 36ft., which can be divided by curtains into three rooms, a modelling room, a room for the headmaster, a needlework room, porter's room, cloak-rooms, &c.; on the first floor an antique-room and life-room, divided by a sliding partition, and a wood-carving room. In the basement are caretaker's premises and the heating-chamber. The school has been erected by Messrs. Holloway Bros. to designs prepared by Mr. Thos. W. Willis.

Park-street Congregational Chapel, Hatfield, was reopened last week after renovation and improvements, carried out by Mr. F. Dunham, of Hatfield.

Good progress is being made with the erection of the exhibition buildings at Cardiff, the electric light being employed so that the work can be pushed forward at night.

TO CORRESPONDENTS.

[We do not hold ourselves responsible for the opinions of our correspondents. All communications should be drawn up as briefly as possible, as there are many claimants upon the space allotted to correspondents.]

It is particularly requested that all drawings and all communications respecting illustrations or literary matter should be addressed to the EDITOR of the BUILDING NEWS, 332, Strand, W.C., and not to members of the staff by name. Delay is not unfrequently otherwise caused. All drawings and other communications are sent at contributors' risks, and the Editor will not undertake to pay for, or be liable for, unsought contributions.

Cheques and Post-office Orders to be made payable to THE STRAND NEWSPAPER COMPANY, LIMITED.

TERMS OF SUBSCRIPTION.

One Pound per annum (post free) to any part of the United Kingdom; for Canada, Nova Scotia, and the United States, £1 6s. 0d. (or 6dols. 30c. gold). To France or Belgium, £1 6s. 0d. (or 33fr. 30c.) To India, £1 6s. 0d. To any of the Australian Colonies or New Zealand, to the Cape, the West Indies, or Natal, £1 6s. 0d.

ADVERTISEMENT CHARGES.

The charge for Competition and Contract Advertisements, Public Companies, and all official advertisements is 1s. per line of Eight words, the first line counting as two, the minimum charge being 5s. for four lines.

The charge for Auctions, Land Sales, and Miscellaneous and Trade Advertisements (except Situation advertisements) is 6d. per line of eight words (the first line counting as two), the minimum charge being 4s. 6d. for 40 words. Special terms for series of more than six insertions can be ascertained on application to the Publisher.

Front-page Advertisements 2s. per line, and Paragraph Advertisements 1s. per line. No Front-page or Paragraph Advertisement inserted for less than 5s.

Advertisements for the current week must reach the office not later than 3 p.m. on Thursday. Front-page Advertisements and alterations in serial advertisements must reach the office by Tuesday morning to secure insertion.

SITUATIONS.

The charge for advertisements for "Situations Vacant" or "Situations Wanted" is ONE SHILLING FOR TWENTY-FOUR WORDS, and Sixpence for every eight words after. *All Situation Advertisements must be prepaid.*

NOTICE.

Bound volumes should be ordered early (price Twelve Shillings each), as only a limited number are done up. A few bound volumes of Vols. XL., XLI., XLVI., XLIX., LI., LIII., LIV., LVIII., LIX., LX., LXI., LXII., LXIII., LXIV., and LXV. may still be had, price Twelve Shillings; all the other bound volumes are out of print. Most of the back numbers of former volumes are, however, to be had singly. Subscribers requiring any back numbers to complete volume just ended should order at once, as many of them soon run out of print.

RECEIVED.—J. E. Alloway.—Land Surveyor.—E. W. S.—C. R. and Co.—F. G.—L. G. F. (Staines).

A PRINCELY PREMIUM.

To the Editor of the BUILDING NEWS.

SIR,—At a recent meeting of the Northallerton Urban District Council a resolution was carried that invitations be sent to three or four competent engineers asking them to formulate a sewerage scheme suitable for that district, and that the council should offer a premium of £15 for the scheme which they decided to accept. Surely the district council made a serious mistake when they resolved to offer the magnificent sum of £15 as a premium, and Mr. Baines forgot himself when he indulged in such an outburst of generosity towards three or four "competent" engineers when he moved that they should be asked to formulate schemes of sewerage for an important place like Northallerton, and that the successful engineer should be paid the sum of £15, which is about equal to a penny per head of the population, and about one-third of a penny in the pound on the general district rate of the district. What a fortunate man the engineer will be who succeeds in winning the premium! He will be rich beyond the dreams of avarice, and when his fellow townsmen learn of his sudden acquisition of wealth they will denominate him the local Rothschild, and make such calls upon the sum standing to his credit at the bank—great in consequence of the splendid shilling (£15)—as would in time ruin a Crœsus, to say the least of it. Think of the orphans he could endow; the school children he could entertain; the schools he could found; the aged poor for whom he could build almshouses; the reduced gentlefolk he could provide with annuities; the friends to whom he could give regular supplies of creature comforts, and last, but not least, he could now afford to give the council the £15 for the establishment of a Dutch parliament, and secure to them in perpetuity a plentiful supply of pipes, and cakes, and ale. A "competent" engineer has become so, solely in consequence of his lack of experience and learning and the expenditure of time and money; and one in four can well afford to work for nothing and find himself and pay assistants, and keep an office open and bear all the local burdens, and make a present of his surveys and estimates to any local authority generous enough to accept them free of cost. The labourer is not worthy of his hire, and the ox which treadeth out the corn shall be muzzled. Any "competent" engineer who is large-hearted enough and has the temerity to comply with an invitation of the Northallerton Council, which expects something for nothing, is not worth his salt, and ought to (as he would no doubt) earn the contempt of the engineering profession. I have yet to learn that a man's services are to be rewarded according to the measure of the poverty of the local authority requiring his services. If I thought that such bounty as that proffered by the Northallerton Urban District Council were to be my reward, I would ask my father to cancel my articles with the "competent" engineer under whom I am serving, and either to hire me out as a crossing-sweeper or put me as an apprentice to a hawker of sand and rubbing stones, so that I might have the hope of some day securing a competency, and of eventually retiring to a suburban villa and becoming a famous district councillor moved only by one feeling—that of saving the rates and paying every man according to his worth—his worth being assessed by me.—I am, &c.,

October 23. Apprentice C E.

◆

CHIPS.

In the list of adjudications in bankruptcy published in Tuesday's *London Gazette* the name appears of Roby Edward Carpenter, of Burton-on-Trent, architect and surveyor.

Upon the occasion of the reopening of Morton Church, Bingley, on Saturday last by the Bishop of Ripon, a stained-glass window, which has been presented to the church by way of memorial to the Garritt family, was unveiled. The work is from the studio of Messrs. Powell Brothers, of Park-square, Leeds.

In the case of Alfred Carden, of Brighton, architect and surveyor, the order for discharge from bankruptcy has been suspended for two years, ending September 20, 1897.

The Board of Management of the Manchester Royal Infirmary voted, on Monday, £1,000 to be expended in the consultation of an architect, the preparation of plans, and estimates for a new building.

A lecture on "Rembrandt True and False," with illustrations, was delivered yesterday (Thursday) afternoon by Sir Francis Seymour Haden, F.R.C.S., P.R.E., in the Lecture Theatre of the University Museum at Oxford. This lecture was given at the invitation of the Curators of the University Galleries, who arranged for exhibition in the galleries a large series of the etchings of Rembrandt, placed approximately in chronological order, as determined by Sir Seymour Haden.

At Dumbarton, on Monday, Provost Blair turned on the gas to a large new holder which has been erected at the Corporation Gasworks. The new tank is of telescopic design, and has a capacity of 125,000c.ft. The contractors are Messrs. Laidlaw and Son, of the Barrowfield Ironworks, Glasgow.

Mr. W. N. Colam, of Westminster, waited on the Lord Provost's Committee, at Edinburgh, recently and explained a report he had submitted for converting the existing tramway lines to mechanical haulage. Finally Mr. Colam received instructions to prepare his plans for the immediate equipment of twenty-four miles of track, and to prepare machinery with power to work eleven miles more of extensions.

The urban district council of Hornsey, N., have raised the salary of Mr. Lovegrove, who was elected as their surveyor twelve months ago, from £500 to £600 a year.

The urban district council of Crewkerne are about to proceed forthwith with the extension of the eastern sewerage system outfall, under the direction of Mr. B Slade, their surveyor, the Local Government Board having sanctioned the borrowing of £5,500 for carrying out the works.

The sale of the Somerset and Dorset estates of Viscount Bridport began at Taunton on Wednesday. The prices obtained were not high, and many of the lots were withdrawn.

The municipality of Paris having granted 20,000 francs for the purpose, new buildings are to be erected at the Salpétrière Hospital for the treatment of nervous and mental affections by electricity.

Intercommunication.

QUESTIONS.

[11442.]—**Woodworking.**—I should be extremely obliged if you, or any of your readers, could inform me of a systematic method of obtaining and proportioning the cost of working of five working machines—viz., two circular saws, truing up, thicknessing, and vertical spindle machines, driven by gas-engine and worked by a man and youth, who fill up spare time at the joiners' bench. The main difficulty lies in the fact that the thicknessing machine and large saw use three or four times more gas power than the spindle and other machines. —Woodworker.

[11443.]—**Oil Gold.**—Will someone kindly inform me whether gold leaf or gold paint is intended to be used by the following expression—viz., the mouldings to be "gilded in best oil gold"? Being a matter of dispute, a reliable opinion would be valued.—H. B.

REPLIES.

[11437.]—**Concrete Floors.**—For a stable, a safe total load per square foot may be taken at 300lb. I should say the joists you propose are quite sufficient filled in with cement concrete. The latter may be made of Portland cement and coke breeze 1 to 4. Coke breeze is light, and has many advantages for wooden floors, as it can be nailed to, but where strength is required, broken brick or slag is better. As to the safe load per foot super. of a floor of cement and breeze 9in. thick, experiments vary too much to afford any certain data. Col. Seddon's tests of supported slabs are given in Sutcliffe's treatise on Concrete; but the dimensions given would support a much greater load than that of horses.—G. H. G.

[11438.]—**Discharge of Pipe.**—

$$28\sqrt{\frac{d^5 \times F}{L}} = \text{supply in gallons per minute.}$$

$$28\sqrt{\frac{4^5 \times 167}{20{,}460}} = 28\sqrt{\frac{1{,}024 \times 167}{20{,}460}}$$

$$28\sqrt{\frac{171{,}008}{20{,}460}} = 28\sqrt{\frac{42{,}777}{5{,}115}}$$

$= 23 \times$ say, $2\frac{3}{4} = 77$gal. per minute $= 77 \times 60 \times 12 = 55{,}440$gal. per day.—Allen T. Hussell, Ilfracombe.

[11440.]—**Lead Lettering.**—"Bristol" asks, When did this come into use? I should say that it is perhaps the most ancient form of known inscriptions, for it is mentioned in the Book of Job, 1520 years B C. See Job xix. and 24th verse, where, in the land of Uz, it was customary to put important records on the face of the rocks, many of which, some in Egyptian and some in the ancient Greek, are to be seen at the present day, though no doubt of later date than the time of Job, who, wishing to make a permanent inscription of his faith, would have it cut in the rock with an iron pen—*i e.*, a steel tool, and leaded in for its greater permanence. It is, therefore, only reasonable to suppose that lead was used for this purpose at his time—viz, 3,415 years ago. It is quite certain that lead was known as a metal previous to this time, and is probably the most ancient of the metals in the order of human discovery.—K. MacP.

[11440.]—**Lead Lettering.**—In the graveyard of East Brent Church, in Somersetshire, I recently noticed an old inscription on a headstone, all the letters being inlaid in lead, The wording, I see on reference to my pocket-book, ran:—"Here lyeth ye body of Grace, ye wife of N. Barrow, who dyed Sept. 21, 1705." The face of the stone (under an old yew-tree) is much worn away, but the inlaid metal lettering is in excellent preservation. This is the oldest example I know.—Harry Hems.

[11441.]—**Fungus.**—The fungus you complain of growing round the ends of joists in the stone basement walls and other parts is no doubt the particular kind which is the cause of "dry-rot." The rotten ends of the joists, if still firm, had better be cut off and replaced, or iron shoes made; other less affected parts may be treated with a pure solution of corrosive sublimate in water, used hot (one ounce to a gallon has been recommended), and may be used as a wash, or wash the parts with dilute sulphuric acid, after scraping off all the fungus. The want of a cavity in the basement wall is the cause of the mischief, and there is probably no sufficient ventilation. Unseasoned timber in such conditions become a prey to dry-rot. All the roots discovered should be cut away, and the wall, if possible, rebuilt in the portions complained of. The ends of joists are often exposed to the fungus of dry-rot, or, as it is named, *Merulius lachrymans.* —G. H. G.

◆

A monument is to be erected in Quebec to the memory of Samuel de Champlain, whose name is so intimately connected with the early history of Canada. Artists, sculptors, and architects are asked to send in plans, models, or drawings up to Jan. 2nd, 1896. The cost is not to exceed £6,000 sterling.

Since the Yōst Typewriter Co, L'd., moved into their new premises at No. 50, Holborn-viaduct, a few weeks ago, two more gold medals have been awarded to the popular Yōst, raising the total number to ten. The Belfast Art and Industrial Exhibition was the occasion of the most recent award.

The memorial stone of the new theatre being erected in High-street, Stratford, was on Monday laid by the Mayor of West Ham. The architect is Mr. Frank Matcham, of Warwick-square, W.C. The new theatre will be erected by Messrs. Perry, of Bow. The interior will consist of three tiers of boxes, and will seat an audience of over 3,000. It will be built on the cantilever principle, with a capacious pit and gallery, doors opening outwards. The cost will be £32,000.

Legal.

THE NEW LONDON BUILDING ACT.

THE London Building Act, 1894, by Sec. 212, provides that any building begun, or "which is to be carried out under any contract entered into before the passing of the Act," may be completed under the old law, and shall be exempt from the provisions of the new Act. In the recent case of "Tanner v. Oldham" (*Times*, Oct. 27), a very important practical point was raised, and so far decided as to the meaning of the term "contract" as used in that section. It appeared that in January, 1894, a building agreement was entered into between the Haberdashers' Company and the respondent to build, amongst other houses, five in the Musgrave-road, Deptford, at a cost of not less than £380, and subject to plans and the approval of the company's surveyor. The agreement affected 43 houses altogether, and they were to be built so many per year spread over four years. It was also agreed that the work should be done in accordance with the Acts for the time being in force.

When notice was given to the district surveyor as to the five houses at Deptford in March, 1895, he objected that the proposed plans were not in accordance with the requirements of the new Building Act of 1894, and so the point arose whether the new Act applied, as the contract was made before it had been passed, and ultimately a case was stated for the opinion of the Court. It was argued for the surveyor that the contract named in the Act was the contract for the actual building, and not an agreement like this, which was to spread over four years. But Justices Cave and Wright did not adopt this view. They said that the surveyor's argument amounted to saying that the word "contract" ought to read as meaning "specification." The words were very wide, and there was no reason why their scope should be cut down so as to include only contracts for actual building. Mr. Justice Wright, indeed, went further, and held that, as this was not a public Act, it might well be taken that this clause was really a compromise, and so one that should rather be widened than narrowed in its interpretation. So this agreement, which is to extend to 1899, at all events, was held to be exempt from the Building Act, 1894.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

C. R.—Wall.—Bay Window.—View.—This raising of the wall cannot really have reduced your light or air, though it may spoil the view. But the law does not recognise any right of property or easement in a view or prospect; and so I do not see that you have any legal claim to damages.

J. B.—Wall.—Land.—Easement.—Unless the adjoining owner is under some covenant to keep his land walled in, he would probably have the right to pull down a wall built upon his own ground, and leave you to erect a wall or fence for yourself. There seems no evidence of any easement in this case, and at all events 30 years' user would be needed.

T. E—Ancient Light.—Angle.—Building.—There is no rule of law as to the angle of light. If your proposed building does not in fact reduce to any substantial extent the light hitherto enjoyed by these windows, then you would be safe. The angle of 45° is not conclusive, though it is often sufficient. The Court would decide upon the evidence of former light, and its recent or probable diminution.

◆

William Mead, a bricklayer, was charged at Stratford Police-court on Wednesday with intimidating George Boreham, a fellow workman. Messrs. Mowlem and Co. are building a Board school at Barking, and, consequent on a strike, they had to employ "free labour." The complainant was taken on under this condition, and it was stated that the prisoner, among others, abused and threatened him. A remand was ordered.

The corner-stone of the new district church of St. John, Hendon, was laid by Princess Christian on Wednesday. The first section of the church, which is being built near the railway station, will seat 500 persons, and will cost £4,000. It will be eventually enlarged so as to accommodate 1,000 worshippers.

The Staffordshire County Council met on Tuesday for the first time in the new council hall, the cost of which is estimated to be £50,000.

Mr. Rowland Plumbe, F.R.I.B.A., of Fitzroy-square, W., has been elected Master of the Painters' Company.

LEGAL INTELLIGENCE.

Construction of the London Building Act, 1894.—Tanner v. Oldham.—(Queen's Bench Division, Oct. 25, before Mr. Justice Cave and Mr. Justice Wright.)—This was an appeal by special case from the refusal of a police magistrate to convict under the London Building Act, 1894. The question arising was this—whether a contract made before the passing of the Act of 1894 to erect a series of houses from year to year came within the exemption in section 212 of a contract entered into before the passing of the Act under which a building, structure, or work is to be carried out. The respondent was a builder, and on March 19, 1895, he served on the appellant, who is the district surveyor under the London Building Act, 1894, for the district of Hatcham, a notice which stated that the respondent would build five dwelling-houses on the north side of Musgrave-road, in St. Paul's, Deptford. It appeared to the surveyor that the houses proposed to be erected would be in contravention of the Act of 1894, and he accordingly served a notice of objection under section 150 of the Act. It was stated that the buildings proposed to be erected would be in accordance with the Building Acts in force before the Act of 1894 passed. The respondent appealed to the magistrate on April 5 against the notice of objection. It was then proved that, under a building agreement of January 3, 1894, made between the Haberdashers' Company and the respondent, the respondent agreed to erect no less than 43 dwelling-houses, to be built of such classes and descriptions, in such position, in such manner, and otherwise as should have been previously approved of by the company's surveyor; and it was agreed that five of such houses should be erected on the north side of Musgrave-road, should be built at a cost of not less than £380, and that the plans, &c., should, previously to the commencement thereof, be submitted to and approved by the said surveyor. It was also agreed that six houses should be finished before March 25, 1895, ten more in 1896, 1897, and 1898, and the remainder in 1899. It was further agreed that all the works should be executed in accordance with the regulations of the Metropolitan Building Act, and any other Act of Parliament, whether local or general, for the time being affecting the premises. The London Building Act, 1894 (57 and 58 Vict. cap. 213) provides as follows by section 212: "Notwithstanding anything contained in this Act, a building, structure, or work which has been commenced before, and is in progress at the commencement of this Act, or which is to be carried out under any contract entered into before the passing of this Act, may be completed subject to and in accordance with the provisions of the Acts relating thereto as are in force immediately previous to the passing of this Act." Mr. Cripps, on behalf of the district surveyor, urged that the contracts exempted from the provisions of the Act of 1894 by section 212 were not contracts such as this. The words of the section, "building, structure, or work," pointed to a contract for carrying out a particular building; it did not apply to a contract of such a general character as the present, which was to be in force for four years. It was not impossible that there might be contracts to take effect for a much longer period still; moreover, the contract provided for fresh Acts becoming applicable. The Court, however, after hearing Mr. Jelf, supported the decision of the magistrate. Mr. Justice Cave said he was asked to hold that the word "contract" in the section meant specification. If this had been intended, it would have been very easy to say so in the section. The words, however, were wide, and the contract in question came within them. The provision in the contract about the buildings being executed in accordance with any Act of Parliament for the time being affecting the premises did not carry the matter further, because the real question was whether the Act applied to the contract at all. Mr. Justice Wright concurred. He thought that the Act not being a public Act, it might be presumed that the insertion of a clause of this description was in the nature of a compromise, and, at any rate, the words should rather be widened than narrowed in interpretation.

The fifteenth session of the Institution of Junior Engineers will be inaugurated this (Friday) evening by a meeting to be held at the Westminster Palace Hotel, Victoria-street, S.W. The chair will be taken at eight o'clock by Professor Alexander B. W. Kennedy, past-president, and an inaugural address will be delivered by the president elect, Mr. Archibald Denny.

The County Court Judge for Kent, on Wednesday in last week, decided in favour of the defendants in an action brought at Chatham against the Formby Cement Works Co., Limited, by a labourer named John Nicholls, residing at Upper Halling, to recover £156 as damages for injuries, including a broken rib, received by him whilst at work on the 7th March last, owing to the defective condition of a portion of defendants' works at the opening of the deep chalk-pit sunk by them.

Our Office Table.

The annual *conversazione* of the Architectural Association was held on Friday evening at the King's Hall, Holborn Restaurant, and was very largely attended by members and their lady friends. A reception was held in the great hall by the President (Mr. W. D. Caröe) and the committee. The students' prize and other drawings executed during the past season were on view on the walls of the council chamber, and a large selection of mounted photographs executed by members of the A.A. Camera Club. The loan exhibits were reduced to smaller limits than has been the case during the past eight or ten years, and a regrettable feature, too, was that in no case was the designer's name attached to the fabrics shown. Messrs. William Morris and Co., of Oxford-street, W., had a choice display of wall-papers, chiefly of large, flowing, "all-over" patterns in low tints, and hangings. Messrs. Essex and Co., Victoria-street, S.W., also showed a number of wall-papers and hangings. Messrs. White, Allom and Co., Mount-street, W., exhibited furniture carved in low relief, in the styles of the Brothers Adam and of Louis XIV. to XVI. Mr. Alfred Stalman, Frith-street, Soho, had on view rich embroideries, dossals, altar-cloths, and church furniture, and Messrs. Vickers and Co., Bucklersbury, sent some tapestries, &c. The features of the evening's entertainment were the excellent selections of classical music performed by the members of the Rebec Orchestral Society, numbering 44 performers, the bâton being wielded by Mr. W. Horsey, hon. conductor, and as a lighter element, the banjo performances and songs of the well-known three Pierrots and Pierette, under the direction of Mr. Clifford Essex. The proceedings passed off successfully in every particular.

The new *Kalendar* of the Royal Institute of British Architects has just been published in readiness for the session of 1895-6, which will be opened on Monday evening next by Mr. Penrose's presidential address. Papers will be read during the forthcoming session on November 18, December 16, Feb. 3 and 17, March 16 and 30, April 20, and May 18. The prizes will be distributed, and a presidential address delivered to the students, on January 20; the special meeting for the election of the Royal Gold Medallist will take place on March 2, the annual general meeting on May 4, and the presentation of the Royal Gold Medal on June 22. Business meetings of members only will also be held on December 2, January 13, and June 8. The *Kalendar* increases in bulk year by year, and now numbers 352 pages against 311 in 1894-5. The number of Fellows is now 596 against 617 in 1894, 628 in 1893, and 617 in 1892; and the number of Associates is 924 against 872 last year, 828 in 1893, and 806 in 1892; and of hon. Associates 61, the numbers for the preceding three years being 60, 65, and 66 respectively. The total of subscribing members is thus 1,561, against 1,549 in 1894, 1,521 in 1893, and 1,489 in 1892. In addition to these there are also 11 hon. Fellows, 7 retired Fellows, and 55 hon. corresponding members, 142 students, and 708 probationers—two classes which show each year progressive increases. The grand total of members is 2,504, as compared with 2,273 in 1894, 2,122 in 1893, 1,922 in 1892, 1,739 in 1891, and 1,259 in 1885.

The opening lecture of the series to be given this season in connection with the Auctioneers' Institute was delivered on Tuesday evening in the large arbitration-room at 63, Chancery-lane, W.C., by Heber Hart, LL D., Barrister-at-Law, who took as his subject "The Law of Fixtures." The chair was occupied by the President, Mr. Frank Everill. The law relating to the annexation of fixtures from the soil, and to trade fixtures, and removable fixtures was lucidly explained and commented upon by Dr. Hart, who, in the course of his lecture, enumerated some of the articles which came under those various heads, and showed the difference of opinion that exists, even among judges and lawyers, upon the law relating to the removal of trade and other fixtures, as many of the judgments which have been delivered from time to time have confused the issue at stake. A discussion followed in which Messrs. E. George, of Newcastle-on-Tyne; J. F. Field and E. Pennington, both of Richmond; Norman, Peck, J. L. Johnson, E. J. Vaughan, and G. G. Hanham took part, and a hearty vote of thanks was accorded the lecturer.

The syllabus of future meetings for the present session of the Auctioneers' Institute, held on Tuesday evenings, in the large arbitration room at 63, Chancery-lane, W.C., is as follows:—Nov. 26, Henry Lynn, M.S.B.L., Barrister-at-Law, upon "Compulsory Purchase"; Jan. 7, 1896, E. W. Richardson, F.A.I., upon "Copyhold Enfranchisement" (Paper II.); Jan. 28, H. C. Richards, M.P., Barrister-at-Law, upon "The Law and Practice of Compensation in the County of London"; Feb. 25, John Hepper, F.S.I., F.A.I. (Leeds), upon "Provincial Auctioneers: Their Position, Practice, and Prospects"; March 6, lecture by A. J. Ram, Barrister at Law (Recorder of Hanley), upon "Valuations and Appraisements"; March 24, James F. Field, F.S.I., F.A.I., upon "Auctions: their Use and Abuse."

Blackpool, which already rejoices in a miniature Eiffel Tower some 500ft. in height, is about to add to her attractions a Great Wheel, to be built by Mr. Bassett, the engineer and constructor of the one at Earl's Court, and this novelty will be ready for use by next season. Mr. Bassett proposes that the new wheel shall not be quite so large as that now working at West Kensington, but it will accommodate more people at one time, and by making four revolutions per hour will carry 5,000 persons during that period. The enterprise is to be carried out by the Blackpool Winter Garden Company, who are now adding to their property a dancing hall, new floral halls, and a fresh elevation to Victoria-street.

At Bridlington, also, an effort is being made to attract pleasure-seekers. A limited liability company have purchased an extensive reach of foreshore and building land on the Hilderthorpe side. The land has a sea frontage extending a mile and 200 yards, of which 156 acres will be available for gardens and residential and public buildings. The remainder—over 30 acres—is foreshore. It is proposed to build a sea-wall along the entire length of the frontage, to have an inclosed spa and gardens, and to lay out a marine walk with a concurrent drive at the rear of the estate. The widest part from the sea-wall to the roadway is about 175 yards in depth. The foundations of the foreshore are considered absolutely reliable by Mr. Dixon, who built the wall at Filey, and this opinion is confirmed by Mr. William Beswick Myers, civil engineer, of Leeds, Filey, and London, one of the directors of the new company. The wall will furnish a promenade walk 36ft. wide along its whole length. A sloping bank of grass will lead to a second promenade, and behind the two there will be flower-gardens and lawns, ornamental lake and fountains, and tennis-court. The winter garden buildings will be semicircular, with the end frontages facing the sea. On the frontage of one end will be verandahs and balconies, rising to three stories, and surmounted by minarets, while the ground floor will contain refreshment and dining-rooms and buffets, and billiard saloons. Behind the other frontage will be a concert-hall or theatre of varieties, reading and news-rooms, and visitors' club. The bulk of the land not used for ornamental purposes will be allocated to villas, for it is not proposed, should the scheme prosper, to allow the erection of houses which would be architecturally inferior to the general plan of the front. In the centre of the court formed by the buildings there will be a band stand. There will be sea-water baths, and, later on, a promenade pier will be built. Hilderthorpe Lodge and grounds will be laid out as strawberry and tea-gardens, with athletic ground and bowling-green, and the whole of the buildings will be lighted by electricity and gas. It is also proposed to lay down an electric tramway through the estate from Hilderthorpe Lodge to the railway station, and possibly the line may be afterwards taken to Flamborough.

A correspondent points out that the arbitration as to the value of the St. John's Wood estate of the Eyre Trustees by the Manchester, Sheffield, and Lincolnshire Railway, the hearing of which closed on Thursday in last week, is by no means, as Sir Edward Clarke claimed, the largest case that has ever arisen under the Lands Clauses Act. As a matter of fact, the claim brought by the Earl of Derby against the Lancashire and Yorkshire Railway Company for the acquisition of property from his lordship's estate for the existing line of railway from Manchester (Victoria Station) through Cheetham Hill, Prestwich, and Radcliffe, was in many respects more important. The claim was for £500,000. The hearing of the case in London and Manchester occupied twenty days. The valuations of half-a-dozen surveyors in support of the claim ranged from £440,312 to £402,830, and the award of the sole arbitrator, Mr. T. B. Foster, C.E., of Manchester, amounted to £178,313.

The Salford Town Council received on Wednesday a report of the special committee appointed with reference to the borough engineer's department. The committee stated that they had come to the conclusion that the department of the borough engineer prior to Mr. Corbett's appointment was in a very unsatisfactory condition, and that the accountancy department especially had been permitted to lapse into a state of confusion. The evidence proved that, upon Mr. Corbett assuming the office of borough engineer the department was in a state of disorganisation; that the bookkeeping was in arrear, and the accounts in confusion; it appears to the committee that, although aware of the irregularities, the engineer did not alter or put in order the bookkeeping until the finance committee insisted upon the arrears being brought up to date. Since the dismissal of an official, twelve months after the appointment of Mr. Corbett, the accountancy of the department has undergone a complete transformation, and is now on a satisfactory footing. As the work of the engineer in connection with the Agecroft destructor, which was erected from his plans, the committee state that he committed a grave error in leading the committee to conclude that the plans placed before them could be carried out for £2,050. In respect of the extras incurred, they complain that estimates were not drawn up for contingent works required outside the destructor, such as gas and water fittings and other items as set out in the statement of cost of the destructor, amounting—beyond the original contracts of £2,552—to a total of £1,136 12s. 2d., this sum being exclusive of £258 0s. 8d., incurred in altering the destructor as it now stands, and making the total cost £3,947 13s. 2d. The actual outlay, contingent on the change of site, did not cost £700, as reported by the borough engineer at the Local Government Board inquiry, but £310 4s. 3d. as the result of actual measurements.

It is proposed to hold in Vienna an historical exhibition, referring especially to the times and persons connected with the Vienna Congress, 1815, on which England was represented by Lord Castlereagh and Sir Sidney Smith. The exhibition will be open from January 1 until the end of May, 1896. The sections of the exhibition, comprising all objects of the Empire style, will include:—Portraits, medals; pictures or prints showing the events, festivals, processions, &c., of the times; contemporary views of Vienna and its neighbourhood; fashions, costumes, uniforms, &c.; autograph letters, furniture, silver and gold plate, glass, Vienna porcelain, tissues and embroideries, jewelry—in short, all relics and objects which are connected in one way or another with the celebrities of those memorable days and the Napoleonic era.

Vast sums are being expended, and are about to be spent, at Johannesburg in brick and mortar; there are to be new churches, theatres, hotels, arcades, business premises, and private houses. A remarkable feature of this building boom is the number of buildings of four and five stories in course of erection and in contemplation. There is a good bottom to be got for a foundation at a depth of 8ft. or 9ft. from the surface; and all the larger buildings going up now have cellars underneath. Most of the houses in Johannesburg are built of brick. The bricks turned out now are fairly good, and they are a great improvement on what used to pass muster. The price at present is from £3 10s. to £4 per thousand; stone is not much used for building purposes in Johannesburg. House property is paying 15 per cent. in the town proper, and in the suburban districts 20 per cent.

The following building regulations are enforced in Stockholm:—(1) First-class houses must be constructed of either stone or brick. (2) The stairs of all such houses must be either of stone or iron, and fixed in stone walls from cellar to attic, having at least a thickness of 1ft. (3) Cellars must be constructed of massive stone arches, founded in mortar or cement, and must support the ground or basement floor. This floor should be constructed of iron beams, and the spaces between filled with broken brick, gravel, mortar, or clay, rendering it firepoof. (4) The attic must be constructed of fireproof masonry filled in between the beams of the upper surface, constructed of bricks, or tiles sunk in mortar or cement, forming a continuous solid floor over the beams. (5) Iron doors sunk in stone doorways shall be fixed for the closing of attic as well as cellar, and the doors locked at night to arrest draught in case of fire. (6) Where elevators are permitted, the shafts must be constructed of solid masonry, and all doors opening upon the shaft must be of iron, and close automatically. (7) Roofs must be cevered with tiles, slates, or sheets of metal. (8) The external walls of the house must be fireproof, and at least a foot in thickness. (9) The height of a building should, in general, not exceed the width of the street, and in no case exceed 69ft. (10) Only two-thirds of a plot of land must be built upon, leaving one-third for open spaces, but in the case of corner plots the houses may cover three-fourths of the area. (11) All flues and chimneys must be of ample size. (12) They must be regularly swept and regularly inspected officially.

◆

A fire broke out at Perth, Western Australia, on Sunday, which destroyed the Fremantle Railway Goods Sheds and the Queen's Warehouse. The damage is estimated at £50,000.

The Church of St. Stephen's, which has been for some time in course of erection at Craigie, Perth, is rapidly approaching completion, and will be opened in December. The church is in the Transitional Norman and Early English style, and is seated for 600 worshippers. It has cost about £5,000, and has been erected from designs by Messrs. J. and G. Young, architects, Perth.

On Saturday, at Dukinfield, Miss Astley formally handed over to the chairman of the Dukinfield District Council the deeds of the ground on which have been built the new premises of the Technical School. The new building, which takes the form of an addition to the first technical school, erected by Captain Astley in 1875, has cost £4,000. Every convenience is provided for the 450 students in attendance.

The Southampton Harbour Board have in contemplation an important scheme of electric lighting which involves an estimated outlay for station and plant of nearly £6,000. It is proposed to erect the station near the harbour offices on the Town Quay. The scheme is not yet fully developed, the plans having been sent back to the committee for revision

A proposal is under consideration for making a connection of the Great Western Railway at Tetbury—a branch from Kemble Junction—through Avening, Nailsworth, Newmarket, Uley, and Dursley with the Severn and Wye Railway at Berkeley-road, the Midland junction for Severn Bridge, and the Wye Valley. The proposal emanates from manufacturers and others at Nailsworth.

A claim by the Duke of Newcastle for compensation for the subsoil and minerals extracted by the Manchester, Sheffield, and Lincolnshire Railway Company in their tunnelling operations at Nottingham was tried on Saturday by Mr. Cripps, Q.C., M.P., sitting as umpire in Queen's Bench Court VI. Mr. Calvert, engineer, the borough surveyor, and others having given evidence, the umpire reserved his award.

The yearly report of the Building Committee of the Bradford Corporation shows that during the past municipal year they had approved plans for 532 new dwelling-houses, against 535 in the previous year, and 1,036 in 1893. Plans for 15 new warehouses and mills, as against 28 in 1894, 20 in 1893, and 23 in 1892. The plans of six churches and schools were approved. Twenty-seven new streets have been approved during the twelve months. Twenty-nine of the new houses have twelve rooms each.

Mr. George Baines, F.R I.B.A, 4, Great Winchester-street, London, E.C., has been asked to act as architect for a new Baptist church, to be erected in London-road, Lowestoft. Plans have been adopted which will involve an expenditure of over £3,000.

The successful completion of the sub-aqueous portion of the Blackwall Tunnel was celebrated on Wednesday by a luncheon given by Messrs. Pearson and Son, the contractors. Though the passage under the river is now complete, except that it is not yet lined with white brick, and the roadway is not formed, there remains much more to be done, and it is unlikely that the tunnel will be ready for traffic for 18 months yet. On the north side scme 1,200ft. of tunnel have yet to be made. The tunnel will be open for inspection by the public to-morrow (Saturday) and on Sunday, between 10 a.m. and 10 p.m., for the benefit of the Poplar Hospital for Accidents. The charge for admission will be 3d. Mr. W. Crooks, member of the London County Council for Poplar, will meet the parties and explain the nature of the works between 4 and 7 on Saturday, and 6 and 8 on Sunday.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Society of Engineers. "Strains on Railway Axles," by Thos. Andrews, F.R.S., United Service Institution, Whitehall. 7.30 p.m.
Royal Institute of British Architects. Inaugural Address by the President, F. C. Penrose, F.R.S. 8 p.m.
Tuesday.—Glasgow Architectural Association. "Organ Building," by Hugh Dale. 8 p.m.
Wednesday.—Royal Archæological Institute. "Garlands," by E. Peacock, F.S.A.; "Signs of Old Fleet-street," by C. Hilton Price, F.S.A 4 p.m.
St. Paul's Ecclesiological Society. "The Ecclesiology of Ogham Inscriptions," by R. A. S. Macalister. 7.30 p.m.
Carpenters' Hall Lectures. "Sanitary Requirements," by Professor H. Robinson. 8 p.m.
Friday.—Architectural Association. "Pompeii," by Talfourd Ely, M.A. 7.30 p.m.

CHIPS.

The old town hall at Cowbridge, Glam., built in 1830 on the site of the Bridewell, was reopened on Thursday in last week after renovation, including the enlargement of the chief room by 100 sittings, and the provision of a new suite of rooms on the ground floor. Mr. C. B. Fowler, F.R.I.B.A., of Cardiff, was the architect, and Mr. Alfred Jones, of Cowbridge, the contractor; the cost has been £900.

The Northallerton Rural District Council have elected Mr. Richard Burton as surveyor of highways.

Mr. W. J. Bird Clerke, M.I.C.E., an inspector for the Local Government Board, held an inquiry at the Town Hall, Cardiff, on Thursday in last week, into the application of the town council for sanction to borrow £12,885 for purposes of electric lighting, £1,576 for the improvement of Roath Park, £500 for the purpose of public lighting, and £200 for laying out Windsor Esplanade Gardens. Evidence in support of the proposals was given by Mr. W. Harper, borough engineer, and by Mr. Massey, electrical engineer to the corporation.

Chard Town Council adopted, on Friday, a scheme for the disposal of the sewage of the town at an estimated cost of £4,500 and an annual outlay of £354. The outfall will be on the eastern side of the town, at Tooches, the plan providing for treatment by chemicals partly, and partly by irrigation.

The Royal Society of New South Wales, whose house is in Phillip-street, Sydney, have just had painted, on the flat surface of the plain stone front, a "cornice" with truss blocks. The building is about 30ft. wide, and this cornice runs across about 28ft., leaving a foot at each end for return!

The United Free Methodist chapel at Hopwood, Lancs, was reopened last week after alterations, carried out by Mr. D. Blakeley, builder.

A provisional license has just been granted by the Hants justices for a large hotel proposed to be built on the western side of Alum Chine, Bournemouth. The hotel, of which Mr. Moore is the architect, will cost about £10,000, and will contain 43 bed and sitting-rooms, besides the usual public apartments.

St. James's Church, Mangotsfield, was reopened after restoration, the works including renovation of seats and removal of pew doors, repairs to masonry and roofs, and provision of new lectern in oak. Messrs. Hatherley and Carr, of Bristol, were the builders.

Operations have been commenced for the extension and restoration of St. Mary's parish church, Todmorden. The scheme includes the erection of a chancel at the east end, estimated to cost £1,000. The plans of Mr. Medland Taylor, Manchester, have been selected. The improvement will include a stained-glass east window, as a public memorial of the late John Fielden, Dolroyd Castle, Todmorden, and Grimston Park, Tadcaster.

The Mayor of Accrington laid, on Saturday, the foundation-stone of a cottage hospital for the Accrington district. The building will cost about £4,000.

On Saturday the foundation-stone of the Glasgow Masonic Halls was laid by the Provincial Grand Master, Mr. John Graham, of Broadstone. The building is situated at 98 and 100, West Regent-street. The part fronting the street will be five stories in height, and will be let for commercial purposes. At the rear will be a large Masonic hall, measuring 65ft. by 40ft., and capable of seating about 450 persons. Adjoining will be two lodge rooms. The buildings will cost about £16,000. Mr. J. L. Cowan, I.A., of Glasgow, is the architect.

Two statues are about to be erected, facing each other, in the Red Row at Calcutta. One is in honour of Lord Roberts, and the other of the Marquis of Lansdowne, and both will be executed in London by Mr. Harry Bates, A R A.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXIX.—No. 2131.

FRIDAY, NOVEMBER 8, 1895.

SOME PERILS OF CIVILISATION.

WE are often told, though not so often now as in the twenty years of national self-glorification which followed the first Reform Bill, that "Peace has its victories, not less renowned than War." But we hear little of the price which Peace has to pay for them. Even here, nothing is to be had for nothing. In mechanical conquests, as well the territorial ones, men have to give their lives. How many colliers perish annually to provide our factories with fuel? How many railway workmen are maimed or killed that we may ride about in luxury? The same sort of question might be asked about all those other industries which make the modern world what it is. We do not see the heaps of slain, we do not hear the cries of the wounded, and we try comfortably to imagine that they do not exist. "Half ignorant, we turn an easy wheel, That sets sharp racks at work to pinch and peel." But, once in a while, we catch our own fingers in the machinery. Then we drop our platitudes about the victories of peace and the triumphs of civilisation. We get a glimpse of the reality, and it is well for us and for others that this glimpse should not soon pass from our recollection.

The latest of these accidents, as we write, though by the law of chances it is likely enough that a still later one may have occurred before this number is in our readers' hands, is what the newspapers have named "The Strand Explosion." The average reporter, it is true, finds "explosions" everywhere. It is an "explosion" if some unfortunate child soaks its clothes with petroleum, and then sets light to itself while trying to dry them. It is a "terrific explosion," or was a few years ago, when the side of a great gas-holder gives way, and the gas burns quietly, though in a gigantic flame, 50ft. or 60ft. high. But in the Strand, the reporter seems for once to have been right. Not only did some houses entirely collapse, but people in others were thrown out of bed by the shock. "There was a terrible bang," and a mass of flame is said to have rushed out of the end of the court. For complete details we must, of course, await the public inquiry. But it seems hardly doubtful that this was only a more destructive example than usual of the gas explosions which take place nearly every week. It happened in a structure weakened by age, and perhaps not originally very strong; in a locality full of people, and in a place where its effects were concentrated for want of room. So it came to pass that, instead of the ordinary blowing-out of windows and the customary damage or destruction of the person who smells a leakage and goes to look for it with a light, more than 30 human beings suffered, and one has died. The fall of the houses most affected is, however, the singular feature of the present calamity. It does not seem fully explicable on the theory that the explosion only took place in the cellars. The topmost brickwork of the walls, too, is strangely injured. It is said that one of the ruined dwellings, at least, was built with hollow walls, and a theory is put forward that the gas, or rather the mixture of gas and air (because coal-gas alone is not explosive), accumulated in the cavities.

How far this idea is supported by facts we shall learn hereafter. But it certainly has possibility for its basis; and it deserves attention from those architects who adopt this peculiar mode of construction. Hollow walls seem to have been more in fashion formerly than now. They have been enthusiastically advocated in two or three of the professional journals, and they doubtless have their merits. But they have their dangers too, of which the one now in question is by no means the least. It is one not easily detected. If a gaspipe happens to be defective just where it passes into a dwelling from the outside, and if the inner skin of the brickwork is as sound as it should be, the occupant may practically be living, though he knows it not, in the midst of a powder-magazine, without the precautions which keep magazines comparatively safe. Some day a nail may be driven into a mortar-joint, or a few particles of mortar may fall out of one, and then the explosive compound in the cavity will pour in and light itself at the fires or burners. Again, if coal-gas can get into the cavity, sewer-gas may do the same. Its effects will be quieter; but, perhaps, in the end, not less deadly. Rats and mice, too, find a convenient habitation in the wall-spaces. They are mortal, even when let alone; and some people are unwise enough to poison them. If they die in their runs between the two thicknesses of brickwork, they will, as Henry V. said of his dead soldiers, "break out into a second course of mischief; killing in relapse of mortality." The arrangement, in short, which is to keep out damp, may keep in things which are even worse; and there will be no getting at them without knocking an originally weak structure to pieces. Possibly a hollow wall 16in. thick, if it stood alone, might take rather more wind-pressure to push it over than a solid 14in. one. But wind is seldom a source of peril in these islands. When structures fail, it is much oftener from pressures or thrusts arising out of their own construction; and to these a hollow wall offers little resistance. Suppose it to be made up of a 9in. and a 4½in. thickness, with a 2in. space between. Unless the cavity is to be extremely damp, the 9in. wall should be outside. But if it is, the internal joists and plates, the beams and trusses, will only have a half-brick wall to rest on; and though this may be bonded to the whole-brick one by ties at the usual intervals, it will be anything but a satisfactory support. In some of the South Coast towns, therefore, where hollow walls are in favour as a means of keeping out the driving rains, builders prefer to put the thinner wall on the exterior. This may answer their purpose when they build to sell; but will saddle the purchaser, in time, with difficulties he did not dream of. Moreover, the system is not as cheap as it looks. Inexperienced persons might expect that a mere cavity would cost nothing. In practice it is otherwise. It seems to be the custom to value it as solid brickwork, because of the extra trouble, and the cost of ties. When we add to this the cost of the contrivances, which in careful work have to be put over door and window frames to keep off dropping moisture; and when we allow for extra thickness of frames, or extra depth of reveals, we shall see that slate, or even tile-hanging would not be much dearer, and that a cement surface would be cheaper by far. But we do not advocate such cement architecture as one generally sees at Brighton, or such slate-hanging as disfigures Southampton. It takes an architect, and not an ambitious house-agent, to deal with these things; though, given the architect, there is a reputation waiting for him when he can put up new houses with slated walls as artistically treated as half a dozen old ones are at Penzance.

Artificial earthquakes are growing common here. Pedestrians who like a little excitement may look forward, any day, to seeing a few yards of the pavement or the roadway hoisted into the air, and may expect, if they have ordinary luck, to know how it feels to be hoisted with it. This, of course, is the result of the make-shift, hand-to-mouth system on which our gaspipes and our electric mains are laid. The rival illuminants, being two of a trade, seem never to agree. The gas leaks out into whatever spaces it finds vacant, and mixes with the air, so as to be ready for mischief. The electric current discovers a gap, and sets up a series of sparks there. All is now prepared. The gaseous mixture increases in quantity; it creeps nearer and nearer to the spark, and, as soon as it reaches it, explodes. No living soul knows whereabouts underground there may, or may not, now be vacancies for explosive gas. No living soul knows how near to any such vacancies a series of sparks may be set up. Hitherto these little convulsions have chiefly taken place out of doors. But it is quite likely that others will originate in disused cellars or coal-places, holding sufficient gas to produce really striking effects. Most lihely we are as yet only in the day of small things as regards our artificial earthquakes; "all that they have done, but earnest Of the things that they shall do."

We have had several cases in our highways of what Americans call "electrocution." Hitherto it has been chiefly practised on horses; but there is no guarantee that it will not extend to the public generally. The wires are laid too near the surface, and insufficiently protected. When the roadway is soft, a horse's weight forces his hoof through it, and down to the electric main. It soon scrapes off the insulating material, and then the unfortunate animal forms a complete circuit — one leg receiving the current from the main, and the other three conducting it back to earth. It is what the scientific mechanician would call "an elegant arrangement." But it is one which, like the artificial earthquake, ought not to be put into action to the detriment of private individuals. The companies which destroy life and property should have to give ample compensation. And when we look at the expense of this; at the constant outlay which must be incurred for inspection while pipes and mains are just "dug in" anyhow and anywhere; at the cost to the companies which is involved in perpetually taking up and making good the streets; at the loss to trade which the consequent stoppage of traffic involves, and at the risk to health from the leakage of coal-gas and sewer-gas into the houses and the air; we cannot but ask whether it would not be cheaper as well as better to form proper subways at once. They would not only keep gas and electricity and sewers from doing mischief, but they would protect the water-pipes from frost, and contain the overhead wires which make all attempts at beautifying our towns ridiculous.

NEGLECT OF STRUCTURAL DETAILS.

IT is a common complaint amongst artificers engaged in building operations that the modern architect, as a general rule, knows less of practical details than his predecessor of the old days. We often hear a mason or a joiner say they cannot work to a certain detail drawing; that the detail, if executed as drawn, would be unsafe or unsatisfactory, or that there would be a useless waste of material. And it is probably often true that the average young practitioner knows far less about the best mode of executing certain details than the practical workman himself. But it must also be admitted that if the architect of the present day understands some details of his craft less thoroughly than his predecessor, he has to master a far wider range of subjects, and become proficient in matters which fifty years ago would have astonished his ancestors. Besides the addition of a large number of buildings which were unknown at that period, the modern architect has to adapt himself and his work to the development of problems which are quite new. The applications of sanitary science, of heating and ventilation, electricity in its many forms are alone requirements which impose upon him duties and responsibilities which were unknown to his predecessors. Look, again, at the new materials he has been called upon to adapt to his purpose—iron, concrete, terracotta, plasters and cement, and a variety of decorative materials too numerous to mention. There is a further reason why practical details are sometimes neglected by the architect. The manufacturing specialist has arisen with the demands on his trade, and he undertakes to supply the details and specification for his particular work, and relieve the architect of the labour and responsibility. Thus the cast iron manufacturer employs his own engineer or draughtsman; the constructional engineer supplies the drawings of all details for column and girder work. The heating and ventilating engineer undertakes to arrange the scheme of warming and ventilating of buildings that may be intrusted to him; so, too, does the gasfitter and electrician not only undertake to carry out the lighting of a building, but to specify for all that is necessary under the general supervision of the architect; and in respect of decorative materials like terracotta and faïence, the manufacturer is willing to supply his own designs. Who can wonder that the younger and inexperienced members of the profession avail themselves of these facilities: they save themselves a great deal of labour and responsibility, while their remuneration is unaffected. The temptation is too great, when, for instance, the engineer, who has a separate contract, agrees to supply all the details of the ironwork of a large building from the general design or sketches of the architect, to test every girder, to make all the necessary calculations and stress diagrams. A very glaring instance of this delegation of duty to a contractor has lately come to light from America in the catastrophe which recently befell the Ireland Building at New York, and killed several workmen. At the inquest held it was almost proved that the direct cause of the catastrophe was the reduction in the thickness of the concrete footing of the iron columns which gave way. The footing had been reduced to one-third, or less, of the thickness specified in the architect's specification and shown on his plans. Who was responsible for this departure from the plans and specification which had been passed by the City Department? It will probably never be satisfactorily cleared up; but if an architect who has skilfully designed a detail of iron construction, such as the footing of an iron column or its size and connections with other ironwork, is to be held responsible for a contractor's variation from his design, then we must commiserate with him. The instance serves as a warning to the profession to be not too anxious to delegate to others the details of their buildings. Our trans-Atlantic cousins are largely in the habit of engaging specialists in construction; but such accidents as this draws attention to the importance of a knowledge of detail amongst architects, as well as supervision.

Certain stages of building, and particular kinds of construction, call for the architect's immediate and personal attention. We cannot agree with those who expect the architect to watch every drain that is jointed or brick that is laid, as such attention would be quite impracticable and useless; nor do we think he ought to be made responsible for every settlement that occurs, owing to the footings or concrete not having been made deep enough. These are details which cannot be guaranteed or tested without constant superintendence which an architect is not expected to give. He would have to make trial borings of all the foundations or trenches to ascertain what depth of concrete ought to be laid in every part; he would have to watch the gauging of every yard of concrete, the tipping and ramming in of each trench, the weight of every bushel of cement, its fineness and due admixture with the aggregate. The drains would have to come also under his inspection, and every joint tested; the bricks be closely watched, and all broken bats and "shuffs" discarded; he would have to see that the bond was perfect, and the joints properly flushed with mortar.

It would be preposterous to expect him to discharge these minute functions. But there are certain stages in the construction of a building which ought to receive his particular care. We may call them, first, the Preparatory or foundation stage; second, the Progress or certificate stage; and, third, the Completion stage. The first, or preparatory stage, would include the foundations, basement, and drainage work of the actual building, and the preparation of all working plans and sections for these works, the sizes and depths of the bases of all columns and piers, construction and bond of walls and other details. During this stage the architect ought to be more than ordinarily active in superintending and in perfecting his detail drawings according to actual requirements, in seeing that every footing and base to columns has been carefully dimensioned to his drawings. We consider this preparation stage the most vital and important in the whole progress of the building, as attention to details here might avoid costly settlements and failures hereafter. And as the work is commenced, and the "key-note" of the whole properly sounded at the starting, so it is more likely to be followed by the contractor and the workman. We have repeatedly observed that a bad or false start influences the progress of the work throughout. The workmen take their standard from a good or a bad commencement, and it is very difficult to afterwards rectify mistakes or improve upon the initial stage; especially is this the case with brickwork. The second or certificate stages of the work demand also care in supervision, and, lastly, at the completion of the building it is necessary to make a careful examination of the work before the final certificate is given.

Then there are certain kinds of construction, the details of which are not familiar to the architect. Of brick and stonework he may claim to be master—they are, *par excellence*, architectural kinds of construction with which he is most often called upon to deal; the majority of buildings are of these materials. In the same category we may name woodwork. Other trades are much less known. We may first incidentally refer to ironwork details. There are a very few architects who know much about them, as they are generally carried out by the engineer. When the architect is engaged upon any structure in which iron is largely used, such as a large factory, business premises, or a market, he generally obtains engineering assistance by employing someone accustomed to ironwork, or, which is very usual, he leaves the details entirely in the hands of the iron firm, or the contractor who does the work. As a general rule this practice is found to answer. The expert employed gives his skilled attention to the design, drawings, and specification; so too the iron firm, for their own reputation, can be relied upon; and it is better that the architect should delegate his details to an expert, than that he should take upon himself to make details that are faulty. The iron firm are careful at least that there is no unnecessary waste of material, and in this direction, perhaps, their interest in the contract may incline them to go further than the architect thinks desirable. If they can save a quarter or half an inch in depth on a number of steel joists or roof principals, or reduce the diameter of columns or tie-rods, they may make a saving of cost of no inconsiderable amount, but the building may lose a great deal of its appearance and apparent strength by the process. In a large building a quarter of an inch reduction on the ties and bars would save several hundredweights, and, therefore, the cost. But if the architect prepared the details he might be able to produce the same result more effectively than the smith and founder. Take, for example, the order: "Cast-iron columns to purpose-made pattern, with caps and bases drilled for fitments." The foundry engineer reduces the weight of each column by some alteration in the design of the base or capital, by omitting certain flanges or members on which its strength and appearance much depend. The result is a saving of half a hundredweight, reducing the cost per hundredweight, say, 7s. per column, which will possibly go into the contractor's pocket. The contractor has persuaded the architect that such alterations would be better, or an improvement on the design. It is in cases like this that the practical knowledge of iron details is of such value to the architect. We could mention numerous instances of patterns being altered with the architect's concurrence simply because he considered himself incompetent to insist on his own detail being carried out. How often do we find stock patterns of castings selected for the simple reason that the architect finds it easier to do so. In matters of constructional ironwork, like girders, steel joists, and flooring, the architect relies upon the practical knowledge of the contractor. He is made resposible for the testing and safe loading of the girders and floors. If there is anything wrong in the design the iron firm is supposed to rectify the mistake. The details are practically left to him. It is the same with other branches of the building. The joiner is presumed to point out any defect in the working details of staircases or window casements; the plumber has *carte blanche* to do what he thinks best under the general provisions of the specification, and it is the same with other trades of a technical kind. The details are left to the care of each craft. No doubt a large amount of thought and trouble is saved by the architect; but is the design really benefited? If there is some guarantee of security and efficiency in this delegation of detail, there is also a want of unity and design; the details are not in harmony with other parts; they are crude; the easiest and least costly mode of construction is adopted. The architect has lost control over these trades, simply because he has to some extent relinquished the design of their details. To take a common matter like gasfitting, the work is left entirely to the fitter. The specification only provides for the number of burners and their positions, thereby permitting the gasfitter to run pipes of insufficient diameter, or too large, for the supply of gas; and is it not the same with electric-light installations, hot-water piping, and nearly every other special trade in which the study of details becomes absolutely necessary to the efficient carrying out of the work?

ARE THE BUILDING TRADES DECLINING?

As we have been told that British agriculture is a thing of the past, so there are others who tell us of the decline of the building trades. On all sides we hear of the deteriorating influences of the want of proper apprenticeship, the evil of recruiting from the lower orders of each trade, the short period of servitude. In the old days men were taught the principles of their trades: the bricklayer was instructed in bond, arch, and gauge work, cutting and rubbing, and other manipulations; the carpenter went through a course of instruction in converting the raw material, in setting out roof-trusses, in constructing domical and circular roofs, semi-domes, in finding the hips and various bevels, in setting out arches and the construction of arch centres, in building up wooden beams and stiffening them, in modes of trussing, and scarfing, and tenoning. But now these things are "picked up" in a very haphazard fashion. The effects of this kind of training are now beginning to be apparent. The report on apprenticeship in the London building trades, of which we gave a summary last week, alludes to the results of the present system of training artificers; but there are one or two points of particular interest to the profession on which we may dwell briefly. First, the change in the *personnel* and character of some of the building trades, And for this purpose we take those of the bricklayer and carpenter and joiner as being specially influenced by modern conditions of work. Amongst builders it has been a general complaint that really skilful bricklayers who are able to do the best class of work are hard to find. Those who are competent to undertake the best work are few, and can consequently earn a higher wage. Arched and gauged work, including mouldings and cut-work, are quite beyond the province of the common bricklayer who has picked up his trade as a "learner"—by which term we mean one who has been admitted without agreement of any kind, often a raw boy-labourer employed by speculative builders. The report to which we allude speaks with some knowledge of the bricklayer's labourer. He begins by being put to work on an inside wall, in which duty he picks up something of the trade, though very imperfectly. To the rank of journeyman he reaches by obtaining employment on ordinary buildings. 'Having gained some knowledge of the craft under one firm, he obtains another berth, where he calls himself a bricklayer. He by this means escapes the vigilance of the real journeyman, who naturally wishes to exclude such men from his rank. In this way a class of men are introduced to the trade who are only able to do a very inferior kind of work.

Again, we have to consider other influences. Terracotta building has become a special branch of the trade requiring some knowledge of the material and mode of setting. Recently the practice of gauged work and arch-cutting, the requirements of ornamental or Queen Anne and Gothic brickwork, such as forming niches, oriel windows, gables, and moulded courses, have called for a class of experts who give themselves up to ornamental brickwork and cutting. There are thus three or four distinct branches, the effect of which is to alter the status of the ordinary bricklayer. The methods of setting out and applying bevels for arched work, of constructing groins, columns, and pediments, are unknown to the bricklayer who has chiefly been engaged in ordinary building.

Turning to the "carpenter and joiner," we are told that the title "has practically lost its old meaning." And there is much truth in this remark. Those who have watched the changes brought about by machinery, and by the importation of foreign joinery, must have clearly seen that this trade would be affected. The old-fashioned carpenter was a man well drilled in the principles of construction in timber. He could set out a king or queen post-truss, the ribs of a circular roof or dome, the hips and bevel of a roof. Now, as we are informed, he is "regarded as only capable of doing the rougher kinds of work, such as flooring, joisting, roofing, cutting moulds and centres for bricklayers, and attending on other trades." His work has developed into many branches. Formerly he was the general setter-out of the joiner's work, now the joiner directs. The latter is a "more skilled workman, as his outfit of tools indicates." The report to which we have referred says "the extensive use of machine-made joinery threatens to transform the joiner into a wood-fitter." Has it not done so already in the rank and file of the trade? Except the few specially skilled joiners who are employed on the highest class of work, the trade has been materially changed in consequence. He knows much less about the principles of his trade than formerly; his work is more mechanical and perfunctory in its finish, for he no longer exercises his skill in converting the material or in carrying through the design. Whether the "carpenter" proper will be soon extinct in London, as some contend, we do not know; but there can be little doubt that unless the carpenter can also turn his hand to joinery, he will have little chance of employment under the altered condition of the trade. The fact that the carpenter is now paid at a less rate than the joiner in many places shows very clearly that the former is in less demand. What we have said of these two trades is to some extent true of others. There has been a variation of type going on all round, owing to machine labour having been substituted for manual skill, with the result that the trades so affected have had to turn their attention to other branches. Thus it is well known that slaters now take tiling, which once belonged to a special class or to the bricklayer; the plasterer also interferes with the work of the latter in wall-tiling; the mason, who formerly worked in hard stone, takes soft stonework, and even brickwork and plastering; the ironmonger and smith often contract for plumbing work. All this "overlapping" is injurious to the real trades, and there is a natural aversion among workmen to the practice; therefore if the conditions of our industries continue to favour this interference, our building trades must suffer. A confusion is introduced into all building operations directly one man's trade overlaps another's, and the definite work and limits of each are lost sight of. To master builders and the architectural profession the questions we have raised are of importance, as it is to them the building artificer looks for encouragement of those things which tend to improve his technical knowledge and his position as a skilled workman.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the sixty-first session of the Institute of Architects took place on Monday evening at 9, Conduit-street, W. The President, Mr. F. C. Penrose, F.R.S., occupied the chair, and there was a large attendance of members and visitors, including some ladies. The nominations were announced amid applause of Sir Frederic Leighton, P.R.A., and Mr. E. Faulkner as Hon. Fellows of the Institute. The President then read the

OPENING ADDRESS.
